FINAL REPORT

Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

November 28, 2023
Title: Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada
Publisher: National Citizens Inquiry

First Publishing: PDF, English, Canada, November 28, 2023
https://nationalcitizensinquiry.ca/

This title has three volumes:
Volume 1: Executive Summary
Volume 2: Analysis
Volume 3: Transcripts (Volume 3 is further broken out into sections by City.)

Commissioners: Kenneth R. Drysdale
Heather DiGregorio
Dr. Bernard Massie
Janice Kaikkonen

Thank you to the thousands of volunteers across Canada who worked tirelessly to make the hearings possible.
November 28, 2023

To: The National Citizens Inquiry (NCI)

Pursuant to the Mandate and Terms of Reference outlined by the National Citizens Inquiry, we as fully Independent Commissioners have inquired into the appropriateness and efficacy of the interventions undertaken by the governing authorities in Canada, including the federal, provincial, and territorial governments in response to the COVID-19 (C-19) Pandemic.

With this letter, we respectfully submit the first-ever citizen-organized, citizen-funded National Citizens Report.

Independent Commissioners:

Kenneth R. Drysdale                    Dr. Bernard Massie                    Janice Kaikkonen

Heather DiGregorio
Notice to Reader

The Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada (the Report) is presented with the intent to inform and foster understanding regarding the matters discussed herein. It is important for readers to understand that the analysis, conclusions, and recommendations contained in this Report are based solely on the sworn testimony received from the witnesses, who voluntarily appeared before the Commission and testified. The Commissioners have relied upon the truthfulness and completeness of each witness’s testimony as presented. It is and remains the sole responsibility of the witnesses to assure the accuracy and veracity of their testimony.

Readers are cautioned to critically examine each issue presented within this Report, considering the content, intent, and validity of all information contained herein. The Report has been diligently prepared to the best of the Commissioners’ abilities, with deference to the information provided. However, it may not necessarily represent an exhaustive understanding of each topic discussed.

It is important to note that despite invitations extended, no government or regulatory agency participated in the hearings, thereby excluding their direct input from this Report. Consequently, certain additional information that may have been pertinent to the topics discussed herein may have been left out due to the non-participation, refusal, or failure of various government agencies and regulators to engage in this investigative process.

In light of these circumstances, readers are urged to consider these factors and exercise discernment while reviewing this Report. It is vital to approach the content with an open and critical mind, recognizing that this Report may not encompass all relevant perspectives or information.

VOLUME ONE ................................................................................................................ 22

1. Executive Summary ........................................................................................................... 23
   1.1. Introduction ............................................................................................................... 23
   1.2. Reasons for a National Independent Citizens Inquiry ................................................ 27
   1.3. Guiding Principles .................................................................................................... 28
   1.4. Purposes of the National Citizens Inquiry .................................................................... 29
   1.5. Structure of the National Citizens Inquiry ................................................................... 31
   1.6. Selection of Commissioners ....................................................................................... 32
   1.7. Instruction to the National Citizens Inquiry ................................................................. 33
   1.8. Public Hearings ........................................................................................................... 34
       1.8.1. General Principles of the Public Hearings .............................................................. 34
       1.8.2. Locations and Schedule of the Public Hearings .................................................... 35
   1.9. Identification and Classification of COVID-19 Interventions ..................................... 37
   1.10. Assessing the Effects of the COVID-19 Interventions ............................................... 38
   1.11. Assessing the Appropriateness and Efficacy of These C-19 Interventions .................. 39
   1.12. Lessons to Be Learned .............................................................................................. 40
       1.12.1. Recommendations ............................................................................................. 40
       1.12.2. An Ode to Truth and Integrity ............................................................................. 40
   1.13. Conclusions .............................................................................................................. 42

2. The Pandemic .................................................................................................................... 44
   2.1. Overview of the Pandemic ........................................................................................... 44
   2.2. Timeline of Major Events ........................................................................................... 48
       2.2.1. Introduction .......................................................................................................... 48
       2.2.2. Timeline of Basic Events in Canada 2019 .............................................................. 49
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

2.2.3. Timeline of Basic Events Canada 2020 .................................................................50
2.2.4. Timeline of Basic Events Canada 2021 .................................................................52
2.2.5. Timeline of Basic Events Canada 2022 .................................................................54
2.2.6. Timeline of Basic Events Canada 2023 .................................................................56
2.3. Aftermath of Pandemic (2023) .............................................................................57
3. National Citizens Inquiry .........................................................................................60
   3.1. Public Confidence in Government-Led Public Inquiries .....................................60
       Introduction ...........................................................................................................60
       Transparency .........................................................................................................61
       Independence ..........................................................................................................62
       Inclusivity ...............................................................................................................62
       Effective Communication .....................................................................................62
       Implementation of Recommendations ...............................................................62
       Conclusion ............................................................................................................62
   3.2. The Need for an Independent Inquiry .................................................................64
4. Objectives of Inquiry ...............................................................................................65
   4.1. Overall Objects of an Independent Public Inquiry ............................................65
   4.2. The National Citizens Inquiry ............................................................................67
   4.3. The Commissioners ..........................................................................................68
       4.3.1. Role of the Commissioners .......................................................................68
       4.3.2. Independent Commissioners .....................................................................68
       4.3.3. Selection of Commissioners ......................................................................70
       4.3.4. The Commissioners ................................................................................71
   4.4. The Report ..........................................................................................................73
5. Procedures ................................................................................................................75
   5.1. Introduction ..........................................................................................................75
   5.2. The National Citizens Inquiry Organization ....................................................76
       5.2.1. The Commissioners ..................................................................................76
6.3. Detailed Information from the Public Hearings

6.3.1. Truro, Nova Scotia

6.3.2. Toronto, Ontario

6.3.3. Winnipeg, Manitoba

6.3.4. Saskatoon, Saskatchewan

6.3.5. Red Deer, Alberta

6.3.6. Langley, British Columbia

6.3.7. Québec City, Québec

6.3.8. Ottawa, Ontario

6.3.9. Additional Virtual Testimonies

6.4. Exhibit Archive

6.4.1. Truro, Nova Scotia Exhibits March 16, 17, 18, 2023

6.4.2. Toronto, Ontario Exhibits March 30, 31, April 1, 2023

6.4.3. Winnipeg, Manitoba Exhibits April 13, 14, 15, 2023

6.4.4. Saskatoon, Saskatchewan Exhibits April 20, 21, 22, 2023

6.4.5. Red Deer, Alberta Exhibits April 26, 27, 28, 2023

6.4.6. Vancouver, British Columbia Exhibits May 2, 3, 4, 2023

6.4.7. Québec City, Québec Exhibits May 11, 12, 13, 2023

6.4.8. Ottawa, Ontario Exhibits May 18, 19, 20, 2023

6.4.9. Virtual Testimony Exhibits

The rule of law is not only important to ensure that a justice system functions correctly; the rule of law is equally important to maintaining the confidence of Canadians in their justice system.
1. Executive Summary

1.1. Introduction

Canada’s federal, provincial, and municipal governments’ responses to COVID-19 were unprecedented.

The policy, legal, and health authority interventions into the lives of Canadians, our families, businesses, and communities were, and to a great extent remain, significant. In particular, these interventions have impacted the physical and mental health, civil liberties and fundamental freedoms, jobs and livelihoods, and overall social and economic wellbeing of nearly all Canadians.

Given the enormity of these mandates and the resultant consequences, these circumstances demanded a comprehensive, transparent, and objective national inquiry into the appropriateness and efficacy of these interventions to determine what lessons can be learned for the future.

No Canadian government has shown appetite for a fulsome review of the measures implemented. It is also questionable whether municipal, federal, and provincial governments would or could conduct a fair and unbiased review simply because it is their own actions and responses to COVID-19 which should be under investigation.

The preceding description of the genesis of the National Citizens Inquiry represents a somewhat sterile description of the requirement to hold an inquiry into governments’ responses to the “pandemic.” That description, although absolutely valid, was formulated prior to the commencement and subsequent completion of the National Citizens Inquiry hearings.

Those individuals who participated in the hearings or watched even a small fraction of the more than 300 sworn testimonies have had their lives transformed forever. Many of the testimonies were heartbreaking. Others revealed a sometimes terrifying depth to which this nation has fallen. Over the 24 days of hearings, witness testimonies provided an overall sense of how Canada has been transformed by government actions to address the pandemic.

---

1 The word *efficacy* refers to the effectiveness or the ability of the government’s actions and measures to produce the desired outcomes or results in addressing the COVID-19 pandemic. In essence, it evaluates whether the government’s efforts are successful in achieving the desired objectives in the context of COVID-19 response and management.
Our country underwent a dramatic transformation within a short timespan. Sweeping lockdowns and restrictions on rights and freedoms that would once have been considered unthinkable in our country were adopted with incredible speed and with no room for public comment or debate. This was, in and of itself, a phenomenon.

The testimony objectively demonstrates that an unprecedented attack was carried out on the basic rights, freedoms, and way of life of Canadian citizens. Not since World War II have so many lives been lost due to measures imposed on Canadians by their government.

It is important to appreciate that this statement is based on sworn testimonies of the events and experiences described by the witnesses and that these testimonies, as incredible as they are, do not capture the full breadth of the events that took place.

The COVID-19 pandemic, which began in late 2019, presented governments worldwide with an unprecedented opportunity to change the direction of their respective nations. With the official narrative to contain the spread of the virus and prevent healthcare systems from being overwhelmed, many countries resorted to implementing strict non-pharmaceutical interventions.

These interventions, which included widespread business closures, travel restrictions, and stay-at-home orders, were initially introduced as “temporary” and “emergency” measures to mitigate the immediate impact of the virus.

In the early stages of the pandemic, there was a widespread sense of urgency and fear surrounding the unknown nature of the virus. Public Health experts quickly became the face of governments, and citizens were left grappling with the need to balance public safety with individual freedoms. The severity of the situation, as described in government messaging and daily state-media broadcasts, led to a general willingness among the population to accept stringent interventions as a necessary evil.

During these early stages, public health messaging informed Canadians that the primary goal was to “flatten the curve” and prevent healthcare systems from collapsing under the strain of a sudden surge in COVID-19 cases.

Based on the government messaging presented to the public, the notion of lockdowns seemed logical and justifiable to curb the rapid transmission of the virus. Moreover, the suppression of effective existing treatments in favour of the new, experimental genetic therapy “vaccines” further underscored the need for non-pharmaceutical interventions. Canadians have since learned differently. Nevertheless, at the time, the unknowns were still too numerous to ignore the messaging that we now can conclude as biased and inaccurate, similar to, if not actual, propaganda.
Testimony from experts confirmed that by late March of 2020, the government already knew the true nature and risks of the virus known as SARS-CoV-2. The government knew that it primarily affected the elderly and individuals with comorbidities, and they therefore were aware it was not unusually deadly or virulent to the vast majority of Canadians.

Nevertheless, governments persisted in their imposition of emergency measures. As time went on, the long duration of lockdowns and their impact on daily life began to generate debate and dissent. Economies suffered severe contraction and losses, businesses closed permanently, and livelihoods were disrupted. The societal and psychological toll of prolonged lockdowns became increasingly apparent as people grappled with issues such as mental health, educational challenges, and social isolation.

Governments undertook unprecedented levels of spending—a reality that will impact generations of Canadians to come.

Many people lost their lives due to fear, loneliness, and depression. Many others had scheduled surgeries cancelled. The doctor-patient relationship was severed when medical appointments were no longer conducted in person.

Many had adverse reactions to an experimental biologic injection that many were forced to take against their will.

Many people were terrified by the government messaging that increasingly encouraged people to turn on each other. Friends, families, and communities were torn apart. The government resorted to name-calling and public shaming, and in so doing, altered the social fabric. Society, as it was known, had now become toxic and, in many ways, dangerous. As a result, the incidence of suicide, violence, and despair increased to unprecedented levels.

As the pandemic persisted, differences in the way various countries approached the pandemic started to become known. Some nations adopted more targeted and localized measures, while others implemented broad and strict nationwide lockdowns. These varying approaches contributed to a diverse range of experiences and public perceptions.

Citizens began to undertake their own research—coming together and realizing that historical pandemic-management practices and emergency plans, which had withstood the test of time, had been discarded by Canadian governments and replaced with unsupported measures and mandates that appeared to be politically-driven.

Although the government had done extensive emergency planning well in advance of 2020, these emergency plans were simply ignored, and those professionals who were trained to implement emergency measures were sidelined.
In summary, governments in various jurisdictions throughout Canada were able to introduce draconian lockdown measures in a relatively short period of time. Admittedly, governments were not alone in this endeavour. The excuse of combatting a “novel virus” combined with a fear that healthcare systems would be overwhelmed to persuade the public to accept any and all measures that were brought forth.

However, as time progressed, the long-term consequences and societal costs associated with prolonged lockdowns could no longer be hidden from the public.

Claims about consequences and social costs are incredible claims to make. Just three years ago they were unthinkable. Once the reader has had the opportunity to thoroughly review the contents of this Report and watch the recorded testimonies, there is no escaping the validity of these assertions.
1.2. **Reasons for a National Independent Citizens Inquiry**

Canadians demanded an independent inquiry into government responses to the COVID-19 pandemic as a result of a wide variety of considerations that include the following:

1.2.1. The scope and magnitude of the COVID-19 response were/remain unprecedented.

1.2.2. The impacts were national, and the responses of the governments affected the vast majority of Canadians.

1.2.3. Canadians have many legitimate questions concerning how the response was managed and what scientific and policy advice governments relied upon—questions to which the governmental response thus far has been non-existent or unsatisfactory.

1.2.4. Calls for the governments themselves to commission an inquiry have gone unheeded.

1.2.5. The governments cannot be expected to objectively and impartially conduct the required investigation of themselves—hence the need for a National Citizens Inquiry.

1.2.6. It is necessary to solicit, receive, and evaluate first-hand personal testimony from those impacted by governments’ responses to COVID-19. It is important that this testimony be sincere, honest, and free of coercion or censorship.

1.2.7. It is necessary to solicit, receive, and evaluate testimony from scientific, medical, legal, and other appropriate experts that may differ from the narrative communicated by governments and mainstream media.

1.2.8. It is necessary to ascertain where governmental responses to COVID-19 were effective, ineffective, or counterproductive and where alternative methods could have yielded much better or more appropriate results.

1.2.9. It is necessary to establish accountability for the impacts of measures undertaken and to ascertain the social and economic costs of those measures.

1.2.10. It is necessary to ensure that our governments manage any future declared public emergencies effectively and they exercise related emergency orders or powers in a transparent, responsive, democratic, and effective manner.
1.3. Guiding Principles

The National Citizens Inquiry was established under strict guidelines, which include the following:

1.3.1. Independence: The Inquiry must be truly independent. Inquiry Commissioners were selected on the basis of experience, competence, and credibility, and not for any preconceived positions they might hold on the issues dealt with by the Inquiry.

1.3.2. Citizen-Supported: The authority of the Inquiry must rest on a mandate received from significant numbers of Canadian citizens across the country who have made repeated calls for an independent and objective review of governments’ pandemic measures. This mandate was further reinforced by such citizens adding their names to the Petition of Support for a National Citizens Inquiry provided on the Inquiry’s website: www.citizensinquirycanada.ca.

1.3.3. Open and Transparent: The Inquiry’s investigation and related activities were undertaken in an open and transparent basis, free of biases or preconceived conclusions.

1.3.4. Truthfulness: All persons who participated in the Inquiry were only able to submit oral or written testimony under oath, dutifully sworn before the Commission representatives.

1.3.5. Evidence-Based: The deliberations and conclusions of the Inquiry are evidence-based, with any and all testimony received (including that containing extreme claims and conspiratorial charges) being subject to cross examination. The submitted evidence for all arguments, claims, and/or positions are publicly available through the Inquiry’s website.

1.3.6. Respect: The Inquiry insisted that all participants exhibit mutual respect for the evidence, opinions, beliefs, and statements before the commissioners, in accordance with the principles of facilitating reconciliation and healing.
1.4. Purposes of the National Citizens Inquiry

1.4.1. To inquire into much needed dialogue with Canadians. To listen to Canadians concerning the impacts of government health and policy measures impacting their personal lives, including their physical and mental health, families, and communities (particularly children and seniors), jobs and livelihoods, businesses, and their fundamental freedoms and civil liberties as guaranteed by the Constitution.

1.4.2. To invite Canadians to pose to the Inquiry any unanswered or unclear questions concerning COVID-19 and governments’ responses thereto, and for the Inquiry to make all reasonable efforts to secure answers to those questions.

1.4.3. To receive and evaluate testimony from medical, legal, scientific, and other relevant experts concerning the governments’ pandemic measures and strategy, what information was known or knowable by governments, and what, if any, alternative approaches could have been taken.

1.4.4. To receive and evaluate testimony from legacy and independent media to understand what information was known or knowable beforehand and whether the information conveyed to the public was factual, objective, and without bias.

1.4.5. To invite input from healthcare officers and other governmental officials as to the rationale behind the healthcare protection measures adopted—including mandates, lockdowns, and public health orders and actions—and the strategies employed to secure public compliance.

1.4.6. To invite and secure testimony as to the appropriateness, efficacy, legality, and constitutionality of governments’ responses to COVID-19.

1.4.7. To investigate public sector expenditures, grants, and any other subsidies or financial support programs and their distribution related to the governmental responses to COVID-19.

1.4.8. To consider the issue of civic and criminal liability for any damages or harms caused by governments’ responses to COVID-19.

1.4.9. To investigate rulings and judgments against citizens for the personal choices they made, and to investigate institutional policy changes that led to the perception of discrimination.

1.4.10. To make publicly available to Canadians all findings, submissions, and testimonies certified by and formally presented through the Inquiry.
1.4.11. To identify any mistakes, negative impacts, or mismanagement that the Inquiry may determine to have occurred, and if it does so, to recommend appropriate measures for more appropriate and effective government responses in the future.
1.5. **Structure of the National Citizens Inquiry**

The National Citizens Inquiry consists of two main components: the Commissioners and the Support Group.

1.5.1. The Support Group is a purely administrative committee that facilitates the NCI’s logistics, such as booking venues, maintaining the NCI website, or raising funds to support this initiative. The Support Group drafted the initial Terms of Reference for the Inquiry, which were reviewed by the Commissioners. The Support Group had no role in the substantive aspect of the Inquiry (e.g., asking questions of witnesses, considering evidence, or advising the Commissioners).

- The Support Group is represented across Canada through Regional Subcommittees. These committees carried out the local planning and organization needed to host the NCI hearings, accommodate witnesses, and provide logistical support to the Commissioners.

- Support Group and Regional Subcommittee members were all unpaid volunteers who stepped forward from across Canada and all walks of life.

1.5.2. The Commissioners were solely responsible for hearing testimony, asking questions, and issuing a comprehensive report inclusive of recommendations, if any.

- The NCI’s Commission consisted of four Commissioners. The Commissioners elected a Chair to lead the Commission.

- Commissioners were solely responsible for hearing witness testimony and preparing this Report.

- The Commissioners were identified by Canadians and reviewed and appointed by the Support Group on the basis of their credibility, demonstrated objectivity, and competence in one or more relevant areas (e.g., law, medicine, science, ethics, public policy, journalism, etc.). It was essential that the Commissioners be objective and non-biased.

- Commissioners were supported by a Secretariat staff comprised of lawyers and other professionals.

- Upon the conclusion of the hearings, the Commissioners have written this Report.
1.6. Selection of Commissioners

It was critical that selected Commissioners were, and are, seen to be credible in all regards and in particular that they were, and are, as objective, competent, and trustworthy as possible to Canadians on whose behalf the Inquiry was conducted.

The invitation to nominate or apply to be a Commissioner was posted on the Inquiry’s website (www.citizensinquirycanada.ca). The posting included a brief description of the nominees’ desired characteristics (e.g., independence, objectivity, competence, etc).

Nominations/Applications were received and evaluated, and those who were most qualified to serve were invited to do so. Commissioners signed a Declaration of Understanding and Neutrality indicating that they accepted the Inquiry’s Terms of Reference and commitment that their conclusions and recommendations would not be pre-determined but would be based solely on testimony provided to the Inquiry. The names and biographies of the selected Commissioners are posted on the Inquiry’s website.

The Commissioners selected their own Chairperson, Ken Drysdale.
1.7. Instruction to the National Citizens Inquiry

The National Citizens Inquiry was instructed and authorized to carry out the following:

1.7.1. To include the activities of all levels of government (federal, provincial, and municipal) within the scope of its investigations.

1.7.2. To complete its investigations and to issue a final report of its findings and recommendations within one year of the commencement of its operations.

1.7.3. To adopt such procedures and methods as it may consider necessary for the proper conduct of the Inquiry. While the Inquiry is not a court, the Commissioners adhered to court-like procedures with respect to receiving evidence (e.g., instructions to witnesses, cross examination) and legal counsel.

1.7.4. To sit at such times and places in Canada, as it may decide, for the purpose of holding in-person hearings, to conduct virtual hearings as necessary, and to receive written as well as oral testimony.

1.7.5. To seek additional input and advice from experts and grassroots sources as deemed necessary.

1.7.6. To issue interim reports as well as a final report and such other communications as the Commission considers necessary to keep the public apprised of its work and to correct any misconceptions or misrepresentations thereof.

1.7.7. To understand that its interim and final reports are the primary output of the Inquiry, which the Commissioners must be prepared to publicly explain and defend.

1.7.8. To immediately upon its formation establish a system to account for the revenues used to finance the operations of the Inquiry and the expenses incurred, and to make this accounting public at the conclusion of the Inquiry.
1.8. Public Hearings

1.8.1. General Principles of the Public Hearings

The Public Hearings were conducted under the following Rules and Procedural Principles:

1.8.1.1. Proportionality: The Inquiry allocated investigative and hearing time in proportion to the importance and relevance of the issue to the Inquiry's mandate and the time available to fulfill that mandate so as to ensure that all relevant issues are fully addressed and reported on;

1.8.1.2. Transparency: The Inquiry proceedings and processes were carried out in a manner that was as open and available to the public as was reasonably possible, consistent with the requirements of national security and other applicable confidentialities and privileges;

1.8.1.3. Fairness: The Inquiry balanced the interests of the public's right to be informed with the rights of witnesses testifying to be treated fairly;

1.8.1.4. Timeliness: The Inquiry proceeded in a timely fashion to engender public confidence and ensure that its work remained relevant; and

1.8.1.5. Expedition: The Inquiry operated under a strict deadline and conducted its work accordingly.

Detailed Rules of Practice and Procedure are available on the NCI Website:

1.8.2. Locations and Schedule of the Public Hearings

Public Hearings were held in locations from coast-to-coast in Canada as follows:

- Truro, Nova Scotia  March 16, 17, 18, 2023
- Toronto, Ontario  March 30, 31; April 1, 2023
- Winnipeg, Manitoba  April 13, 14, 15, 2023
- Saskatoon, Saskatchewan  April 20, 21, 22, 2023
- Red Deer, Alberta  April 26, 27, 28, 2023
- Vancouver, British Columbia  May 2, 3, 4, 2023
- Québec City, Québec  May 11, 12, 13, 2023
- Ottawa, Ontario  May 17, 18, 19, 2023

Members of the public who wished to testify at the hearings were invited to apply through online application forms that were available on the NCI website:

https://nationalcitizensinquiry.ca/testimony/

Members of the public were offered the option of testifying in person or via live video broadcast.

Over 900 members of the public (lay witnesses) applied to testify. One hundred forty-seven expert witnesses applied or were nominated to provide testimony (some were nominated more than once).

Approximately 300 members of the public testified at the hearings.

Many more members of the public are currently providing additional testimony outside of the Public Hearings, which will similarly be included in the Commission Record, but which will not form part of the record considered when preparing this Report.

Testimony was “invited” from representatives of all provincial/territorial and federal levels of governments across Canada. Subpoenas were issued and government witnesses were given the option of testifying either in person or on video conference at any of the eight hearing locations.

Sixty-three members of government, regulators, and authorities were subpoenaed to attend and testify.

Not one representative of any government in Canada appeared to testify at the public hearings. All subpoenas sent were either ignored, declined, or not picked up.
As a result of the lack of government representation at the hearings, the Commissioners were unable to hear governments’ defences of their measures. The inquiry sought to obtain government positions through the consideration of non-oral evidence, such as sworn affidavits of government officials—obtained from various court proceedings. Where such materials have been considered, they form part of the official record. It was this sworn evidence as well as their actions, press releases, statements of policy, and press conferences that were utilized to represent government positions.

Actual recorded statements and press conferences, et cetera, were aired at a number of the hearing locations.

Despite the fact that the actions taken by all levels of government represented the most profound intrusion into the lives of all Canadians, not a single government representative took the opportunity to address the Canadian people and explain their side of the story.

As a citizen-led initiative, the Commission did not have the ability to compel the government witnesses to appear through judicial subpoenas.
1.9. Identification and Classification of COVID-19 Interventions

For the purposes of this Report and based on the testimony provided at the Public Hearings, the COVID-19 measures that were implemented by governments were summarized into four major categories. The categories are based on the actual or perceived effects that the measures had on the lives of Canadians.

There is significant overlap between each of these categories. It’s important to note that the particular expertise and knowledge of each Commissioner may be reflected and embedded differently within this overlap, as well as each Commissioner’s personal and professional response to witness testimony. This is intentional and deliberate so that the voices of all Canadians can be fully represented in this Report.

The major categories are:

1.9.1. **Social**, meaning those measures that largely impacted the social fabric and interaction of Canadians in their daily life activities. These include measures that restricted public meetings, movement, and ability to interact and meet with other people.

1.9.2. **Civil**, meaning those measures that impacted the civil rights and freedoms of Canadians, including the imposition of restrictions by the governing authorities and, as well, the imposition of forced mandates by both government and non-government entities. These impacts were assessed at the personal, institutional, and organizational level.

1.9.3. **Economic**, meaning those measures that impacted the economic wellbeing and performance of individuals, businesses, and organizations in Canada. These could include restrictions to employment, the shutdown of businesses and organizations deemed non-essential, and the overall impacts of the measures on our society as a whole.

1.9.4. **Health**, meaning those measures that impacted the health and wellbeing of citizens of Canada. These issues might include such things as forced medical procedures, lack of access to patients because of the mandates: many doctors were treating via zoom, and injuries resulting from forced medical procedures and isolation.
1.10. Assessing the Effects of the COVID-19 Interventions

This Report relies on the testimony of the witnesses to assess the effects of the COVID-19 interventions. The interventions have been grouped into two basic categories as follows:

**Pharmaceutical Interventions**

This Report defines a “pharmaceutical intervention” as a course of treatment to help prevent, control, or mitigate a pandemic through the use of over-the-counter or healthcare provider prescription medication. This might include such things as vaccine, anti-virals, and antibiotics.

**Non-Pharmaceutical Interventions**

This Report defines a “non-pharmaceutical intervention” (NPI) as a course of action taken either by individuals or communities to help prevent, control, or mitigate a pandemic through the use of other means, excluding over-the-counter or prescribed medications. This might include the implementation of masking policies, lockdowns, closures of public facilities, and quarantines.

Actual first-hand testimony of witnesses describes how each of the measures affected them personally or how they have been involved in the evaluation of the interventions.

Transcripts of the testimonies, grouped into the various hearing locations are provided in Volume 3 of this Report. The actual recorded testimonies, transcripts, and submitted evidentiary exhibits are also provided on the NCI website.
1.11. Assessing the Appropriateness and Efficacy of These C-19 Interventions

Assessment of the appropriateness and efficacy of the interventions is based on the outcomes observed.

Testimonies from physicians, scientists, researchers, statisticians, legal scholars and practitioners, lawyers, judges, teachers, commentators, and Canadians from all walks of life were used to assess the appropriateness of the interventions.

The Commission heard from a wide variety of witnesses, from locations across Canada and beyond, with a diversity of expertise and experience.

At times, testimony was limited as certain witnesses would not testify out of fear of reprisals. In addition, since all representatives of government either refused to appear or simply would not acknowledge the subpoena, their testimony was never heard.

This Report relies on first-hand testimony received from everyday Canadians and from leading experts in a wide range of fields of study.
1.12. Lessons to Be Learned

1.12.1. Recommendations

Detailed analysis and commentary on each aspect of the pandemic response is provided in “Section 7. Analysis” of the Report. The Commissioners set out and describe each area of review, reference some of the testimony upon which the analysis and commentary is based, provide conclusions based on that analysis, and then provide specific recommendations to address the issues identified.

In “Section 8. Recommendations,” for ease of reference, the recommendations set out in “Section 7. Analysis” are itemized and presented in a simple format.

Recommendations vary widely depending on the subject under consideration. There were no restrictions or limitations placed on the scope or nature of the recommendations made.

1.12.2. An Ode to Truth and Integrity

Collectively, we’ve been paying too much deference to our material comfort, and not enough to truth. Accommodation with half-truths, lies by omission, blatant lies, or complicit silence has created a culture in which the institutions have gradually rotted from within. The COVID-19 crisis has revealed that our Western societies are on the slippery slope towards totalitarianism that cannot happen without the consent and the active participation of the governed. We are all responsible for what’s happening, one way or another.

Without clear separation of powers between independent institutions—the executive branch of government, the administrative branches of government, the judiciary, and healthcare providers—there can be no proper checks and balances. These checks and balances are essential to foster a culture of accountability. Without proper accountability, society is left at the mercy of incompetence and corruption working hand-in-hand to maintain and strengthen the power of the institutions in place.

Restoring a vibrant culture of accountability and thriving on truth is the only way to rebuild the most important asset of a prosperous and benevolent society: trust. Trust cannot be demanded; it has to be earned by word of truth and integrity of actions.

One of the gravest dangers in democracy is the tyranny of the majority that has forgotten the primordial importance of truth and liberty grounded in individual responsibilities that cannot and should not be outsourced to the administrative state. Unless a true safe space is created for the flourishing of new ideas, freely challenged by rigorous debates, societies will eventually crumble in obsolescence.
The relentless search for truth, which is the best possible alignment with the laws of nature, is not a democratic endeavour in and of itself. Before becoming widely accepted, a new scientific discovery (or a new, potentially truthful idea), is unique and cannot be subjected to the vote of the majority that is completely oblivious to this new truth initially. If we kill these new ideas before they have the chance to be accepted widely, we will impede the progress of society.

The only way to confirm if a new idea, a discovery, or a hitherto unknown law of nature is really true is to subject it to the free exchange of ideas in debates. Not to censor it arbitrarily by fiat, bringing forward an ill-proclaimed scientific consensus.

Consensus is a way of functioning when much uncertainty remains, and yet a decision has to be made, especially in a state of perceived emergency. Crisis occurs when institutions are poorly managed or somebody wants to take advantage of imposing decisions without proper vetting, using the pretext of emergencies, real or perceived. When society is in a constant state of crisis, one has to question the competence and/or the motives of the ruling class, including the administrative state.

We have to protect as sacred the path and the institutions that have been used for centuries in the rigorous scientific process. Money and corresponding institutions should facilitate this process, not subjugate it.

People working as unelected officials in the administrative state should not end up being the masters of our destiny but rather the civil servants of the institutions at the service of the people.

We are learning the hard way that dysfunctional institutions can and will fail us when we need them the most. As engaged citizens, we must embark and take part in a major reform of our institutions and not leave it to elusive others. Let’s not be discouraged by the magnitude of the tasks at hand.

We owe it all to our children and grandchildren.
1.13. Conclusions

**Administrative State: Is the State benevolent or guilty of malfeasance?**

As the famous Nobel laureate physicist, Steven Hawking, judiciously said: “The greatest enemy of knowledge is not ignorance, it is the illusion of knowledge.”

In Canada, the administrative state used—and continues to use—the illusion of knowledge to maintain power. This was evidenced throughout the three-year COVID-19 experience when bureaucrats and administrators alike were perceived as all powerful. However, this illusion was only an image accomplished through an elaborate and inextricably intertwined web of deceit, much like the tactics of the sorcerer’s apprentice. Meanwhile, politicians were more than happy to impose popular but ill-advised, half-baked health measures, justifying these emerging policies as well-intended measures to protect public health.

Sadly, the majority of people succumbed to the measures out of fear, a lack of unbiased and objective information, and questionable trust in long-standing institutions.

In this context, as long as most people perceive benefits from the government narrative, everything will be done to protect the illusion of the effectiveness of the ill-advised health measures.

But as we witnessed, the administrative state, to achieve this end, relied on poor modelling and statistics full of omissions while ignoring scientific knowledge and understandings. The administrators also dismissed the wisdom of true experts who have credentials considerably above the pretended expertise of technocrats who systematically censored any dissenting voices threatening their usurped authority.

This is best illustrated by the numerous accounts of ignorance of epidemiology; their ineffective, unjustifiable non-pharmaceutical interventions (NPIs); their willful ignorance of state-of-the-art medical practice; and last but not least, their superficial knowledge of the intricacies of the immune system.

The only way out of this conundrum is through our constitutionally protected freedom of speech, wherein widely held beliefs, thoughts, and opinions are respected, and likewise, conversations, debates, and dissenting voices are heard. This should be particularly true in the scientific and medical professions.

We know the very essence of society is human interactions, and embedded therein, relationships. Because human societies thrive on narratives that present distorted views of reality and define culture according to unwritten rules, new narratives need to emerge. These are particularly critical when societies face a major crisis, like a pandemic. Sometimes, low-resolution representations of reality need to be updated and subsequently redefined by rigorous debates to orient better decision-making and implement more effective solutions to vexing problems going forward.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

This Report is an attempt to craft a more balanced and objective narrative based on the hundreds of testimonies heard during the 24 days of hearings across Canada. Why? Because Canadians deserve to hear the concerns raised and to determine their own informed opinions regarding the health crisis we have just faced and the appropriateness of the mitigation measures used by government authorities. It will be up to readers to determine for themselves whether this new narrative is a more comprehensive representation of reality than the messaging delivered by governments and the mainstream media during the three years of the COVID pandemic.

Specifically, this Report examines the health, civil, economic, and societal issues resulting from the COVID-19 response. The Report also makes specific recommendations to improve the management of any future health crises.

What, How, and Why?

This Report focuses on answering questions that are in the realm of scientific and forensic investigations. “What” happened? “How” did it happen? And although the “why” deserves attention too, the Commissioners have determined that it is beyond the scope of this investigation. Still, this existential question will undoubtedly be the subject of many scholarly books for decades to come.

By way of further explanation, asking why is certainly not mundane to the Inquiry as it strikes many sensitive cords for most people, whether philosophically, psychologically, or spiritually. However, going down that slippery slope can lead into a maze where one looks for ulterior motives, where there arises a need for, or requires, soul-searching and psychological discussion, which is outside the borders of rigorous scientific investigations. Attributing motive is not part of the playbook of the scientific method.

What is required are open and honest debates to foster our collective understanding of what happened and how it happened. In any healthy debate, one has to stay focused on the data, the information, and the knowledge before the wisdom can blossom. This is why forensic investigations are critical—so that conclusions can be reached, apart from agendas and ulterior motives.

It is for this reason that the Commissioners have agreed to abide by the witness testimonies to the best of their ability in seeking the truth. These are the truths we have sought throughout the hearings. Moreover, through engaging in this cross-country experience, we can come together as a nation, restoring the very principles and freedoms that have defined Canada since 1867.
2. The Pandemic

2.1. Overview of the Pandemic

The COVID-19 pandemic was presented by governments and corporate media as a global health crisis that emerged in late 2019; and it significantly impacted nearly every aspect of life around the world.

Following is a brief overview of the key aspects of the pandemic:

The pandemic is believed to have started in December 2019 in Wuhan, Hubei Province, China. The virus responsible for the disease was identified as a novel coronavirus, named SARS-CoV-2.

The virus quickly spread globally through human-to-human transmission, facilitated by international travel. The World Health Organization (WHO) declared it a public health emergency of international concern in January 2020. Later, in March 2020, the WHO further designated it as a pandemic.

On March 11, 2020, when the WHO declared the “pandemic,” Canada, a nation of approximately 38.5 million people, had reported only one death—that of an 80-year-old man—from COVID-19. At the same time, 125 laboratory-confirmed cases were reported.

By the end of March 2020, there was already evidence that COVID-19 mainly affected elderly patients or individuals with pre-existing health issues (comorbidities) and that young healthy citizens did not face a significant risk of death or serious illness from COVID-19.

COVID-19 primarily affects the respiratory system and manifests with a range of symptoms, including fever, cough, difficulty breathing, fatigue, and loss of taste or smell. In severe cases, pneumonia and organ failure are manifestations. It was initially believed to spread mainly through respiratory droplets when an infected person coughs, sneezes, or speaks. It can also be transmitted by touching contaminated surfaces and then touching the face. Aerosol transmission has been confirmed.

Governments and health authorities across Canada implemented various public health measures to mitigate the spread of the virus. These measures included widespread testing, contact tracing, quarantines, travel restrictions, social distancing, face mask mandates, and hygiene practices such as hand washing and sanitizing.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

These NPIs were designed, planned, and implemented by public health authorities across Canada. The emergency measures organizations that are tasked with responding to emergency situations in Canada were sidelined, despite the fact that these organizations were specifically and extensively trained to evaluate, plan, and execute emergency response across Canada.

These NPIs were implemented with grave consequences to the people of Canada. Most notably, previously prepared influenza pandemic plans, including a paper authored by Dr. Theresa Tam specifically advising against lockdown measures, were ignored.

It is critically important to further understand that existing protocols for the treatment of SARS-CoV-2-type infections with pharmaceutical interventions were immediately restricted. This was despite the recommendation of Health Canada’s influenza pandemic plan and the wide availability of inexpensive, effective, and existing pharmaceutical interventions.

Healthcare providers were advised not to treat symptoms of COVID-19 until they were severe enough to require hospitalization and were explicitly instructed not to prescribe pharmaceutical medications such as ivermectin and hydroxychloroquine. Many physicians, nurses, and healthcare practitioners were punished, suspended or lost their licences to practise for prescribing these specific medications. The Canadian mainstream media aggressively promoted all public health measures, embarking on a continued program of cancellation and/or humiliation of any professional that questioned those measures.

The direct actions of the governments in response to COVID-19 put a significant strain on healthcare systems globally.

This strain was ironically not due to illness from COVID-19 itself, as COVID-19 cases did not generally overwhelm hospitals or lead to widespread shortages of medical equipment, beds, and healthcare workers. Admittedly, in some regions, healthcare systems struggled to provide adequate care to both COVID-19 patients and those with other health conditions, but that was due primarily to two factors. The first was governments’ shutdown of healthcare facilities. The second emerged as a consequence of the subsequent suspension and dismissal of healthcare workers who refused to accept the injection that was presented as a “safe and effective” vaccine.

Numerous witnesses from the healthcare field testified that hospitals and emergency rooms were “quiet” throughout most of 2020, and it was not until the widespread rollout of the experimental gene therapy referred to as vaccines that the emergency rooms noted increased patient uptake. Many of these later visits to hospitals included alleged vaccine-injured patients or patients whose medical conditions had gone untreated due to their fear of contracting COVID-19. Witnesses referred to this time as flight or fright. In other words, the nation’s engagement was in a state of paralysis.

Albeit, as the evidence revealed, the hospitals in Canada were never overwhelmed. The two weeks to flatten the curve never changed the ability of hospitals to deliver medical services.
As indicated earlier, the effects of these cited government interventions during the pandemic had far-reaching economic consequences, with businesses facing closures, job losses, and economic downturns. Many industries, such as travel, hospitality, and retail, were severely affected. Government interventions, such as stimulus packages and financial aid, were implemented to mitigate the economic impact. The pandemic interventions also disrupted education systems, led to the cancellation or postponement of events, and changed the way people work and interact.

The unprecedented nature and magnitude of government interventions resulted in a massive expansion of Canada’s national debt. Both the short-term and long-term effects of these measures will undoubtedly be felt for generations to come.

In an unprecedented global effort, multiple experimental gene therapies were developed and presented to the public as safe and effective vaccines. In Canada, these vaccines were approved for use on the public under a newly created approval process that did not require the manufacturers to prove either safety or effectiveness. No specific testing for adverse medical effects of the vaccines on seniors, pregnant and/or nursing women, or children was required or performed prior to the approval and recommendation of vaccines for these groups. Nor were the vaccines evaluated for medium- or long-term safety or efficacy prior to approval.

This was in addition to the fact that the mRNA technology had never been previously used in wide-scale human populations. Subsequently, the clinical trials were compromised after only two months of monitoring when, in the Pfizer trial, the placebo arm was offered to be vaccinated, thereby losing the control group for longer-term efficacy and safety assessment.

These experimental injections were approved by Health Canada in spite of the significant safety warnings that were evident both during the initial trials and during the post-marketing analysis completed in February 2021. Not only were the safety signals ignored, Health Canada did not have the authority to revoke the approval of the vaccines in any event under the newly created approval process, even if safety signals were identified.

The vaccines were rolled out to Canadians in late 2020 in spite of the significant shortcomings. Vaccination campaigns became the focus of public health and the media, with every Canadian being encouraged to get a safe and effective injection, regardless of their age or individual health circumstances.

In late 2021, the federal government announced that vaccines would be required for travel throughout the country. The provinces each adopted some form of vaccination pass requiring people to prove they had received the requisite number of injections in order to access basic services and businesses.

The federal government announced vaccine mandates for all employees in federally regulated industries, and many Canadian employers put their own mandates in place. Canadians who refused the injections were vilified, ridiculed, bullied, lost their jobs, and were restricted from participating in society.
The vaccines were mandated although they did not prevent infection, did not prevent spread, did not prevent death, and caused significant adverse effects, including death.

As the virus continued to spread, new variants were reported with different characteristics, including increased transmissibility, yet decreased mortality. These variants posed challenges to the effectiveness of the vaccines as the naturally mutating virus developed resistance to the initially distributed vaccine.

Throughout the pandemic, traditional scientific research, collaboration, and communication should have played a crucial role in understanding the virus, developing treatments, and guiding public health responses.

Instead, traditional scientific method and discourse were severely censored. Only government and media narratives were permitted. Researchers and healthcare practitioners who presented alternative evidence were ridiculed and publicly shamed, and in some cases, lost their funding or employment.

Never in the course of modern medicine or scientific practice has this type of censorship happened on such a scale.

Censorship and attacks on medical and scientific process have occurred in the past but never at this level.
2.2. Timeline of Major Events

2.2.1. Introduction

In presenting this Report, the Commission recognized the importance of including a basic timeline of major events during the COVID-19 pandemic. This timeline serves as a backbone, a framework that can help readers more fully understand the sequence of events, the scale and speed of the pandemic, and government responses over time.

The data included in this brief timeline was derived from witness testimony, publicly available information, governmental reports, press releases, and announcements made by the Government of Canada and relevant health authorities during the specified years 2019 through 2022. This information encapsulated key events, mandates, and guidelines related to the COVID-19 pandemic and reflected Canadian responses to the evolving situation during the specified years. It is essential to note that the information is subject to updates and revisions. Cross-referencing with official government sources is encouraged for the most accurate and current details.

The COVID-19 pandemic was a complex and multifaceted crisis that unfolded rapidly, with new developments often arriving in quick succession. For those living through it, the pace of change, combined with the volume of information and guidance issued, could sometimes make it difficult to gain a clear, coherent understanding of the unfolding situation.

By distilling the major events into a concise timeline, we offer a simplified overview of the pandemic’s progression, as well as the corresponding measures and mandates that were put into place by the government. This at-a-glance summary allows readers to grasp the chronology, see the relationship between different events, and understand the context in which decisions were made and actions were taken.

Moreover, it provides a basis for more in-depth analysis. Readers can use the timeline to trace the progression of measures taken by the government and relate them back to the individual testimonies, expert analyses, and policy discussions presented elsewhere in the Report. In this way, the timeline becomes an essential tool for understanding the broader narrative of Canada’s experience of the COVID-19 pandemic.

In short, the timeline helps to make a complex and turbulent period of history more comprehensible, enabling readers to better understand and interpret the wealth of evidence and perspectives presented in this Report.
2.2.2. Timeline of Basic Events in Canada 2019

Following is a brief timeline of the events related to the COVID-19 pandemic in Canada in 2019. Please note, however, that the virus which causes COVID-19 was not identified until late 2019 and the first case of COVID-19 in Canada wasn’t reported until January 2020. Still, this timeline provides a perspective on the initial global unfolding of the COVID-19 pandemic and the beginning responses:

March 31, 2019: Canada reported a federal national debt of $685.5 billion.

December 31, 2019: The World Health Organization (WHO) China Country Office was informed of cases of pneumonia of unknown etiology detected in Wuhan City, Hubei Province of China. At this stage, COVID-19 has not yet been identified and is not yet known to Canada or the rest of the world.

Prior to this, Canada’s Public Health Agency was operating under standard infectious disease monitoring protocols. As 2019 ended, however, and more information about the outbreak in Wuhan became available, the situation began to change rapidly, and by early 2020, COVID-19 was declared a global pandemic.

In terms of pandemic preparedness, the Government of Canada had in place the Public Health Agency of Canada, established in 2004 in response to the SARS outbreak. This agency was tasked with coordinating responses to public health emergencies. However, the specific guidelines and mandates related to COVID-19 wouldn’t come into play until 2020.
2.2.3. Timeline of Basic Events Canada 2020

Following is a basic timeline of some of the key events, mandates, and guidelines issued by Canadian governments in response to the COVID-19 pandemic in 2020. This is not an exhaustive list but provides an overview of the major developments:

**January 25, 2020:** Canada reports its first case of COVID-19 in Toronto, Ontario.

**March 11, 2020:** The World Health Organization declares COVID-19 a global pandemic.

**March 13, 2020:** Many provinces, including Ontario and Québec, announce school closures.

**March 14, 2020:** The federal government urges Canadians currently abroad to return home as soon as possible.

**March 16, 2020:** Canada advises against non-essential travel and begins to implement enhanced screening measures at airports.

**March 18, 2020:** The Canada–U.S. border is closed to non-essential travel.

**March 23, 2020:** Non-essential businesses are ordered to close in many provinces, including Ontario.

**March 25, 2020:** The Canadian Parliament passes an emergency fiscal stimulus in response to the economic impact of the pandemic, establishing the Canada Emergency Response Benefit (CERB).

**March 31, 2020:** Canada reports a federal national debt of $721.4 billion.

**April 6, 2020:** Canada surpasses 15,000 “cases” of COVID-19.

**May 8, 2020:** The unemployment rate increases up to 13 per cent, the second-highest figure on record in Canada.

**April 9, 2020:** Ottawa projects 4,400 to 44,000 Canadians could die of COVID-19. Federal government announces more than one million people lost their jobs in March.

**April 15, 2020:** Wearing masks in public places where social distancing is not possible is recommended by the Public Health Agency of Canada.

**May 19, 2020:** Some provinces, including British Columbia and Manitoba, begin to lift restrictions and enter phase one of reopening.

**June 2020:** Many provinces, including Ontario and Québec, move to phase two of reopening, with certain businesses and public spaces allowed to open with restrictions.

**July 28, 2020:** Remdesivir becomes the first drug to be approved by Health Canada for treatment of patients with severe COVID-19 symptoms.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

**September 2020:** Most schools reopen for in-person learning with new safety measures in place, including mask mandates and physical distancing.

**October 2020:** Second wave begins across Canada, resulting in increased restrictions and, in some provinces, the reimplemention of lockdown measures.

**November 10, 2020:** The Manitoba government forces non-essential stores to close and bans social gatherings in an effort to stop a surge of COVID-19 cases.

**November 26, 2020:** Federal health officials say Canada has purchase agreements with seven COVID-19 genetic vaccine producers.

**December 9, 2020:** Health Canada approves the Pfizer-BioNTech vaccine for use under an Interim Order.

**December 14, 2020:** The first doses of the Pfizer-BioNTech vaccine are administered in Canada.

**December 23, 2020:** Health Canada says the COVID-19 genetic vaccine from USA biotech firm Moderna is safe for use in Canada, and the use of this COVID-19 genetic vaccine is authorized in Canada.

This timeline provides an overview of some of the key moments in the Canadian response to the COVID-19 pandemic throughout 2020. It was a year characterized by swift and significant changes as the country grappled with a new and evolving public health crisis. The data was obtained from a variety of sources.
2.2.4. Timeline of Basic Events Canada 2021

Following is a timeline that captures some of the major events, mandates, and guidelines that Canadian governments issued during 2021 in response to the COVID-19 pandemic. This is not exhaustive, but it covers significant developments:

January 7, 2021: Canada surpasses a cumulative total of 600,000 cases of COVID-19, which include active infections as well as all recovered individuals since the beginning of 2020.

January 12, 2021: Canada signs agreement with Pfizer to purchase 20 million doses of COVID-19 genetic vaccine.

January 23, 2021: Health Canada confirms it has approved a rapid COVID-19 test from Spartan Bioscience for use across the country. The company previously recalled its rapid testing technology—last spring—over concerns expressed by the federal agency.

January 26, 2021: The federal government suspends flights to Caribbean destinations and Mexico in an effort to curb the spread of COVID-19.

February 5, 2021: The AstraZeneca vaccine is approved for use in Canada under an Interim Order.

February 10, 2021: Public Health Canada signs a contract with Telus to track cell phone location data of Canadians.

February 22, 2021: Travellers are required to submit contact information using ArriveCAN app at border crossings.

February 28, 2021: Pfizer Cumulative Analysis of Post-Authorization Adverse Event Reports are completed.

March 5, 2021: Canada surpasses a cumulative total of 900,000 cases of COVID-19, which includes active infections as well as all recovered individuals since the beginning of 2020.

March 29, 2021: Canada recommends immediate pause in the use of AstraZeneca vaccine for persons under 55 years of age.

March 31, 2021: The National Advisory Committee on Immunization (NACI) recommends pausing the use of the AstraZeneca vaccine in individuals under 55 due to reports of rare blood-clotting events.

March 31, 2021: Canada reports a federal national debt of $1.0487 trillion.

May 5, 2021: The Pfizer vaccine is authorized for use in children aged 12 and up.

June 17, 2021: Canada surpasses a cumulative total of 1.4 million cases of COVID-19, which includes active infections as well as all recovered individuals since the beginning of 2020.
July 5, 2021: Canada allows individuals that it deems “fully vaccinated” to travel while continuing to restrict travel for everyone else.

August 13, 2021: The government announces that all federal employees must be vaccinated.

August 31, 2021: Health Canada announces that ivermectin is not an approved treatment for COVID-19.

September 7, 2021: Canada starts allowing foreign tourists, that it considers fully vaccinated, to enter Canada.

October 30, 2021: Proof of vaccination becomes mandatory for travel on planes, trains, and cruise ships within Canada.

October 29, 2021: The Government of Canada mandates COVID-19 genetic vaccines for all employees of federal public services and federally regulated industries, including banking.

October 30, 2021: Health Canada approves the pediatric Pfizer vaccine for children aged 5 to 11.

November 9, 2021: Health Canada authorizes the use of Pfizer vaccine as a booster shot.

November 19, 2021: Canada surpasses a cumulative total of 1.7 million cases of COVID-19, which includes active infections as well as all recovered individuals since the beginning of 2020.

November 19, 2021: Health Canada authorizes Pfizer vaccine for children 5 to 11 years of age

December 14, 2021: The omicron variant is identified in Canada.

This timeline offers an overview of the key milestones in Canadian handling of the COVID-19 pandemic throughout 2021. This year saw continued challenges but also significant progress, particularly with the rollout of vaccines and the implementation of vaccination policies.
2.2.5. Timeline of Basic Events Canada 2022

Following is a timeline encapsulating some of the key events, mandates, and guidelines issued by Canadian governments in response to the COVID-19 pandemic in 2022. This is not a comprehensive list but provides an overview of the primary developments:

**January 7, 2022:** Canada surpasses a cumulative total of 2 million cases of COVID-19, which includes active infections as well as all recovered individuals since the beginning of 2020, amid a surge driven by the omicron variant.

**January 15, 2022:** Ontario and Québec implement stricter measures and lockdowns due to the rapid spread of the omicron variant.

**January 15, 2022:** Public Health Agency of Canada announces that unvaccinated or partially vaccinated foreign national truck drivers coming from the USA by land will not be allowed entry.

**January 28, 2022:** Public Health Agency of Canada recommends children 5 to 11 receive a complete 2-dose primary series of Pfizer pediatric vaccine, and 12 to 17 receive a primary series of vaccines.

**February 14, 2022:** The Canadian Governor in Council directs that a proclamation be issued pursuant to subsection 17(1) of the *Emergencies Act* declaring that a public order emergency exists throughout Canada that necessitates the taking of special temporary measures for dealing with the emergency.

**February 22, 2022:** The federal government announces plans to lift pre-arrival COVID-19 testing for vaccinated travellers by the end of February.

**March 2, 2022:** Health Canada approves the Novavax COVID-19 protein-based vaccine for use.

**March 21, 2022:** Most provinces lift the majority of their COVID-19 restrictions, including indoor capacity limits and proof of vaccination requirements.

**March 31, 2022:** Canada reports a federal national debt of $1.1345 trillion.

**April 5, 2022:** New recommendations announced for a 4th dose (booster) for those aged 80 and older and residents of long-term care/congregate senior living settings.

**April 6, 2022:** The federal government announces a transition from a pandemic response to endemic management of COVID-19.

**May 1, 2022:** The federal government lifts the mandate on wearing masks in federal facilities and on public transportation.

**June 20, 2022:** Canada surpasses 80 per cent full vaccination rate for individuals aged 12 and over.
June 20, 2022: Vaccination will no longer be a requirement to board a plane or train in Canada.

June 20, 2022: Employers in the federally regulated air, rail, and marine sectors are no longer required to have mandatory vaccination policies in place for employees.

August 30, 2022: Schools reopen for the new academic year with minimal COVID-19 restrictions in place.

October 1, 2022: International visitors to Canada no longer have to show proof of vaccination.

October 5, 2022: Health Canada approves a COVID-19 genetic vaccine for children under the age of five.

November 15, 2022: The federal government announces a booster vaccine campaign for all adults.

December 2022: Health Canada admits to monitoring 33 million Canadians’ cell phone data for tracking purposes.

December 31, 2022: Canada surpasses a cumulative total of 2.5 million cases of COVID-19, which includes active infections as well as all recovered individuals since the beginning of 2020.

This timeline offers a snapshot of Canadian management of the COVID-19 pandemic in 2022. The year was marked by the challenges of new variants but also significant advancements in vaccination efforts and a gradual return to a sense of normalcy.
2.2.6. Timeline of Basic Events Canada 2023

Following is a timeline encapsulating some of the key events, mandates, and guidelines issued by Canadian governments in response to the COVID-19 pandemic in 2023. This is not a comprehensive list but provides an overview of the primary developments:

**January 2023:** Canada continues with its booster vaccine campaign for all adults, aiming to strengthen population immunity against COVID-19.

**February 2023:** The government releases new guidelines for managing COVID-19 as an endemic disease, including recommendations for regular vaccinations and ongoing surveillance.

**March 2023:** The COVID-19 vaccination is added to the schedule of routine immunizations for eligible age groups.

**April 2023:** Health Canada reviews the latest global COVID-19 data and advises on any necessary updates to national guidelines and policies.

**May 2023:** Schools and universities prepare for a new academic year with COVID-19 safety measures adapted to the current situation.

**May 4, 2023:** The WHO Director General announces that COVID-19 is now an established and ongoing health issue and no longer constitutes a Public Health Emergency of International Concern (PHEIC).

**June 2023:** The federal government reviews its international travel advisories related to COVID-19.

**July 2023:** Health Canada monitors for new variants of the virus and assesses the need for vaccine adjustments.

**August 2023:** Back-to-school plans are executed with updated COVID-19 protocols based on the latest public health advice.

In a future timeline, it would be expected that ongoing surveillance, continuous vaccination efforts, and a focus on managing COVID-19 as an endemic disease would be major themes. This “speculative” timeline is based on the assumption of continued progress in managing the pandemic. Real events could deviate significantly depending on various factors, including scientific advancements, viral evolution, and policy decisions.
2.3. Aftermath of Pandemic (2023)

The terrible aftermath of the COVID-19 pandemic was not due to the virus itself. Rather the terrible effects throughout Canada were the result of the interventions implemented by the various levels of government.

The aftermath of the interventions implemented by all levels of government during the COVID-19 pandemic is multifaceted and continues to unfold.

Every single person alive in Canada now and for generations to come has and will be impacted by the scope and magnitude of the interventions put in place by all levels of government in Canada.

The fundamental fabric of Canadian society was and continues to be shredded by the unnecessary measures that were implemented by all levels of government across Canada. These measures destroyed Canadians’ trust in themselves, their families, their communities, trust in institutions, and trust in democratic tenets including the rule of law.

Public institutions which exist to protect citizens failed to do so.

Untold thousands of people died: some due to severe adverse reactions to a coerced experimental gene therapy; others died due to despair, loneliness, addictions, or violence which were exacerbated by the measures imposed by governments.

Billions if not trillions of dollars were lost from the economy as a direct and indirect result of the actions of the government. The national debt is at a historic high. Quiet quitting has become a phenomenon. Unemployment, bankruptcy, and insolvency rates reached a peak during the lockdowns, and these increased rates persist to this time.

While the full impact of government mandates and measures have yet to be fully understood, here are some key repercussions that have emerged in the aftermath.

The interventions imposed by the government during the pandemic have allegedly caused significant loss of life with thousands of people succumbing to the strains placed on society by either the imposed directives or directly from adverse reactions to the experimental vaccines.

The long-term health effects for survivors, including potential complications and lingering symptoms, are still being researched.

Health systems are faced with the task of addressing the backlog of delayed medical treatments and prioritizing ongoing healthcare needs.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The interventions imposed by governments during the pandemic has had profound economic consequences. Many businesses have closed, and sectors such as tourism, hospitality, and retail have been particularly affected. Unemployment rates have risen and global poverty levels have increased. Governments have implemented various economic stimulus measures to support individuals, businesses, and economies. The full extent of the long-term economic impact is yet to be determined.

The interventions imposed by governments during the pandemic disrupted education systems. Schools and universities switched to remote learning, which was ineffective in terms of access, quality, and student engagement. The digital divide and learning inequalities were highlighted during this period. The long-term effects on students’ educational attainment and skills development are areas of concern.

The interventions imposed by governments during the pandemic have taken a toll on mental health and wellbeing. Social isolation, fear, grief, and economic stress have contributed to increased levels of anxiety, depression, and other mental health conditions. Access to mental health services and support has become crucial in the aftermath of the pandemic.

The interventions imposed by governments during the pandemic have exacerbated existing social and economic inequalities. Vulnerable populations, including low-income communities, marginalized groups, and those without access to adequate healthcare, have been disproportionately affected. Addressing these disparities and ensuring equitable recovery is a significant challenge in the aftermath.

The interventions imposed by governments during the pandemic have underscored the importance of robust healthcare systems, emergency preparedness, and global cooperation. Canada must invest in strengthening the public health infrastructure, pandemic response capabilities, and surveillance systems to better respond to future health crises.

The obvious conflict in legislation between Public Health Emergency Planning and Response and the Emergency Measures organizations must be addressed. Much of the damage done during the emergency response was that public health officials were not qualified to undertake the planning and implementation of an emergency response. The people who were qualified and trained to do this were sidelined and the result was devastating. Public Health can never again be tasked with undertaking an emergency response. This responsibility must lie with Emergency Measures organizations to which Public Health will provide technical expertise and support.
The global response to the pandemic has highlighted the gross inadequacy and capability of any global organization to direct a public emergency response that must take the needs of particular regions and populations into account. The blind following of orders sent down from a bureaucratic and political organization is directly in conflict with the very successful and long held practise of addressing emergency situations from a ground-up perspective. Federal governments should only serve to provide communications and resources when requested. They should never be entrusted with the actual direction and implementation of emergency plans and actions for Canada, a nation state.

It is important to note that the aftermath of the interventions and provincial dictates imposed by the government during the COVID-19 pandemic varied across regions of the country, depending on factors such as extent and scope of the local interventions, healthcare systems, socioeconomic conditions, and vaccination coverage.

The recovery and rebuilding process will require sustained efforts and adaptation to address the long-term impacts of the interventions imposed by the government during the pandemic on various aspects of society.
3. National Citizens Inquiry

3.1. Public Confidence in Government-Led Public Inquiries

Introduction

Government-led public inquiries can play a crucial role in investigating significant events and emerging issues of public concern. Formally known as Royal Commissions, these types of inquiries have been around for some time.

Historically, the intent of government-led inquiries was to uncover the truth, hold individuals accountable, and to inform public policy. The confidence of the public in the integrity and effectiveness of these inquiries is vital for national success.

More recently, Canadians began questioning the validity of government inquiries. This stems from the reluctance of governments to listen to issues of public concern in a fair and unbiased manner. Instead, it is widely believed that many public inquiries are simply for show, utilized to satisfy certain legislative requirements. This may explain why Canadians have become disillusioned by governments carefully choreographing the agenda to reach a predetermined and government beneficial conclusion.

Often these inquiries are staffed with government insiders and/or people invited to participate, even though in some circumstances there exists the appearance of conflicts of interest. The latter in and of itself provides Canadians with legitimate reasons not to trust their public institutions.

Further, without the presence of an objective and unbiased media, the perception is that these public inquiries are generally used to smooth over government failures, indiscretions, conflicts of interest, and outright wrong-doing.

Therefore, government-led public inquiries are often seen as susceptible to bias or political interference, particularly when these inquiries are initiated or overseen by more superior governing authorities. Skepticism arises if there are concerns that the inquiry’s findings and recommendations may be influenced or manipulated to protect certain interests or, conversely, to avoid political or legal consequences.

Most of all, government-led public inquiries are expected to be independent and free from external influence. However, when doubts of impartiality arise, inevitably public trust erodes. The same complaint can be linked to transparency. People expect their voices to be heard.

If there are doubts about the impartiality and independence of the commissioners or panel members leading the inquiry, public trust will be eroded. Perceptions of conflicts of interest or close ties to the entities being investigated can also undermine confidence in the inquiry process.
Stated differently, this provides reasons why government-led public inquiries face criticism, particularly if the scope or terms of reference are perceived as too narrow or limited. By the same token, if the inquiry fails to address all relevant aspects of an issue or excludes certain key stakeholders, the public may question the thoroughness and fairness of the investigation.

It is from these perspectives, and more, that public trust diminishes when there is a perception that the findings and recommendations of the inquiry are not adequately acted upon or implemented. If there is a lack of accountability for those responsible for the issues under investigation, it can reinforce the perception that the inquiry was a superficial exercise without meaningful consequences.

Extended inquiry processes with frequent delays can undermine public trust. If an inquiry drags on for an excessive amount of time without clear progress, it may be viewed as an attempt to prolong or avoid uncomfortable findings. Lengthy processes can also lead to public fatigue and a diminished sense of the inquiry’s importance or relevance.

In recent years, government-mandated inquiries have not effectively addressed the concerns of citizens, leading to increased skepticism and diminished confidence in the effectiveness and impact of future inquiries.

Public apathy is also a problem since there is a perception that even a negative ruling against the government will simply go unaddressed. It is not enough for a responsible party to simply make an apology in public for unethical or illegal behaviour. Business as usual cannot be the result.

In recent times, both federal and provincial governments have failed to address many of these factors. Governments have been ineffective in restoring public confidence. Governments have also failed to demonstrate the importance of truth-seeking, accountability, and effectively informing public policy decisions.

Given the current level of public mistrust in government-led public inquiries, it is essential to address these concerns by ensuring transparency, independence, inclusivity, effective communication, and timely implementation of recommendations through a completely independent and citizen-led inquiry.

Should government decide to restore public confidence, it will involve a long process of action rather than propaganda. However, if it is the desire of the Canadian people to restore the accountability of their government, they must insist on the following five foundational requirements for any future government-led public inquiry:

**Transparency**

Transparency is a cornerstone of public confidence in government-led public inquiries. The process should be open, accessible, and free from hidden agendas or opaque-led decision-making. Transparency ensures that the public has a clear understanding of the inquiry’s objectives, procedures, and findings. Timely release of information, public access to hearings or proceedings,
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

and the publication of inquiry reports are essential components of transparency. When the public can see that an inquiry is conducted in a transparent manner, it enhances their trust in the process and its outcomes.

Independence
Independence is another critical factor in fostering public confidence in government-led public inquiries. An inquiry must be perceived as free from undue influence or interference. Independent commissioners or panel members, appointed through a transparent and accountable process, help establish this perception. It is important that those leading the inquiry have the necessary expertise and impartiality to investigate the matter at hand. Independence ensures that the inquiry’s findings and recommendations are not compromised by political or external pressures, which strengthens public trust in the process.

Inclusivity
Inclusivity is key to instilling confidence in government-led public inquiries. The involvement of affected individuals, communities, experts, and relevant stakeholders in the inquiry process is essential. Inclusive participation allows diverse perspectives to be heard, fosters public trust, and ensures the inquiry’s conclusions are comprehensive and well-rounded. Engaging with those affected by the issues under investigation demonstrates a commitment to fairness, empathy, and transparency, further enhancing public confidence in the inquiry.

Effective Communication
Effective communication is crucial in maintaining public confidence in government-led public inquiries. Clear and regular communication about the inquiry’s progress, objectives, and key milestones helps the public stay informed and engaged. This includes providing updates on the inquiry’s findings, explaining the rationale behind decisions, and addressing any concerns or questions from the public. Open and transparent communication builds credibility and demonstrates the inquiry’s commitment to serving the public interest.

Implementation of Recommendations
The implementation of recommendations arising from a government-led public inquiry is essential to maintaining public confidence. When the findings and recommendations of an inquiry are promptly and effectively acted upon, it demonstrates that the inquiry was not merely a symbolic exercise but an opportunity for meaningful change. Government commitment to implementing the recommendations sends a strong signal to the public that the inquiry had a real impact and that the government is responsive to the concerns identified during the inquiry process.

Conclusion
Public confidence in government-led public inquiries is crucial for the legitimacy, effectiveness, and impact. Transparency, independence, inclusivity, effective communication, and the implementation of recommendations are key elements that contribute to building and sustaining public confidence. When these factors are prioritized, the public can trust that government-led public inquiries are conducted in an impartial, fair, and accountable manner. Public confidence ensures that the
inquiries serve their intended purpose, which is to uncover the truth, hold accountable those responsible, and inform policies and actions to prevent similar issues in the future.
3.2. The Need for an Independent Inquiry

An independent inquiry was necessary for a variety of reasons, including the following:

The Canadian public no longer has confidence in the government conducting objective and impartial investigations into significant events or issues. By removing potential biases and conflicts of interest, independent inquiries can provide a fair assessment of the facts and circumstances surrounding potentially contentious public matters.

Only a truly independent inquiry could build public trust and confidence in the investigation process. When an inquiry is perceived as unbiased and free from external influence, the public is more likely to have confidence in its findings and recommendations.

An independent inquiry that directly engages the public in locations across Canada is vital in holding individuals, organizations, or institutions accountable for their actions or decisions. By examining evidence, interviewing witnesses, and assessing relevant information, independent inquiries can determine responsibility and ensure transparency in the process.

This independent Inquiry has the capacity to identify systemic issues or underlying factors that contribute to significant events or issues. By delving into the root causes, an independent inquiry can provide valuable insights and recommendations to prevent similar incidents from occurring in the future.

Through their findings and recommendations, the National Citizens Inquiry has highlighted areas of improvement to guide the development of effective policies, procedures, and regulations.

The National Citizens Inquiry hearings served as a mechanism for the public to voice their concerns and restore confidence in institutions or systems that may have been compromised. By conducting a thorough and independent examination of an issue, an inquiry can help restore public trust and demonstrate accountability.

The National Citizens Inquiry promotes transparency and upholds democratic values by ensuring that government actions or decisions are subject to scrutiny. They contribute to a transparent and accountable governance system, fostering public participation and ensuring that decisions are made in the best interest of society.

Overall, the National Citizens Inquiry was necessary to ensure fairness, accountability, and transparency in investigating significant events or issues. By removing biases and conflicts of interest, independent inquiries play a crucial role in delivering objective findings, promoting public trust, and informing policies to prevent recurrence.
4. Objectives of Inquiry

4.1. Overall Objects of an Independent Public Inquiry

The overall objectives of an independent public inquiry on the COVID-19 response included:

Examing the Effectiveness of the Response: The National Citizens Inquiry aimed to assess the effectiveness of government responses to the COVID-19 pandemic. This included evaluating the actions taken, policies implemented, and decisions made by authorities at various levels.

Identifying Strengths and Weaknesses: The National Citizens Inquiry sought to identify the strengths and weaknesses in the COVID-19 response, including areas where the response was successful and where improvements could have been made. It aimed to provide an impartial assessment of the actions taken and identify lessons learned for future preparedness and response efforts.

Assessing Decision-Making Processes: The National Citizens Inquiry examined the decision-making processes used by government bodies and public health officials during the pandemic. This involved evaluating the quality and timeliness of decisions, considering the available evidence and expert advice, and assessing the communication of those decisions to the public.

Examining the Impact on Public Health: The National Citizens Inquiry assessed the impact of the COVID-19 response on public health outcomes, including the effectiveness of measures such as testing, contact tracing, quarantine protocols, vaccination strategies, and healthcare system preparedness. It evaluates the extent to which the response protected public health, reduced the spread of the virus, and mitigated the impact on vulnerable populations.

Evaluating Communication and Transparency: The National Citizens Inquiry examined the communication strategies employed by authorities to disseminate information about the pandemic, public health measures, and risks. It assessed the transparency of data sharing, public messaging, and the dissemination of accurate and timely information to the public, media, and stakeholders.

Holding Accountable and Restoring Trust: The National Citizens Inquiry sought to establish accountability for any failures or shortcomings in the COVID-19 response. The National Citizens Inquiry has identified any instances of misconduct, negligence, or lack of adherence to established protocols. The objective is to restore public trust in government institutions and ensure that responsible parties are held accountable for their actions or decisions.

Recommending Improvements: Based on the findings and analysis, the National Citizens Inquiry aimed to provide recommendations for improving future pandemic preparedness and response efforts. This has included recommendations for changes in policies, procedures, legislation, and governance structures to enhance public health resilience and response capabilities.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The overall objective of the National Citizens Inquiry on the COVID-19 response is to provide a comprehensive, impartial, and evidence-based assessment of government actions and decision-making processes. It serves to inform policy development, identify areas for improvement, restore public confidence, and contribute to better preparedness and response efforts in future public health crises.
4.2. The National Citizens Inquiry

More specifically, in addition to the general objectives stated previously, the National Citizens Inquiry undertook the following specific actions:

1. To inquire into and undertake dialogue with Canadians. To listen to Canadians concerning the impacts of government health and public policy measures impacting their personal lives, including their physical and mental health, families, and communities (particularly children and seniors), jobs and livelihoods, businesses, and their fundamental freedoms and civil liberties as guaranteed by the Constitution.

2. To invite Canadians to pose to the Inquiry any unanswered or unclear questions concerning COVID-19 and governments’ responses thereto, and for the Inquiry to make all reasonable efforts to secure answers to those questions.

3. To receive and evaluate testimony from medical, legal, scientific, and other relevant experts concerning government pandemic measures and strategy, what information was known or knowable by governments, and what alternative approaches could have been taken.

4. To receive and evaluate testimony from mainstream and independent media in order to understand what information was known or knowable and why information was conveyed to the public as it was.

5. To invite input from healthcare officers and other governmental officials as to the rationale behind the healthcare protection measures adopted—including mandates, lockdowns, and similar orders and actions—and the strategies employed to secure public compliance.

6. To invite and secure testimony as to the appropriateness, efficacy, legality, and constitutionality of government responses to COVID-19.

7. To investigate public sector expenditures, grants, and any other subsidies or financial support programs and their distribution related to the governmental responses to COVID-19.

8. To consider the issue of civic and criminal liability for any damages or harms caused by government responses to COVID-19.

9. To make publicly available to Canadians all findings, submissions, and testimonies certified by and formally presented through the Inquiry.

10. To identify any mistakes, negative impacts, or mismanagement that the Inquiry may determine to have occurred and, if it does so, to recommend appropriate measures for more appropriate and effective government responses in the future.
4.3. The Commissioners

4.3.1. Role of the Commissioners

The NCI’s Commission consisted of four independent Commissioners. The Commissioners then selected, through a vote, a Chair to lead the Commission.

Commissioners were solely responsible for hearing testimony and issuing their report and recommendations.

The Commissioners were identified by Canadians and reviewed and appointed by the Support Group on the basis of their credibility, demonstrated objectivity, and competence in one or more relevant areas (for example, law, medicine, ethics, public policy, journalism, etc.). It was essential that potential Commissioners be individuals that had not publicly expressed strong views, in any way, regarding governments’ COVID-19 policies.

Commissioners were supported by a Secretariat staff comprised of lawyers and other professionals.

Upon the conclusion of the hearings, the Commissioners issued this public report, including recommendations.

4.3.2. Independent Commissioners

A key aspect of the Inquiry was that the Commissioners were independent of the Commission, governments, or any other outside influence.

Independence ensured that Commissioners were free from any external influence or bias, enabling them to approach the Inquiry with impartiality. They were not beholden to any specific interests or stakeholders, allowing them to objectively examine the evidence and make unbiased conclusions. This enhanced public trust in the process and the outcome of the Inquiry.

Independence lent credibility and legitimacy to the findings and recommendations of the National Citizens Inquiry. When Commissioners are perceived as independent, their conclusions are more likely to be accepted and respected by the public, government entities, and other policy stakeholders. This increases the chances of effective implementation of the Inquiry’s recommendations and fosters public confidence in the fairness of the process.

This Inquiry involved sensitive and controversial matters that could impact various participants, including powerful individuals or organizations. By ensuring the independence of Commissioners, potential conflicts of interest could be minimized or eliminated. Commissioners could make decisions and recommendations solely based on the evidence and the best interests of the public, without fear of reprisal or undue influence.
Independence in a public inquiry promotes transparency and accountability. It ensures that the inquiry process is conducted in an open and accountable manner, free from interference or coercion.
4.3.3. Selection of Commissioners

The Inquiry’s Commissioners were selected for objectivity, independence, and competence. Commissioner Ken Drysdale was selected the Chair, and he provided direction to the Commission Administrator, the Honourable Chelsey Crosbie.

The Commissioners had the power to direct the Inquiry, to decide any procedural or substantive question that arose, and to produce interim or final reports and recommendations.

It was critical that selected Commissioners were, and are seen to be, credible in all regards and in particular that they were, and are seen to be, as objective, competent, and trustworthy to Canadians on whose behalf the Inquiry was being conducted.

Given the broad scope of the Inquiry, efforts were made to select Commissioners from various locations across Canada and to include Commissioners who had a broad range of expertise.

Suggestions were received from the public and were evaluated, and those most qualified to serve were contacted and invited to a series of interviews with selected members of the Steering Committee.

Following that interview process each Commissioner was vetted for perceived conflicts of interest.

Commissioners signed a Declaration of Understanding and Neutrality indicating that they accepted the Inquiry’s Terms of Reference and were committed to conclusions and recommendations based solely on witness testimony provided to the Inquiry.

The names and biographies of the selected Commissioners have been posted on the Inquiry’s website. Short summaries follow.
4.3.4. The Commissioners

Following are brief descriptions of the independent Commissioners:

**Ken Drysdale, Chairperson**, is an executive engineer with over 40 years of experience as a Professional Engineer, which includes 29 years experience in the development and management of national and regional engineering businesses.

He was the founder and president of a multidisciplinary engineering company with unique expertise in arctic development. He is currently president of an artisan steel fabrication firm and senior partner in an Audio and Video production company.

Ken is currently retired from full-time practice as a consulting engineer but continues to be active in the area of forensic engineering, investigations, preparation of expert reports, and expert testimony at trial, arbitrations, and mediations.

He has testified as expert witness at trials in Manitoba and Ontario. He has acted as the arbitrator and mediator in disputes.

**Bernard Massie, PhD**, graduated in microbiology and immunology from the University of Montreal, in 1982, and completed a three-year postdoctoral fellowship at McGill University studying DNA tumour viruses. He worked at the National Research Council of Canada (NRC) from 1985 to 2019 as a biotechnology researcher and held various management positions, including the position of Acting Director General of the Human Health Therapeutics Research Centre from 2016 to 2019. He has devoted a significant part of his career to the development of integrated bioprocesses for the industrial production of therapeutic antibodies and adenovirus vaccines. He was also an associate professor in the department of microbiology and immunology at the University of Montreal from 1998 to 2019. He is currently an independent consultant in biotechnology.
Janice Kaikkonen’s passion is community outreach. She works primarily with vulnerable populations and youth. Academically, she holds degrees in Island Studies (MA), English and Political Science (BA), and Public Administration. Janice has taught in both K-12 and post-secondary education (Faculty of Arts, Education, Journalism, and preMed). Her research specialization involves the intersection of public policy and the social fabric, which has led Janice to pursue a PhD in Theology and Discipleship.

Professionally, Janice served as a researcher on the PEI Task Force for Student Achievement, as Coordinator for Canadian Blood Services, and was a contributing member to the Canadian Supply Chain Sector Council. At one point, Janice established a transportation service for adults with special needs and owned/operated a summer day camp for youth. In her spare time, Janice enjoys reading and writing and leading workshops on effective communications and media.

Currently, Janice serves as an elected trustee for Bluewater District School Board. Married to Reima, they have 7 children and 17 grandchildren. They live on a farm in Southgate, Ontario.

Heather DiGregorio is a senior law partner at a regional law firm located in Calgary, Alberta. Heather has nearly 20 years of experience in the areas of tax planning and dispute resolution, which involves assisting her clients to navigate the complex and ever-evolving Canadian tax landscape. She is a past executive member of the Canadian Bar Association (Taxation Specialists) and of the Canadian Petroleum Tax Society. She continues to be a frequent speaker and presenter at these organizations, as well as at the Canadian Tax Foundation and the Tax Executives Institute. Repeatedly recognized within the legal community as an expert and leading lawyer, Heather has represented clients at all levels of Court, including the Alberta Court of King’s Bench, the Tax Court of Canada, the Federal Court of Appeal, and the Supreme Court of Canada.
4.4. The Report

The report of the Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada was authored by the four independent Commissioners with the support of the various resources allocated to the Commission and as outlined in Section 5 of this document.

During the preparation of the National Citizens Inquiry report, there were several key considerations at the forefront of the Commissioners’ minds. These considerations helped to ensure that the Report would be comprehensive, objective, and effective in addressing the purpose of the Inquiry.

Here are some important factors that were considered:

Understand the specific terms of reference that defined the scope and purpose of the Inquiry, and stay within those boundaries while conducting investigations and writing the report.

Maintain independence and impartiality throughout the inquiry process. Avoid conflicts of interest or biases that may compromise the integrity of the Report.

Use robust methodologies to collect and analyze evidence. Ensure that evidence was reliable, verifiable, and relevant to the Inquiry’s objectives. Clearly explain the methods used and the limitations of the evidence.

Present the findings of the Inquiry in a clear and concise manner. Use plain language to ensure the Report is accessible to a wide audience. Provide context and explanations where necessary to aid understanding.

Make practical and actionable recommendations based on the findings. Clearly outline the rationale behind each recommendation and explain how they address the issues identified. Consider the feasibility and potential impact of the recommendations.

Maintain transparency in the inquiry process by documenting and disclosing all relevant information. Be accountable for the findings and recommendations by providing a robust justification for each.

Engage with relevant stakeholders throughout the inquiry process. Seek input, gather diverse perspectives, and ensure that the report would reflect a broad range of voices and experiences.

Complete the report in a reasonable timeframe. Delivering the report promptly helps maintain public confidence and ensures that recommendations are implemented in a timely manner.

Present the report in an accessible format, considering different audiences and their varying levels of expertise. Use headings, summaries, and visual aids to aid comprehension.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Consider the steps required for the implementation of recommendations and outline a plan for monitoring and evaluating progress. Ensure there are mechanisms in place to track the impact of the Inquiry’s findings and recommendations.
5. Procedures

5.1. Introduction

The National Citizens Inquiry was a citizen-led and citizen-funded initiative that was completely independent from government and operated without legal compulsion or coercion. Legally, it is organized as a non-profit corporation with a Board of Directors to manage financial and compliance issues; however, the Inquiry was led by a Support Group and Commissioners.

The conduct of the Public Hearings and the Rules as set out in the Commission Rules Document were informed by the following Procedural Principles:

• Proportionality: The Inquiry would allocate investigative and hearing time in proportion to the importance and relevance of the issue to the Inquiry’s mandate and the time available to fulfill that mandate so as to ensure that all relevant issues would be fully addressed and reported on;

• Transparency: The Inquiry proceedings and processes must be as open and available to the public as is reasonably possible, consistent with the requirements of national security and other applicable confidentialities and privileges;

• Fairness: The Inquiry must balance the interests of the public to be informed with the rights of those involved to be treated fairly;

• Timeliness: The Inquiry must proceed in a timely fashion to engender public confidence and ensure that its work remain relevant; and

• Expedition: The Inquiry must operate under a strict deadline and conducted its work accordingly.

Parties and their legal representatives, as well as those otherwise taking part in the Public Hearings, conducted themselves and discharged their responsibilities under the Rules, in accordance with the Procedural Principles.
5.2. The National Citizens Inquiry Organization

5.2.1. The Commissioners

The NCI’s Commission consisted of up to four Commissioners. These Commissioners selected a Chairperson to lead the Commission.

- To select Commissioners, the NCI invited the public to nominate individuals the public had confidence could perform the role of Independent Commissioner. Applications were vetted by a volunteer committee, which then submitted a short list to the Support Group. The Support Group appointed the individuals they believed were best suited to conduct the Inquiry in a fair and impartial manner. The Commissioners appointed were Ken Drysdale, Bernard Massie, Janice Kaikkonen, and Heather DiGregorio.

- As set out in the Commission Rules, the Commissioners were independent of the NCI Administration. The Commissioners had authority over hearing the testimony and the conduct of the hearings. The NCI had the administrative role of supporting the Commissioners by performing the administrative tasks necessary to organize the hearings.

- The Commissioners were charged with drafting and issuing a public report including recommendations, if any.

- The NCI was responsible for presenting the report and recommendations to the public and to governments so that if Canada faces a future pandemic, the lessons identified by the Inquiry can be used to ensure that the best decisions are made in the future.
5.2.2. Support Group

The NCI was, and continues to consist of, two main components, the Commissioners and the Support Group.

• The Support Group is a purely administrative committee that facilitates the NCI’s logistics, such as booking venues, maintaining the NCI website, or raising funds to support the initiative. The Support Group drafted the initial Terms of Reference for the Inquiry. The Support Group had no role in the substantive aspect of the Inquiry (for example, asking questions of witnesses, considering evidence, or advising the Commissioners).

• The Support Group is represented across Canada through Regional Subcommittees. These committees carry out the local planning and organization needed to host the NCI hearings, accommodate witnesses, and provide logistical support to the Commissioners.

• Support Group and Regional Subcommittee members are all unpaid volunteers who have stepped forward from across Canada and all walks of life.
5.2.3. Funding

The NCI was and is strictly funded by donations from Canadian citizens. The NCI does not have a single large donor.

While preparing for and running the hearings, the NCI did not have enough funds to pay for the next hearing. At each hearing, the NCI asked the public to donate so that the hearings could continue. The public responded and hearing-by-hearing enough funds came in to allow the Inquiry to continue. At the beginning, most of the donations were small, such as $25 or $50. As the Inquiry continued, the average size of the individual donations increased.

The fact that large numbers of individual Canadians across the country made the Inquiry happen by individual donations demonstrates the nation-wide desire of Canadians for an inquiry that listened to the citizens.
5.2.4. Volunteer Nature of the NCI

The Support Group, which began and managed the NCI, was and is made up strictly of volunteers. As the NCI progressed, it had a maximum of three support staff to assist with the administration, website, and social media. For some specific tasks, contractors were hired for limited durations.

The Audio Visual team that travelled with the NCI was under contract but went above and beyond what they had been asked to do. All of the support staff and teams also volunteered by working well beyond the hours they were paid for and the tasks they were originally asked to perform.

All substantive activities of the NCI were performed by volunteers including:

- setting the goals of the NCI and organizing its structure,
- running the NCI administration with the staff,
- vetting and selecting Commissioners,
- setting communications strategies and messaging,
- vetting and preparing witnesses,
- preparing for and running the hearings,
- fundraising,
- media appearances and witness videos,
- social media teams clipping videos of testimony,
- calling witnesses at the hearing,
- preparing transcripts of witness testimony,
- website preparation, and
- preparing for the release and communication of the Commissioners’ Report.

This is by no means an exhaustive list.

There is no accurate count of the number of volunteers that participated in the NCI. In part, this is because some volunteer groups, once set up, added to their number as they performed their tasks. Shawn Buckley, who participated in setting up many of the volunteer groups, estimated that there were between 800 and 1000 volunteers.
In addition to volunteer activities managed by the NCI team, countless Canadians decided to undertake their own efforts to promote and support the NCI. Whether it was the Posties for Freedom holding posters at City Hall, or individuals retweeting NCI hearings and events, the public participation changed the NCI.

The NCI became such a citizen-led and -run adventure that the NCI Support Group and administration were and are not even vaguely aware of all that volunteers have done on their own.
5.3. The Investigative Process

5.3.1. Structuring the Investigations

The Inquiry had many objectives, including hearing from Canadians about the impacts of government health and policy measures on all aspects of their personal lives, to invite and secure testimony as to the appropriateness, efficacy, legality, and constitutionality of government responses to COVID-19.

Never before had there been a citizen-run public inquiry. New Rules had to be prepared which ensured the Commissioners were independent and that a fair structure was established to ensure all voices were heard. An outside lawyer was hired to prepare an initial set of Rules. Volunteer lawyer Shawn Buckley and Inquiry Administrator the Honourable Chesley Crosbie then adapted these Rules to work with the NCI structure.

The Inquiry commenced with a preliminary investigation by the Inquiry Administrator. The goal of the investigation was, in part, to identify the core or background facts and to identify witnesses.

The investigation consisted primarily of document review, engagement with interested persons, and interviews by Inquiry Administrator and staff, including volunteers.
5.3.2. Organization of Public Hearings

The Inquiry Rules permitted the holding of public hearings as follows:

- 51. Public Hearings will be convened anywhere in Canada as the Support Group may determine to address issues related to the Inquiry. Hearings may proceed virtually or in hybrid form.

- 52. The Support Group will, in consultation with the Commissioners, set the dates, hours and place of the Public Hearings.

With agreement of the Commissioners, the Support Group determined a series of in-person hearings were to be held across Canada. It was agreed that these cross-country hearings would be appropriate to achieve the Inquiry’s objectives, given the Inquiry was committed to “hearing evidence in a process that is public to the greatest extent possible” (per Inquiry Rule 58).

Three-day hearings were planned and scheduled in 2023 in the following locations:

- Truro (representing NL, NS, PEI, NB): March 16 to 18, 2023,
- Toronto (representing Ontario): March 30 to April 1, 2023,
- Winnipeg (representing Manitoba): April 13 to 15, 2023,
- Saskatoon (representing Saskatchewan): April 20 to 22, 2023,
- Red Deer (representing Alberta): April 26 to 28, 2023,
- Vancouver (representing British Columbia and the Territories): May 2 to 4, 2023,
- Québec City (representing Québec): May 11 to 13, 2023, and

All hearings were conducted in English, except the Québec City hearings, which were conducted in French. (All hearings would have been fully bilingual had the funding permitted this.) Members of the public were invited to attend the hearings in-person, and they were also live streamed so anyone interested could hear the testimony.

Hearings were scheduled from 9 a.m. to 5 p.m. local time each day, but often ran later into the evenings.

The Inquiry Administrator (or his representative) served as Chair of each hearing; Commission Counsel called each witness at the hearing.

Regional organizing committees were established for each hearing to assist with local arrangements.
5.3.3. Identification and Vetting of Witnesses

NCI established an online application process that invited Canadians to offer to testify at one of the hearings. Given the reasons for the Inquiry as outlined in its Terms of Reference, testimony was sought to address four main categories of impacts from governments’ health-protection and policy measures.

CIVIL

- Legal, policing, policy, regulatory, human rights, emergency preparedness, government, private-public partnerships, anti-trust, monopolies, private corporations

SOCIAL

- Media, family, faith, education, community, service delivery, societal coercion

ECONOMIC

- Impacts related to financial matters at all levels, personal, family, corporate and governmental expenditures and debt, government actions

HEALTH

- Medicine, research, pharmaceuticals, regulatory, safety monitoring, patient relations, doctor-patient relationship, industry health, messaging, incentives, and regulatory collusion

In addition, the Inquiry sought testimony concerning “alternative medical narratives,” that is, medical or health information that differed from that presented by governments or the media.

To ensure witness testimony covered a range of desired topics across these categories, a detailed series of questions was developed, and witnesses were evaluated on who could offer testimony that could answer questions in these four subject areas.

The open, online application process invited testimony from lay witnesses (those who testified about the impacts of governments’ COVID measures on themselves or their families) and expert witnesses (those whose testimony represented their expert opinion). Witnesses had the option of testifying in-person or virtually. The Inquiry received many more applications to testify than could be included in the eight hearings.
General Procedures
All witness applicants were reviewed by a Selection Committee established for this purpose. The Regional Organizing Committees were involved in selecting lay witnesses for their hearings, so the testimony at each hearing reflected regional differences in how citizens were affected by the health-protection measures across Canada.

Expert witnesses were selected by the Selection Committee in consultation with the Regional Committees to apportion a similar number of witnesses to testify at each hearing and ensure their testimony covered the full range of topic areas over the course of the entire Inquiry.

After a short-list of witnesses was selected for each hearing, members of the Inquiry’s legal team prepared the witnesses to testify. Some witnesses were screened out by the legal teams if they felt the individual testimony would not fit the categories selected for the hearings.

Given the Regional Committees were actively involved in the witness selection process, there were slight variations in the vetting process in each location.

Witness Drop-Out
Shortly after the NCI invited witnesses to apply on the NCI website to be considered as witnesses, the NCI was flooded with applications. It became clear that only a handful of those who applied could be selected to testify. Those who were selected to testify were contacted or interviewed multiple times. The last point of contact was made by the lawyer who called the individual as a witness.

Despite all of this prior contact, a number of witnesses dropped out a few days before their scheduled testimony time or on the day of testimony. Various reasons were given such as concern of discrimination in employment or concern of social pressure from family or friends. Some became too sick to testify. Some became too anxious to testify.

A couple of expert witnesses also dropped out.
**Public Lay Witnesses**

A public lay witness or “Non-Expert” witness was an individual who believed they had been harmed directly or indirectly by any of the COVID-19 measures. You may consult the NCI’s website to learn more about the kinds of personal harms Canadians have already identified.

Examples included:

- Disruption in the lives/education of children/students,
- Impaired mental health due to isolation,
- Business loss due to restrictions,
- Job loss due to vaccination mandates,
- Delayed or denied healthcare for non-COVID-19 matters,
- Adverse reaction(s) to COVID-19 genetic vaccines,
- Reputation and/or professional discipline or censorship for expressing contrarian views,
- Restrictions of fundamental liberties, such as speech, association, or travel.

The NCI contacted witnesses whose applications were selected to continue in the screening process. Discussions were held with selected applicants to arrange their participation at the most appropriate hearing location and time. Selected applicants were provided with NCI’s guidelines to assist them in preparing for their testimony.

Witnesses were advised that

- they would only be able to testify under oath.
- they may be subject to vigorous questioning, and
- their testimony would be subject to strict time limits.

Applicants who were not initially selected to testify may still have their story published on the NCI website at a later date as part of a broader project to give a voice to as many Canadians as possible. NCI strived to publish as many stories as possible. NCI contacted every applicant to receive their consent and also, potentially, to ask more questions.
A team of volunteer medical doctors screened all witnesses that testified about vaccine injury. This team developed a medical questionnaire to ensure that each vaccine-injury witness was speaking about injuries that were reasonable to ascribe to the vaccine. For example, underlying conditions which could cause similar injuries were investigated. Each vaccine-injury witness was then interviewed by one of the volunteer doctors to go through the questionnaire. This was to ensure that only witnesses whose injuries could be credibly attributed to the vaccine were approved to provide testimony to the Inquiry.
Public Expert Witnesses
“Expert” witnesses were individuals who gave testimony based on their professional and academic expertise and experience in one or more specific fields relevant to the COVID-19 measures.

Examples included

- doctors and scientists (for example, epidemiologist, pathologist),
- lawyers and public servants,
- economists and professors,
- journalists, and
- psychologists.

“Expert” witness applications were assessed against the following criteria:

- experience and credentials,
- topic(s) of testimony,
- objectivity, and
- strength of supporting evidence.

Government Witnesses
The NCI received no offers to testify from government witnesses (unless the individuals had left government or retired). Under the Inquiry’s Rules, such witnesses could be issued a Summons to attend a hearing to provide testimony on a matter requested by the Commission Administrator.

Sixty-three Summons letters were issued to federal, provincial, and territorial government officials from across Canada. None of the subpoenaed officials agreed to attend any of the hearings to provide their testimony.

Unlike a government commission, the NCI had no legal authority to compel a witness to testify. The Summonses that were served on government witnesses were non-binding in that it was clear that there was no criminal or civil liability for failing to attend.

Although government witnesses were served with a Summons to attend at a specific location at a specific time, the Summons also made it clear that the witness could attend at a different hearing date, in-person or virtually. This was done so that if a witness had a busy schedule it was made clear to them the NCI would accommodate them so that they could testify.
5.3.4. Recording and Archiving of Witness Testimony

All eight hearings were recorded in their entirety. Recordings of each day and individual recordings of each witness will be permanently archived and available for viewing on the NCI website. English and French transcripts of the testimony from each hearing will also be permanently archived and available on the NCI website.
5.3.5. Collecting Documents

An exhibit ledger was developed for materials entered as testimony by witnesses at the hearings. Witness materials included Powerpoint presentations, reports, curriculum vitae, photos, and media reports.

All exhibit materials were identified with a unique number and classified by Commission Counsel as public or in-camera (i.e., confidential). All exhibits were listed on the Inquiry website, and all public items were posted as well. (In-camera items are available for viewing by the Commissioners only.) The exhibit ledger will be permanently archived for ongoing reference on the NCI website.
5.3.6. Commissioners’ Evaluation of Evidence and Report

The National Citizens Inquiry tasked the four independent Commissioners with evaluating the testimonial evidence presented at Public Hearings.

Following are some of the guiding principles utilized in the evaluation process:

Impartiality: The independent Commissioners approached the testimonial evidence with impartiality, ensuring that no biases or preconceived notions influenced their assessment. They considered the credibility and relevance of the evidence without favouring any particular party or agenda.

Corroboration: The independent Commissioners sought out corroborating evidence whenever possible. This could include documents, photographs, videos, expert opinions, or other witness-testimony that supported or refuted the claims made by the individuals providing testimony. Corroborating evidence strengthens the overall reliability and credibility of the testimonial evidence.

Witness credibility: The independent Commissioners carefully assessed the credibility of each witness who provided testimony. Factors such as consistency, coherence, demeanour, expertise, and potential biases were considered. The Commissioners were also aware of any potential motivations or conflicts of interest that may have impacted the witness’s credibility.

Cross-examination: Allowing for cross-examination of witnesses was an important aspect of evaluating testimonial evidence. Cross-examination provided an opportunity to challenge and test the credibility and reliability of the evidence presented. The Inquiry provided for a fair and thorough cross-examination process, allowing all parties involved to present their arguments and question witnesses effectively.

Context and relevance: The independent Commissioners considered the broader context in which the testimonial evidence was presented. This included understanding the background, circumstances, and any relevant historical, social, or cultural factors that may have influenced the testimony’s reliability or interpretation. Assessing the relevance of each piece of evidence to the issues at hand was crucial in determining its probative value.

Consistency and contradictions: The independent Commissioners carefully analyzed any inconsistencies or contradictions within the testimonial evidence. Inconsistencies may have raised doubts about the accuracy or reliability of the testimony, while contradictions may have required further clarification or investigation.

Independent expert advice: When necessary, the independent Commissioners sought independent expert advice to evaluate complex or technical aspects of the testimonial evidence. Expert opinions provide additional insights and assist in assessing the credibility and reliability of the evidence.
Transparency and documentation: The independent Commissioners maintained transparency throughout the evaluation process by documenting their reasoning and decision-making. This included providing clear and well-reasoned explanations for the weight given to different testimonial evidence and any conclusions drawn.
5.3.7. Preparing the Report

Several steps were involved in the process of preparing this Report. Following is a general outline of the key elements involved in preparing a final report.

Review of Evidence: Each of the four Commissioners thoroughly reviewed all the evidence presented during the public hearing. This included testimonies, documents, expert reports, and any other relevant materials. The Commissioners analyzed and evaluated the evidence based on its credibility, relevance, and overall weight.

Analysis and Findings: The Commissioners carefully analyzed the evidence to identify key issues, patterns, and relevant facts. They assessed the credibility and reliability of the evidence, considering any corroborating or conflicting information. The Commissioners may have also consulted legal frameworks, relevant policies, and precedents to guide their analysis.

Assessing Legal and Ethical Standards: The Commissioners applied relevant legal and ethical standards to the evidence and testimonies presented. This may have involved considering any applicable laws, regulations, or guidelines governing the subject matter of the Public Hearing. The Commissioners’ analysis and findings aligned with these standards.

Drafting the Report: Based on the analysis and findings, the Commissioners drafted the Final Report. This Report includes an introduction, executive summary, methodology, findings of fact, analysis of legal and ethical issues, conclusions, and recommendations.

Consultation and Peer Review: Before finalizing the Report, the Support Group ensured the accuracy and completeness. Peer review was utilized to help identify any potential biases, errors, or areas that required further clarification.

Including Supporting Documentation: The Final Report includes supporting documentation to provide transparency and credibility. This includes URLs, appendices containing relevant exhibits, transcripts of testimonies, or references to relevant laws, regulations, or policies.

Review: The Commissioners and Support Group reviewed the draft Report for accuracy, consistency, and clarity. Any necessary revisions or edits were made at this stage. The Report also underwent internal review by legal advisors and other experts to ensure its integrity.

Public Release: Once the Report was finalized and approved, it was submitted to the Commission for translation and made available to the public in both official languages of Canada. The Report is published on the Commission’s website, shared with relevant stakeholders. Both electronic and hardcopies of the Final Report are made available to the public on the National Citizens Inquiry website.
Implementation and Follow-up: As a result of the evolving nature of the information and far reaching and transformative recommendations and conclusions contained in the Report, the Commissioners may be called upon to take part in a process of public education and debate. Although largely a process that will be carried out by the Commission itself, the Commissioners may monitor the progress of distribution and provide follow-up reports or recommendations as necessary.

The principles of independence, thoroughness, transparency, and fairness guided the Commissioners’ work in preparing this Final Report.

It must be clearly understood that although it has always been the intent of the Commissioners to include testimony from all sides of the debate, no public authorities responsible for the planning, design, or implementation of the pandemic measures elected to take part in the hearings.

Testimony was invited from representatives of various levels of governments across Canada, and in order to facilitate schedules, subpoenas were issued and government witnesses were given the option of testifying either in person or on video conference at any of the eight hearing locations or at another agreeable time.

Sixty-three members of government, regulators, and authorities were subpoenaed to attend and testify.

ZERO members of government appeared at the Public Hearings to testify.

The majority of these representatives did not even take the time to respond to the Commission.
5.3.8. Concluding Observations on the Process

A public inquiry can be an important mechanism for investigating and addressing significant issues of public concern. But only if that inquiry can be shown to be fair and without bias.

Canadians no longer believe they can rely on their elected representatives or public institutions to provide an in-depth, fair, and impartial evaluation of how governments handled and reacted to the COVID-19 pandemic.

Additionally, media institutions, whose traditional role was to question the actions of government and inform the people in a fair and unbiased manner, failed to question government actions and served instead to simply repeat government and public health messaging without question. At the same time, those media institutions received significant funding from the federal government, perhaps contributing to their reluctance to hold it or any government to account.

The only solution, in these unprecedented times, was to form an independent, citizen-led, citizen-funded and non-biased commission such as the National Citizens Inquiry to undertake this historic task.

The National Citizens Inquiry is paid for and operated by the citizens of Canada. The National Citizens Inquiry is not aligned with any political party. The National Citizens Inquiry was deliberately structured so that the Commissioners were free of influence from any person or source.

The National Citizens Inquiry has received no funding from government.

The National Citizens Inquiry has received no large corporate funding.

The National Citizens Inquiry has received no funding from the pharmaceutical industry.

The National Citizens Inquiry is paid for and operated by the citizens of Canada.

The National Citizens Inquiry is not aligned with any political party nor does it have a political agenda, except to represent the best interests of Canadians.

The Commissioners played a crucial role in ensuring fairness and minimizing bias.

The Commissioners were specifically selected from different geographic areas of Canada.

The background, training, and experience of the Commissioners is varied and represents different perspectives.

Although no human being is truly without certain preconceptions and biases, the diverse nature, experience, and background of the Commissioners helped to recognize those biases and address them so that the overall process and Report was fair and without prejudice.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

All internal discussions, meetings, and considerations of the Commissioners were held in private, fully independent of any undue influence from outside sources.

Readers of this Report should consider several factors when evaluating the fairness and unbiased nature of the National Citizens Inquiry including:

Independence: A fair and unbiased public inquiry must be independent from any undue influence or interference, ensuring that the investigators and decision-makers are impartial and free from conflicts of interest. This independence was achieved through the appointment of the independent Commissioners who were provided with sufficient authority and resources.

Transparency: The National Citizens Inquiry was transparent, allowing for open access to information, evidence, and proceedings. Transparency is essential to build trust in the Inquiry’s findings and ensures that the public has a clear understanding of the investigative process and its outcomes.

Inclusivity: A fair public inquiry should strive to be inclusive, providing opportunities for all relevant stakeholders, including affected individuals, organizations, and experts, to participate and present their perspectives. Inclusivity helps ensure that diverse voices are heard and that the Inquiry’s conclusions are well-rounded and comprehensive. Although this inclusivity was extended to all groups, including various levels of government, government representatives elected not to participate.

Evidence-based approach: A fair and unbiased public inquiry relies on an evidence-based approach where facts, data, and expert analysis form the basis for the Inquiry’s findings. The collection, analysis, and interpretation of evidence was rigorous and objective, taking into account different sources and viewpoints.

Due process and fair procedures: The principles of due process were upheld in the National Citizens Inquiry, ensuring that all parties involved were treated fairly and had an opportunity to present their case, cross examine witnesses, and challenge evidence. Fair procedures, including the right to legal representation, were essential to maintain the integrity of the Inquiry process.

Report and recommendations: A fair and unbiased public inquiry concludes with a comprehensive Report that presents the findings, analysis, and recommendations based on the evidence and investigations conducted. This Report was written in clear and direct language and is accessible to all. The report provides a fair assessment of the issues under investigation, without undue influence or bias.

By adhering to these principles, the National Citizens Inquiry demonstrated its commitment to fairness, impartiality, the pursuit of truth, ensuring accountability, transparency, and the restoration of public trust in matters of significant public interest.
6. Public Hearings

6.1. Overview

Public hearings were held in locations from coast-to-coast in Canada as follows:

- Truro, Nova Scotia: March 16, 17, 18, 2023
- Toronto, Ontario: March 30, 31; April 1, 2023
- Winnipeg, Manitoba: April 13, 14, 15, 2023
- Saskatoon, Saskatchewan: April 20, 21, 22, 2023
- Red Deer, Alberta: April 26, 27, 28, 2023
- Vancouver, British Columbia: May 2, 3, 4, 2023
- Québec City, Québec: May 11, 12, 13, 2023
- Ottawa, Ontario: May 17, 18, 19, 2023

Members of the public who wished to testify at the Hearings were invited to apply through online application forms that were available on the NCI website.

https://nationalcitizensinquiry.ca/testimony/

Members of the public were offered the option of testifying in person or via live video broadcast.

Approximately 900 members of the public applied to testify.

Approximately 300 members of the public testified at the Hearings.

Many more members of the public are currently providing additional testimony, outside of the Public Hearings, that will be included in the Commission record.

Testimony was invited from representatives of all levels of governments across Canada, and in order to facilitate schedules, subpoenas were issued and government witnesses were given the option of testifying either in person or on video-conference at any of the eight hearing locations.

Sixty-three members of government, regulators, and authorities were subpoenaed to attend and testify.

Zero members of government appeared at the public hearings to testify.
As a result of the lack of government representation at the hearings, and to properly represent the government position on various topics, sworn affidavits obtained from various court proceedings involving key government witnesses were read into the record. It was this sworn evidence attesting to the actions taken, press releases, statements of policy, and news articles from mainstream media that were utilized to represent the government position.

Actual video-recorded statements and press conferences were aired at a number of the hearing locations.

Despite the fact that the actions taken by all levels of governments represent the most profound intrusions in the lives of all Canadians, essentially tearing at the very heart of Canadian society, publicly elected representatives and the public service employees declined this opportunity to address the Canadian people.

As a citizen-led initiative, the Commission did not have the ability to compel the government witnesses to appear through judicial subpoenas.

In the ensuing sections and throughout the entirety of the Report, we, as the Commissioners, were devoted to conveying the statements made by the witnesses. However, this should not be interpreted that all four Commissioners were in complete agreement with these expressed views. Each Commissioner came to the NCI from different walks of life and, therefore, could see the witness testimony from different worldviews.
6.2. Public Officials Issued Non-Judicial Summons Letter

In order to accommodate busy schedules, the Commission offered to accommodate the witnesses as either in-person testimony (at a location of their choice) or in-virtual hearings.

Hearings were held in eight cities from coast-to-coast in Canada, spanning a period of time from March 16, 2023, through to May 19, 2023.

An additional option of testifying in a closed session with the four Commissioners at a time outside of the formal hearing dates was also offered.

The following public officials had been issued subpoena letters to participate as witnesses in the hearings.

**No public officials accepted the invitations.**

6.2.1. Truro, Nova Scotia Hearings Summons

Bruce Fitch NB–Summons  
Dorothy Shephard NB–Summons  
Ernie Hudson PEI–Summons

6.3. Detailed Information from the Public Hearings

The reader should be aware that section 6.3 of this Report contains a tabular listing of the witnesses who testified at both the public and virtual hearings.

For a more comprehensive and accurate understanding of the witness testimonies, we strongly advise the reader to refer to the official witness transcripts, which are included in section 12 of this Report. The transcripts provide verbatim accounts of what was said during the meetings and offer a more complete representation of the witnesses’ statements.

Additionally, if you prefer to access videos of the witness testimonies directly, they are also available on the NCI website for your convenience.

Details of each of the eight Public Hearings held across Canada follows.
6.3.1. Truro, Nova Scotia

Public Hearings were held in Truro, Nova Scotia on March 16, 2023, March 17, 2023 and March 18, 2023.

The schedule of witnesses is as follows:

<table>
<thead>
<tr>
<th>Name of Witness</th>

6.4. Exhibit Archive

The following is a list of the Witness Exhibits presented to the Commission during the hearings held across Canada and in subsequent virtual hearings heard by the Commissioners following the completion of the in-person hearings.

This list is current as of September 28, 2023. It should be noted that the list may be updated on the website from time to time, and the reader is encouraged to visit the website at https://nationalcitizensinquiry.ca/exhibits-2/ to review the latest list of Witness Exhibits.

These exhibits serve as a critical record of the testimonies and evidence presented during the hearings, providing valuable insights into the experiences and perspectives of individuals affected by the issues under investigation.

Testimony was invited from representatives of all levels of governments across Canada... ZERO members of government appeared at the public hearings to testify.
7. Analysis

Introduction

Following is the analysis, commentary, and recommendations as put forward by the Commissioners. To facilitate the analysis and review, the information has been divided into various broad areas as follows:

CIVIL

- Legal, policing, policy, regulatory, human rights, emergency preparedness, government, private-public partnerships, anti-trust, monopolies, private corporations;

SOCIAL

- Media, family, faith, education, community, service delivery, societal coercion;

ECONOMIC

- Impacts related to financial matters at all levels—personal, family, corporate—and governmental expenditures and debt, government actions; and

HEALTH

- Medicine, research, pharmaceuticals, regulating and safety monitoring, patient relations, doctor-patient relationship, industry health, messaging, incentives, regulatory collusion.

Each of the categories listed above cannot be fully appreciated independently of each other. Each category is only a part of the much larger whole of the information presented, and specific subject areas cross categories. This reflects the intersectionality of all areas that were considered.
7.1. Civil

7.1.1. Canada’s Justice System

Introduction
The Commission heard testimony regarding the role that Canada’s justice system played in the pandemic response.

Based on the testimony, the Commission has serious concerns about the state of the rule of law in Canada, the real or perceived failure of Canadian courts to protect Canadians from government and administrative overreach, and the neutering of the *Charter of Rights and Freedoms* in the face of a government-declared emergency.

James Kitchen (Saskatoon, SK; Vancouver, BC)

Leighton Grey (Saskatoon, SK)

Bruce Pardy (Toronto, ON)

Lt. Col. David Redman (Red Deer, AB)

Myriam Bohémier (Québec City, QC)

Luc Harvey (Québec City, QC)

Maurice Gatien (Ottawa, ON)

The preamble to the *Canadian Charter of Rights and Freedoms* (the Charter) affirms clearly that Canada itself is founded upon the principle of the rule of law:

> Whereas Canada is founded upon principles that recognize the supremacy of God and the rule of law.

The rule of law is so fundamental to our nation that it is recognized as a pillar of the country in our Constitution.

The rule of law means that the law applies equally to all—including people and the government. It means that no person is above the law, regardless of wealth, race, or personal characteristics. It means that the government itself is bound by the law and cannot act with impunity. The rule of law rejects political influence and popularity, and ensures that each person is treated in the same way in the eyes of the law. The rule of law is of utmost importance to a functioning democracy and is a fundamental principle in the Canadian justice system.

---

2 *Canadian Charter of Rights and Freedoms*, preamble.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The NCI (National Citizens Inquiry) heard repeatedly about the rule of law during testimony. Sadly, the erosion of the rule of law during COVID was a recurring theme of the testimony from legal experts as well as lay witnesses.

The rule of law is not only important to ensure that a justice system functions correctly; the rule of law is equally important to maintaining the confidence of Canadians in their justice system. When the rule of law is subverted, Canadians perceive fundamental unfairness to themselves and their loved ones. This breeds resentment and mistrust and can undermine the very functioning of democracy.

In some ways, the justice system can be seen as a pressure valve on society. It is a place where people who feel wronged can bring their grievances to be heard and resolved. The actions of a court in: (1) hearing a grievance, (2) placing it into context with the other side, and (3) rendering a decision with careful reasons are of utmost importance. Even when the result is not the desired outcome, the mere fact that the process has been conducted fairly can provide relief and understanding to the participant.

However, when members of society lose trust in the justice system’s ability to fairly resolve problems, the resulting frustration and grief can become problematic. When people lose faith in their ability to solve problems through the justice system, the risk that they may take matters of justice into their own hands increases significantly.

The NCI heard extensive evidence that Canadian courts have failed to uphold the rule of law, and failed to instil confidence in the system. The Canadian courts’ response to the impact of COVID measures on Canadians has led to a breakdown in confidence and an erosion of trust in the Canadian legal system. One legal expert who represented many Canadians in lawsuits involving the pandemic measures described his experiences in Canadian courts as consistently being on the visiting team.3

A perception that the government has the advantage in court runs contrary to the rule of law--whether or not the perception is true. Sadly, the testimony heard led the Commissioners to conclude that the advantage was not only perceived; the advantage actually existed. Counsel repeatedly asked legal experts during their testimony if they were aware of any case in Canada where a person had success against the measures and mandates, and not one single lawyer could name such a case in the entire country.

Canadians have been left with the feeling that there is no person to protect them from government overreach. This is worrisome evidence of a breakdown of the rule of law.

The Legislative, Judicial and Executive Functions
Canada’s legal system is comprised of three branches: three branches: the legislative, judicial, and executive.

3 Testimony of Leighton Grey, Saskatoon.
Most Canadians are familiar with the legislative and judicial branches. The legislative branch consists of parliament and each provincial legislature, where elected representatives enact laws. The judicial branch is the system of courts where Canadians go to resolve legal disputes (An extensive discussion of the courts and their role during the pandemic is below.).

What most Canadians are not aware of, however, is the power and reach of the executive branch within Canada and the important role that it played in Canada’s pandemic response. During the pandemic, much of the rule-making power in Canada coalesced into the executive, which resulted in unelected public health officers across the country ruling as petty tyrants, without accountability or oversight.

The Administrative State

Canadians relied on their institutions to serve them during the pandemic. Critical institutions failed, and public policy suffered.

The NCI heard testimony that this partly resulted from an overgrowth of the administrative state, whereby unelected bodies are delegated significant regulation-making and decision-making powers over Canadian citizens. The size of Canada’s administrative state has been growing, and at the same time, Canadian courts have been paying more and more deference to the powers of unelected administrative bodies. This has resulted in a perfect storm, where unelected officials have powers over Canadians, which are largely unchallenged-able in court, and are not subject to oversight through an election.

In Canada, there are three distinct branches that make up the government and state: (1) the elected legislatures, (2) the courts, and (3) the administration. The separation of powers between the branches is intended to protect individuals by ensuring that excessive power does not become concentrated in any one branch.

The only branch that is elected, and thus accountable to the people, is the legislative branch, which, in Canada, is made up of the federal Parliament and the legislatures of each province. The second branch, the courts, is made up of judges who are chosen by the legislature and thereafter have tenure until retirement. Each of the legislatures and the courts are well-known institutions, with well-understood functions in Canadian society. The third branch, however, is not highly visible and is mostly not a consideration to Canadian citizens. However, its power over the lives of Canadians has been growing steadily, and this was revealed during the pandemic.

The purpose of legislatures is to create laws by passing statutes. However, the NCI heard that legislatures have been increasingly “passing the buck” by creating statutes that do not create new laws or rules, but instead delegate rule-making to various unelected administrative bodies. Once such power has been delegated, an unelected administrative body is then empowered to make rules and exercise decision-making powers that impact Canadians. These administrative bodies, however, lack accountability to citizens through civic elections.
The result is that the unelected administration of Canada makes rules that have a profound impact on Canadian citizens. This has become the case for a large number of rules that apply, on a day-to-day basis, to Canadians. It became particularly evident during the pandemic. One example was the health authorities of each province: The public health authority of each province in Canada was empowered to make profoundly restrictive rules limiting Canadians’ freedom of movement, association, and expression. The officials making these rules were unelected and thus felt free to impose whatever measure made sense from the perspective of protecting everyone from one thing only— infection by COVID-19. The NCI was not made aware of a single health authority that took any other consideration into account. At the same time, the NCI heard considerable testimony (documented throughout this report) about the devastating harms that public health measures caused on Canadians and their society, as well as the fact that health authorities surely had early knowledge about the true risk profile of the COVID-19 virus on different parts of the population.

When rule-making and decision-making are delegated to the unelected administrative state, a gap in accountability is created. This gap has grown alongside the growth of the administration itself, as a result of Canadian courts’ decisions that provide great deference to administrators who act within their area of expertise. (See the section below titled “The Standard of Review in Judicial Applications.”)

During the pandemic, the unaccountable administrative state made far-reaching decisions in the name of the “public good.” Individual rights that are purportedly guaranteed under the Canadian Charter of Rights and Freedoms became subverted to this purpose. Courts supported the decisions, often without requiring the administration to actually demonstrate the benefits of their actions, on the basis that protecting the public was the administrative state’s area of expertise. This set a dangerous precedent.

While the most obvious example of this was the public health orders, the administrative state’s power to subvert rights on the premise of “protecting the greater good” was evidenced across many areas of Canada, including the professional bodies that regulate various health professions.

The harms that arose from Canada’s response to the pandemic demonstrated the dangers of allowing an administrative state to govern and make rules on the premise of protecting the public. The purpose of the Canadian Charter of Rights and Freedoms is to ensure that Canadian fundamental rights and freedoms are not subverted by the government, and yet the administrative state appears to have found a way around them, with less scrutiny by a court than would arguably arise if such infringements were inflicted by laws passed in a legislature.

The NCI heard testimony that this subversion could be addressed through creating legislation that enshrines a non-delegation doctrine, as some U.S. states have done. The NCI recommends that this be studied for potential application in Canada. Additionally, the NCI recommends legislated changes to the standard of deference paid by Canadian courts to decisions of the administrative state (which is set out in more detail under the section below titled “The Standard of Review in Judicial Applications”).
Public Health Authorities
The public health authorities in Canada and its provinces took on a regulatory role in an unprecedented manner.

The Commission heard that in Nova Scotia, the Minister of Health issued public health orders under the authority of the provincial health legislation. The first order was made on March 24, 2020, and it underwent 97 iterations, being renewed every two weeks until July 6, 2022. The final order remained in place at the date of the Truro, Nova Scotia hearings. Among the things that were ordered by the public health authority in Nova Scotia were protocols and directives mandating masks and vaccines in certain settings and for certain activities.4

In Québec, the Commission heard that initially a 10-day public health emergency was declared. However, it was repeatedly renewed and changed. Different rules were enacted in each district, and the rules became so complex that even a legal practitioner who was specializing in the area could not keep up. Because the rules were not legislation, there was no central location for a person to learn what was being imposed at any particular time.5

In Alberta, the Premier effectively deputized the Public Minister officer, providing her with the power to make pandemic measures as public health orders.6 By declaring an emergency under the Public Health Act instead of the Emergencies Management Act, the province of Alberta avoided having to implement the Emergency Preparedness Plan that it had spent decades creating and preparing. Instead, the public health authority made orders on the fly, without the benefit of the emergency planning that was well developed and ready to go.

Surprisingly, the Commission heard testimony that when the Alberta Public Health Officer was cross-examined in a court action, she admitted that the public health orders that she made were at the instruction of, and contained the will of, the Cabinet, and not her own. In this way, the government appeared to delegate the power to impose pandemic measures to a health expert, but in reality, the measures were political and made by politicians.

This stunning admission underscores the problems that can occur when matters are delegated by the government. The politicians were able to avoid public criticism for the measures they imposed by providing them under the guise of their medical expert. The courts, in turn, gave excessive deference to the public health authorities, believing them to be making orders based on their expertise.

---

4 Submission of Truro counsel on day 3—after Scott Spidle and before Jessica Blauvelt.

5 Myriam Bohémier, Québec City hearings.

That this happened in Alberta is a clear demonstration of why reform is needed in the area of judicial deference. The Commission recommends that legislation be implemented requiring that administrative bodies whose decisions are subject to the standard of reasonableness be required to demonstrate their expertise and how it was applied to reach the decision. Absent such demonstration, the decision cannot be reasonable.

**Colleges of Physicians and Surgeons**

The Commission heard evidence that the governing bodies over doctors in each province created internal guidelines and directives in respect of doctors’ ability to practise medicine during the pandemic.

*Patrick Phillips* (Truro, NS)

*Michael Alexander* (Toronto, ON)

*James Kitchen* (Saskatoon, SK; Vancouver, BC)

*Natasha Gonek* (Ottawa, ON)

The Commission heard that colleges in Canada had taken these steps:

- Restricted doctors from making public statements that contradicted public health information concerning lockdowns, masks, and vaccines;
- Restricted doctors from prescribing certain drugs—notably ivermectin, zinc, and vitamin D—to patients in order to treat COVID-19;
- Restricted doctors from writing mask and vaccine exemptions for patients;
- Suspended a chiropractor from practising due to failure to mask;
- Disciplined a doctor who refused to get a COVID-19 vaccine due to religious beliefs.

Doctors who did not follow these instructions were subject to investigation and discipline by the College of Physicians and Surgeons of Ontario (CPSO).

There is legislation in each Canadian province establishing self-regulating bodies for doctors (each a college), which is an administrative body that regulates the practice of medicine. In Ontario, the legislation provides that the colleges have two aims: (1) to prevent patient harm, and (2) to establish standards of practice and competence for the profession. The college is required at all times to act in the public interest. But how is the public to know whether or not the college is, indeed, acting in the public interest?
The Commission heard evidence that the colleges governing health professions are private, not-for-profit entities formed for the purpose of being a self-governing body for professions under the applicable health legislation. They are funded by member fees, and their functions are to govern the regulated members in a manner that protects and serves the public interest. Main activities include providing direction and regulation of the practice of medicine and regulating members, establishing standards of practice, approving programs of study, and establishing, maintaining, and enforcing standards for registration and continuing competence.

The separation of the governing colleges from the government itself is intended to serve the public: independent and free from government influence. During the pandemic, however, such separation disappeared. The NCI heard testimony that regulatory bodies took up the government message and instead of independently considering their path, adopted and reinforced the government measures with zeal.

Lawyers across the country described case after case of professional discipline by professional colleges governing doctors, nurses, chiropractors, and others.\(^7\)

One lawyer described defending doctors, and some nurses, who were prosecuted by their colleges for “spreading misinformation.” The charges were that the doctors harmed the public by spreading misinformation about COVID-19. Licences have been suspended and may be permanently revoked.\(^8\) Another lawyer described a doctor who was disciplined for prescribing an off-label prescription drug (a practice that is explicitly allowed),\(^9\) and another doctor who was disciplined for failure to vaccinate (where the doctor’s refusal was based on a religious belief).\(^10\)

Freedom of expression among doctors was jettisoned, and colleges required that doctors not speak publicly against public health policies and recommendations. The Ontario college published this requirement on its website as a “statement.” It was not passed as a resolution, it was not a policy established by the college, it was not in the legislation, nor was it a government directive. Nonetheless, the colleges prosecuted doctors for violating this statement, using their power to investigate and prosecute.

\(^7\) James Kitchen, Saskatoon hearings. Michael Alexander, Toronto hearings.

\(^8\) Michael Alexander, Toronto hearings.

\(^9\) The NCI heard testimony from multiple witnesses that once Health Canada approves a medication, any doctor can prescribe it on an off-label basis. The ability to prescribe off-label is allowed because approved medicines come with a side effect profile and doctors can assess the risks of prescribing it in an off-label manner. See for example, Michael Alexander, Toronto hearings.

\(^10\) James Kitchen, Saskatoon hearings.
The NCI heard testimony that the prosecution of doctors by their colleges, highlighted faults in the system, revealed a lack of transparency in the governance process, and facilitated a chronic abuse of authority by the college system. During the pandemic, the medical colleges sought uniformity in medical messaging and treatment, while squashing dissent and questions among doctors.

Under the law, a college cannot prosecute a doctor without reasonable and probable grounds that the doctor has committed professional misconduct. During the pandemic, the colleges took the novel position that doctors were not permitted to publicly disagree with statements or guidelines from the college or public health authority. This was described as extraordinary. Doctors who violated this new rule were subject to not only investigation and prosecution but also search and seizure of their offices and medical records.

The following questions have yet to be answered:

• In whose interest did the colleges act when they directed members to convey ONLY the government and health authorities’ messaging?

• How could colleges so freely interfere in the patient–practitioner relationship in directing the treatment of patients?

• Should regulators be allowed to censor their membership and prevent them from speaking publicly?

• Who oversees the regulators?

The Commission heard that the colleges engaged in fear based communication—threats of, and actual, discipline—as well as discouraging open discussion and research into best clinical practices.

In the end, the professional colleges simply adopted government messaging and imposed it on their members, when the government did not demonstrate that it was acting in the public interest.

The failure of professional colleges to act independently and ensure that their actions were indeed in the public interest reveals a serious governance issue. An independent, multidisciplinary inquiry into the governance of professional colleges, particularly in the medical field, is warranted.

Recommendations

Based on the witness testimony and the preceding discussion regarding Canada’s justice system and its actions during the pandemic, here are 10 recommendations for improvements:

A. Uphold the Rule of Law: Reiterate and reinforce the importance of the rule of law in Canada’s justice system, emphasizing that all individuals, including the government, are subject to the law.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

B. **Review and Rebuild Confidence in Courts**: Conduct a thorough review of the Canadian courts’ handling of pandemic-related cases and their impact on the rule of law. Rebuild public confidence in the justice system by addressing concerns raised during the pandemic.

C. **Separation of Powers**: Reassert the separation of powers among the legislative, judicial, and executive branches, ensuring that each branch functions independently within its prescribed role.

D. **Limit Executive Authority**: Examine and reform the extent of executive authority during emergencies, ensuring proper checks and balances to prevent unelected officials from making far-reaching decisions without accountability or oversight.

E. **Non-Delegation Doctrine**: Study the implementation of a non-delegation doctrine in Canada, similar to some USA states, to ensure that legislative powers are not unduly delegated to unelected administrative bodies.

F. **Accountability of Administrative Bodies**: Enact legislation that requires administrative bodies to demonstrate their expertise and rationale for decisions, particularly when those decisions infringe on individual rights.

G. **Public Health Authorities Oversight**: Establish a clear framework for oversight of public health authorities’ decision-making processes during emergencies to balance public health needs with individual rights and freedoms.

H. **Transparency in College Governance**: Conduct an independent, multidisciplinary inquiry into the governance of professional colleges, especially those governing medical professionals, to ensure transparency, independence, and accountability in their decision-making. The activities of the colleges must adhere to the Charter of Rights and Freedoms.

I. **Freedom of Expression for Healthcare Professionals**: Safeguard healthcare professionals’ freedom of expression, while ensuring that they provide accurate and evidence-based information to the public.

J. **Protecting the Patient-Practitioner Relationship**: Review the ability of regulators to interfere in the patient-practitioner relationship, ensuring that professional judgment remains independent and guided by the best interests of the patient.

These recommendations aim to address the concerns raised in the discussion and promote a more balanced, accountable, and transparent approach to governance and decision-making during public health emergencies in Canada.
7.1.2. The Response of Canadian Courts

Introduction
The Commission heard testimony regarding the role that Canada’s court system played in the pandemic response.

Based on the testimony, the Commission has serious concerns about the impact of court pandemic measures and the excessive deference paid by the courts to administrative bodies such as public health authorities and professional colleges. The Commission recommends an independent inquiry be conducted into the court’s response.

The Role of Canadian Courts
Canadian courts have an interesting dual role in that they must both: (1) enforce the laws created by the government; and (2) protect Canadians from unconstitutional laws created by the government. In practice, courts actually spend the vast majority of time enforcing and implementing laws. It is rare for courts to be called upon to consider whether laws are appropriate or constitutional in the first place. For this reason, one could wonder whether some courts forget, or are not comfortable with, their role as constitutional guardians who must stand up to the government in defence of citizens.

The imbalance of power between the government and its citizens, however, means that the courts’ role in reining in legislative overreach and preventing rights violations by government bodies (and others) is critical. When the government enacts laws or takes actions that violate the constitutional rights of Canadians, there is no mechanism for protection other than the courts. This is particularly so when the government’s actions are supported by (or, at least, not stopped by) the majority of Canadians.

In an elected democracy, the government can create laws that are popular with the voting majority, but which may harm individuals or minority groups. For this reason, one of the primary purposes of the Constitution, minority populations from the tyranny of the popular majority. The courts, through their tenure and independence, play a critical role in such protection. The courts are the only institution in the country that are empowered to stop government actions from harming the people. Despite this, the NCI heard compelling of evidence that Canadian courts did not hold up their expected role for Canadians.

The NCI heard significant criticisms from legal experts about the lack of protection from the courts in responding to pandemic measures that violated the rights of Canadians. The courts paid deference to the government in its action, which is inconsistent with the rule of law, and the requirement that the government be subject to the law in the same way as its citizens. Among the many complaints heard by the NCI was that Canadian courts:

- participated in the prosecution of religious leaders whose alleged crimes are supposedly protected under the principle of freedom of religion and worship;
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

- gave unquestioned and unwarranted deference to the decisions of administrative bodies that censored medical providers;
- supported the medical system in denying life-saving care to a Canadian on the basis that she would not consent to a COVID injection, despite there being no medical reason for the requirement, and the fact that she could demonstrate evidence of strong natural immunity to COVID;
- supported the government and employers in denying Canadians the right to work and the right to receive Employment Insurance;
- avoided difficult decisions under the doctrine of mootness; and
- did not require governments to demonstrate the supporting proof of the benefits of their policies outweighing the risks, and even took judicial notice of public health positions as unquestioningly true.

These actions by the courts have eroded Canadians’ trust in the judicial process, and have left many feeling hopeless.

Court Shutdowns and Delays
One of the first pandemic responses was to close Canadian courts. The NCI heard that virtually all Canadian courts completely shut down from April to June 2020 (except for emergency matters). Thus the Canadian justice system came to a standstill, delaying cases and creating backlogs. One is reminded of the old maxim: “Justice delayed is justice denied.” The shutdown of courts caused Canadians to lose access to justice as an immediate result.

Upon reopening, many courts implemented the very public safety measures that were being challenged as unconstitutional. Virtual court hearings were required in many cases, which denied complainants their ability to be seen and heard by a judge in person. Mask requirements, and even vaccine passports, were imposed.

The fact that courts imposed the same measures as the rest of society without questioning their efficacy or justification was unbefitting of courts that are supposed to be independent and in control of their own process. Additionally, adopting government measures without question created an implicit bias against anyone who questioned or opposed those measures. For example, if a person wanted to dispute a ticket for refusal to wear a mask, they would be required to attend court in a mask and would be heard by a masked judge who insisted that everyone in his or her presence also wear a mask. It is difficult to see how a person coming to court in that situation could expect a fair and unbiased hearing about whether the masking ticket was reasonable or lawful.
For this reason, courts should not simply accept public health mandates, even in cases of public health emergencies. Canadian courts should have conducted an independent review of the impact of such measures on their own ability to provide justice. As part of this review, Canadian courts could have required the government to demonstrate how the benefits of the measures outweighed the harms. This review could be conducted now, and is recommended to be adopted as part of each court’s process going forward in cases of public emergencies.

In Alberta, a small business applied to court for an injunction to stop business closures. Instead of recognizing the immediate harm that the business was asserting, the court allowed the government six months to prepare its evidence and delayed issuing a decision. At the time of the Saskatoon hearings (April 2023), the decision had still not been issued from the court despite the application being made in December 2020.

In these ways, Canadians experienced a lack of access to justice at a time when they felt they needed the courts.

The Courts Paid Undue Deference to the Government

A former judge who testified to the NCI described the Canadian courts’ approach to pandemic cases as, “If the government makes a policy, then who are we to question it?”

Judicial deference to government COVID policy was a consistent theme heard by the NCI across the country. Courts were reluctant to question public health messaging. Instead, the NCI heard that courts assisted in effectively creating a public health authority that could not be questioned, as public health recommendations were accepted by the courts without any verification or testing. This approach was inconsistent with the rule of law.

In Manitoba, when churches arranged for outdoor or car-based worship services, the police came and arrested the organizers and some attendees for violating the gathering restrictions. The courts, instead of requiring the government to demonstrate the necessity of the gathering restrictions in those circumstances, especially in light of the extreme violation of Charter rights caused by such restrictions, paid deference to the government’s actions. This left citizens with the perception that there was no point in going to court to defend themselves.

---

11 Brian Giesbrecht, Winnipeg hearings.

12 Tobias Tissen, Winnipeg hearings.

13 Brian Giesbrecht opinion, Winnipeg hearings.
In an Ontario family law case, a couple came to court with a dispute over whether to vaccinate a child. The mother brought evidence from experts who discussed the risks versus benefits of vaccination, while the father pointed to the Ontario public health recommendation to vaccinate all children in that age group. The motions judge took significant time to review the evidence from both parents and concluded that the mother, who had sole custody of the child, could make the decision not to vaccinate.

The father appealed this decision to the Ontario Court of Appeal. The Appeal court overruled the decision and held that the lower court should have accepted the provincial health authority’s recommendation.

The NCI heard that this approach caused the burden of proof to shift in cases involving the government. Thus, Canadian courts appeared to give the benefit of the doubt to the government and required ordinary citizens to disprove the government’s conclusions, even where they negatively impact or infringe upon their protected rights. A dangerous precedent is being set.

The Canadian approach could be compared with the U.S. courts, where pandemic measures were repeatedly struck down by the courts. The NCI heard evidence that U.S. courts have struck down a requirement that all air passengers wear face masks and have struck down several vaccine mandates.

The courts’ excessive deference and failure to question the governments’ measures has led to a crisis of confidence in the judicial system. If courts simply take the government’s position at face value, then what is the purpose of having a court at all? There is nobody else in the country that can require the government to justify imposing such draconian measures on its citizens. If the courts refuse to do this, then what is their purpose?

The Commission heard evidence that Canadians trust their institutions and have a general belief that institutions that exist to further the public good should not be questioned. This helps to explain why Canadian courts gave so much deference to public health authorities and administrative bodies such as medical colleges. The danger with holding such a belief, however, is that well-meaning courts can actually participate in harm and the violation of rights by not holding institutions to a high standard.

In order to ensure that Canadian courts properly require the government to justify infringement of Canadian rights, judges need to be selected for, and have confidence in, their ability to hold the government to account and make principled decisions. This is especially so when the decisions are unpopular.

The Standard of Review in Judicial Review Applications

In Canada, government and administrative decisions can be reviewed by a court through the judicial review process. A person who wishes to challenge a government decision, therefore, may

14 J.N. v. C.G., Ontario Court of Appeal.
apply to court to have it struck or reversed. The judicial review process is a critical part of maintaining the rule of law in Canada, as it ensures that the government is not above the law in making decisions that affect its citizenry.

The NCI heard testimony that the standard of review applied by courts in the judicial review process is problematic, cumbersome, overly deferential, and applied inconsistently and incorrectly. During the pandemic times, the judicial review process was engaged by Canadians to review a wide array of decisions including:

- disciplinary decisions of Colleges of Physicians and Surgeons suspending doctors’ licences,
- the decision of the Alberta Minister of Health to close businesses.

The Supreme Court of Canada has established two standards of review that can apply in the judicial review of a decision: (1) correctness, and (2) reasonableness.15 In general, the standard of reasonableness is presumed to apply in all judicial reviews unless there is a question of law that requires the stricter standard of correctness. It is not always evident which standard of review is appropriate to review a particular decision.

The difference between the standards of review is critical, however, as the standard of review that is applied dictates the level of deference that will be given by the court to the decision-maker who issued the decision under review. Under the standard of correctness, there is virtually no deference given, and a court can feel free to substitute its own view about the correctness of the decision. By contrast, under the standard of reasonableness, a court must only review whether a decision was reasonable, meaning that a reasonable person could have reached the decision based on the facts before them.

The standard of reasonableness comes from the Supreme Court of Canada case of Vavilov. This case requires courts to give deference to administrative bodies that are operating within their field of expertise. The Commission heard evidence that the result of this decision has been that no citizen has a chance of successfully overturning a decision or measure when this standard applies. By way of example, Jeffrey Rath testified that the Alberta Chief Medical Officer Dr. Hinshaw, made statements that were negligent, delusional, and not based on facts. For example, Mr. Rath testified that Dr. Hinshaw stated that a person who had received an AstraZeneca vaccine as their first dose was fine to receive a Moderna or Pfizer vaccine as their second dose, despite the fact, according to Mr. Rath) that this was never studied, tested, or proven. Despite this, the reasonableness standard of review requires a court to give her the benefit of the doubt.

---

15 Vavilov v. R., Supreme Court of Canada.
The standard of review also applies to court cases challenging the disciplinary decisions of Colleges against their doctors. Each province has a college that regulates the medical profession and has the power to discipline doctors. This is similar for most medical professions. The disciplinary measures can involve reviewing allegations of professional misconduct, levying fines, and suspending or revoking licences to practise. Where a disciplinary decision is made to suspend a doctor’s licence, this can be subject to a judicial review in court.

The NCI heard evidence in respect of a judicial review involving a doctor whose licence to practise medicine was suspended. The court essentially applied the wrong standard of review by allowing excessive deference to the administrative tribunal. Allowing deference to administrative bodies such as medical colleges is extremely concerning, particularly where decisions are made that affect a person’s ability to work and earn a living. The Commissioners recommend that rules or legislation be enacted that would apply the standard of correctness to disciplinary decisions of professionals, thus ensuring that such persons are entitled to an independent review of disciplinary measures in a court of law.

Failure to provide for meaningful judicial review of disciplinary decisions encourages the application of poor standards by administrative tribunals. This is particularly problematic given the significant impact that such decisions have on the affected member.

The NCI further heard that there is no right to appeal in Ontario where the college’s decision to suspend a doctor’s licence is upheld upon judicial review. In effect, therefore, a doctor has to request permission from the Ontario Court of Appeal to have his or her appeal heard. This is extremely concerning because such a doctor is effectively prevented from earning a living. This type of deprivation should be entitled to review by a higher court. The Commissioners therefore recommend that rules or legislation be enacted expressly allowing for appeals to the Ontario Court of Appeal of a judicial review involving the suspension of a doctor’s right to practise his or her profession.

Judicial Notice
The doctrine of judicial notice is a principle of common law where a court can take judicial notice of a fact without the need of supporting evidence. Taking judicial notice of a fact is supposed to be extraordinary.

The Commission heard that in the past, courts would only take judicial notice of facts that involve no controversy whatsoever. However, in recent years, the upper courts of appeal in Canada have begun to expand the concept.

16 Michael Alexander, Toronto hearings, day 2.
The problem with taking judicial notice of facts is that the practice throws the requirement for true evidence out and substitutes a court’s own view of fact, regardless of the actual evidence presented in court. This practice undermines the principle of Canada’s adversarial system, whereby each side of a lawsuit is entitled to present their evidence, and the judge adjudicates between them.

The Commission heard that in court cases involving pandemic measures, government lawyers would ask the court to take judicial notice of facts such as (1) the severity of the pandemic, and (2) the necessity of the government measures. The problem is that the cases before the court often challenged those exact facts. The practice of judicial notice, therefore, deprived Canadians of their ability to challenge the actions of their government.

Curiously, the one case in which a court refused to take judicial notice of the pandemic and the risks of COVID-19 was when inmates of a correctional facility applied to get out of jail. In that case, the court stated it could not take action to protect inmates from COVID without evidence and that judicial notice was not sufficient. Thus, the perception by members of Canada’s legal community is that the practice of judicial notice was expanded in favour of government actions but never to support the rights of individuals.

Mootness
The doctrine of mootness is an old principle of common law that experienced resurgence in the courts during pandemic times. Essentially, mootness arises when a legal issue that is proceeding before the courts becomes moot, in that it is no longer a live issue. When an issue is moot, a ruling by the court is considered to be hypothetical only, and thus courts do not wish to waste valuable time and resources reaching a decision that will have no real impact.

It is only in rare and exceptional cases that a court will render a decision on an issue that has become moot. Typically, the issue must be of great importance and the principles to come out of the decision would be of great precedential value, regardless of the mootness in the particular circumstance.

The NCI heard that government lawyers defending cases of government violations of Charter rights consistently argued mootness as their first position in court. They were assisted in this by the slow movement of justice in Canada, which meant that by the time many cases reached a hearing in court, the particular measure or mandate had been suspended or removed. That meant it no longer applied and that any decision in favour or against it would technically be moot.

One might have expected that cases involving severe violations of Charter rights due to pandemic measures would be of such importance that courts would rule on it anyway. Instead, courts sheltered themselves from making difficult decisions by claiming mootness, even when restrictions were ever-changing or were suspended with the explicit threat of being re-invoked.\footnote{See, for example, the case against the federal government’s COVID vaccine mandate for air and rail travel.}
Because mootness is a principle of common law, it can be modified or overturned by legislation. It would be appropriate to legislate parameters to the doctrine of mootness, including a prohibition on mootness when the case involves a violation of Charter rights.

Judicial Independence
Because Canadian courts make decisions that have power over citizens and government alike, it is imperative that members of the courts have independence and are not beholden to the government of the day. In principle, judicial independence is laudable and necessary. In practice, it is much more difficult to achieve.

Judges are human, they are citizens of Canada, and they are products of Canadian society. They are former lawyers who have practised law in a particular area, have their own lived experiences, and have formed views which have shaped their biases (conscious and unconscious). They are not untouchable paragons of virtue and fairness who have appeared out of nowhere to rule benignly over questions of law. Thus, perfection in our judicial selection is simply not possible.

In Canada, judges are not elected by the people but are instead appointed by the ruling political party. Once appointed, a judge has tenure essentially for life, meaning that his or her position cannot be threatened even upon issuance of an unpopular decision. Once appointed, judges are free to decide cases without fear of retribution.

In the event that a judge issues an incorrect or controversial decision, there are several levels of appeal through which more judges (often panels containing multiple judges) review the decision. The highest level of appeal is the Supreme Court of Canada. Judges at appellate levels in Canada have themselves been selected (or appointed) by the government, on the theory that they have demonstrated impartiality, competence, and expertise in making fair and reasoned judgments.

In theory, judges are free to make principled decisions that are unpopular and to strike down government actions that infringe constitutionally protected rights and freedoms. In practice, however, the NCI heard that judges were often fearful of COVID, held the same fear-driven views that were propagated daily in the news media, and were not open to or receptive of information that ran contrary to public health messaging.\(^\text{18}\)

The NCI heard evidence that in Canada, judges are selected after being vetted by a judicial selection committee, which reviews the candidates to ensure their competence and quality. The ultimate selection and appointment to the bench, however, is made by the government.\(^\text{19}\) Thus the judicial appointment process is inherently political.

\(^\text{18}\) James Kitchen, Saskatoon hearings.

\(^\text{19}\) James Kitchen, Saskatoon hearings.
The NCI heard evidence that judicial selection in Canada has been shifting “to the left,” meaning that more judges are being appointed who favour government, and fewer are chosen that value individual rights. Over time, this has shifted judicial decision-making towards government deference and away from protecting citizens from their government. The effects of this shift became particularly apparent during COVID.20

There is a perception by some Canadian legal experts that the judicial appointment process in Canada is flawed. In this respect, there were two main criticisms: (1) any system with government appointments is inherently going to reflect political bias; and (2) in Canada, the federal government is responsible for appointing judges of each province’s superior and appellate courts.

Judicial Appointments Versus Elections

One of the main criticisms of the judicial appointment process is that the judiciary will necessarily be made up of people who have been selected by politicians. There is a question, therefore, of whether appointees are selected because they align with, or may be disinclined to challenge, the views and positions of elected politicians. This may reduce the likelihood that courts will rule against the government to protect the citizenry as judges may have been selected for the very reason that they are pro-government.

Some may take comfort from the fact that in a democratic system, the government (at least in theory) changes fairly often, and thus, any bias in judicial appointments should balance out to some extent. What comfort can be taken, however, if one political party or, indeed, ideology dominates the Canadian landscape for a sustained period of time? And what comfort can be taken by citizens whose political interests are unpopular and are thus never reflected in the elected politicians of the country?

The NCI heard submissions from counsel that Canada’s system of government selection and funding the judiciary could be perceived as inconsistent with the rule of law. Other jurisdictions have addressed this issue by providing for elections of judges by direct and popular vote of the citizenry, at least for some levels of court. While elections appear appealing as an antidote to the issues that can arise from a political appointment process, they also carry downsides. For example, we noted above that a court’s role can be to protect minorities from the tyranny of the majority. However, where a judge has been elected by a majority of the citizenry, he or she may align with the majority’s oppressive actions or be disinclined to rule in protection of the unpopular minority.

Whether or not judges should be elected at some levels in Canada, there are certain practices from the U.S. election system that could fit in with the Canadian appointment system and enhance its process. For example, an open debate with public hearings during the judicial appointment process would provide more transparency and might help to alleviate some of the political bias in appointments. This would be particularly appropriate when appointing judges to appellate levels.

---

20 James Kitchen, Saskatoon hearings.
It is clear that no system is perfect, and there are advantages and drawbacks to appointments versus elections. For this reason, the NCI believes that the judicial appointment process should itself be reviewed by a panel or inquiry—with the benefit of a wide range of experts, academics, and experienced practitioners—to determine if reform is needed to the system of judicial appointments.

**Federal Appointments of Provincial Judges**

In Canada, each province has its own set of courts, while Canada maintains a set of federal courts. Many Canadians would be surprised to learn (indeed, several of the NCI Commissioners were also surprised to learn) that the federal government appoints the judges of the superior and appellate courts of each province. When this is combined with the lifelong tenure of judges, it is not difficult to see that this practice can be perceived as providing a significant amount of control over the provinces by a centralized federal government.

It is common and expected in a large country like Canada that different regions have different priorities and ideas about the proper governance of the nation. The confederation of provinces and the separation of powers in the Constitution are intended to allow the provinces autonomy over their own affairs, while also providing for a centralized federal government to coordinate on certain national matters of importance to all.

The confederation is not intended to provide for a federal government that rules over the provinces, nor would that be appropriate, given the substantial separation of constitutional powers. Moreover, given the disproportionate distribution of population across the provinces, it has long been clear that the powers of the federal government tend to be dominated by the interests of the most populous provinces. This begs the question, then: why does the federal government have appointment power over judges that are making the most fundamental rights decisions in each province?

The NCI heard testimony from legal experts recommending that provinces be entitled to appoint their own judges, albeit with appropriate selection processes and corresponding judicial advisory committees. This suggestion makes sense to the Commissioners. However, given the fundamental importance of the judicial selection process, our recommendation is that this should form part of the overall justice system inquiry that should be conducted.

**The Judiciary Cannot Act in Tandem with the Government Prosecution Service**

The Government of Canada is responsible for law and order, as well as enforcing its laws and regulations. This means that in addition to selecting and funding the judiciary, the government also employs and funds the police and prosecution services in Canada. Government responsibility for all these functions can a perception of a conflict of interest (if not an actual conflict of interest).
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The priority of the police and prosecution services is to enforce government laws against people. It is the government that directs them in carrying out their functions. While some may view the role of police and prosecution as achieving the “correct” result under the law, the NCI heard submissions that, in practice, the police and prosecution do not act as protectors of citizen rights. To the contrary, government lawyers appear in court to defend the position of the government. This was particularly so in cases involving pandemic measures.

In effect, the Department of Justice is Canada’s largest law firm, with unlimited resources, prosecuting cases and lawsuits in favour of the government’s laws and decisions. Individual Canadians who seek redress or protection from the courts face a significant imbalance of power and resources.

For this reason, the independence of the judiciary is of utmost importance. Citizens must not have the perception that the entire justice system is stacked in favour of the government, particularly when it comes to violations of their guaranteed rights and freedoms.

Moreover, Canadians should have access to resources when their cases involve violations of Charter rights and freedoms, particularly in a novel setting.

Societal Pressure on the Judiciary

There is no doubt that the uncertainty and fear that accompanied the introduction of the pandemic in 2020 impacted judges as well as everyone else. Members of the judiciary are members of society and share in the same pool of information provided by the news media as the rest of the country. The societal pressure that was imposed on Canada at large was bound to be felt by some, if not the majority, of judges as well. Additionally, since most judges are older, it is perhaps understandable that some would have been fearful for their own personal safety from the virus.

The NCI heard from a former judge\(^{21}\) who described how societal pressure in previous times has impacted judges in their decision-making. He noted that in the 1980s, there was a “satanic panic” that swept North America. Allegations of satanic ritual abuse against children were rampant. There was very strong societal pressure on police and judges to “believe all children,” which resulted in the wrongful conviction of many people. In the aftermath of the panic, it was discovered that many children had been coached to make false abuse claims.

Similarly, spousal abuse got a lot of attention when society began to recognize that it was a real problem. The increased attention was appropriate, but the pendulum swung too far, and there was strong pressure on judges to “believe all women.” Any judge who found in favour of an accused husband or who didn’t accept all allegations of a wife was strongly criticized, sometimes by an Appellate court who oversaw the original judgment.

\(^{21}\) Brian Giesbrecht, Manitoba hearings.
Judges are human and cannot help but be impacted by societal pressures of the day. The NCI cannot recommend that judges be replaced with unemotional robots who are immune to societal panics. Nor would that necessarily be positive, as it is important for judges to have a strong sense of sympathy and fairness that comes from being a human being. However, it is very important to select judges who demonstrate an ability to be impartial during times of strong pressure and who are similarly able to set aside their own personal views on controversial topics and remain open-minded. The political appointment process tends to undermine this, as each government would like to appoint judges who share their approach. For this reason, the NCI recommends that there be an independent selection process that involves members of each political party as well as lay citizens.

The Role of Chief Justices
Each court in Canada has a chief justice, whose function is to administer the court, in addition to being a judge. While the chief justice does not have power over any of the individual judges on a court, he or she does have the ability to select which judges on his or her court will hear which cases. Thus, the case-assignment process actually provides a chief justice with significant influence over the ultimate decisions of a court.

The NCI heard testimony that a large number of court cases were taken up directly by the chief justices of each court and that these tended to result in pro-government decisions. There is a perception that many of the older, more rights-focused judges may have been excluded (deliberately or coincidentally) from cases involving the infringement of Charter rights.22

Despite this perception, it is not recommended that governments legislate measures to direct chief justices in their duties, as this would encroach on judicial independence. It is recommended, however, that case-assignment practices of the courts be included as an item to be examined as part of an inquiry by the courts themselves.

Fear Felt by Legal Practitioners
The rule of law requires a functioning legal system in all ways. Just as important as an independent judiciary is the ability of Canadians to access legal advice and for lawyers to be able to provide such advice in a free and independent manner.

22 James Kitchen, Saskatoon hearings.
The legal profession was not immune from the fear felt by many other professionals in other disciplines across the country. One lawyer who gave advice to members of groups that protested government measures testified that he felt fear of reprisal and prosecution simply for providing his legal services. Once the federal government enacted the Emergencies Act, he understood that any person who participated in providing assistance to any person who protested could have their property seized, have their bank account frozen, be fined, or be arrested. In response, he withdrew thousands of dollars in cash from his bank account. He also began to meet his clients clandestinely, in dark parkades and without cell phones.

These reactions may seem extreme, but considering the fact that people were, in fact, arrested and had their bank accounts frozen under the Emergencies Act, this was not an unreasonable response. As a legal representative of participants in the protests, he was fearful that he would be targeted. He further testified that although he had no evidence of the government intercepting his solicitor–client privileged communications, he considered it to be very possible.

Another lawyer testified that a complaint was filed against him at the Law Society after he criticized the court for its pandemic measures. Such criticism, when done respectfully and academically, should be welcomed in a free society, not punished. The complaint resulted in an investigation by the governing body and was ultimately dismissed as having no basis. However, the mere act of reporting and investigating a lawyer in this circumstance will serve as a disincentive to other lawyers who may wish to speak out. When speaking up to protect freedoms puts your career on the line.

Canada should not be a country in which lawyers are fearful to criticize the court or to provide legal services to Canadian citizens who protest against their government. Lawyers being in fear of losing their licence to practise law when they speak up is an indication of a failure of a free democracy. Legal providers being in fear for their own safety in representing protesters is an indication that Canada is not governed by the rule of law. If the rule of law prevailed, lawyers would not be afraid of their government.

Lawyers should not have to fear for their careers or their safety when performing roles in the justice system. Without fundamental protections for lawyers, the rule of law cannot survive. Even if vindicated at the end of the day, the mere act of threatening the livelihood of lawyers has a chilling effect. Our society should welcome open discourse and should specifically protect those who criticize any branch of the government.

The ability to challenge the government during times of Charter violations and to obtain legal assistance in doing so is critical to maintaining our functioning democracy.

---

23 Robert Ivan Holloway, Winnipeg hearings.

24 The Law Society of each province is the governing body for lawyers and is responsible for licensing lawyers to practise law, as well as disciplining those who breach the code of practice.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Recommendations
Following are recommendations to improve the situations described under each of the separate headings.

A. Protection of Constitutional Rights
- **Judicial Review**: Reinforce the role of Canadian courts as constitutional guardians by actively engaging in judicial review of government actions, especially those that may infringe upon Canadians’ constitutional rights.
- **Robust Assessment**: Develop a rigorous and evidence-based assessment process for cases involving rights violations, ensuring that the burden of proof is not disproportionately placed on individuals. Courts should critically evaluate government actions.

B. Access to Justice and Court Shutdowns
- **Timely Responses**: Implement measures to ensure that court closures, especially during emergencies like the pandemic, do not result in undue delays in access to justice. Develop contingency plans for virtual proceedings, and prioritize cases with immediate consequences.
- **Independent Assessment**: Courts should independently assess the impact of public health measures on their ability to provide justice. Review the necessity and effectiveness of measures like mask requirements and vaccine mandates in a courtroom setting to ensure fair hearings.
- **Public Engagement**: Involve legal experts, practitioners, and the public in discussions about maintaining access to justice during crises.

C. Judicial Deference to the Government
- **Balanced Review**: Encourage a balanced and impartial review process for government policies and actions, rather than automatically deferring to the government’s position. The burden of proof should not unfairly rest on individuals or groups challenging government decisions.
- **Comparative Analysis**: Consider international precedents, such as the approach taken by courts in the USA, where pandemic measures were subject to rigorous legal scrutiny. Analyze and learn from the experiences of other jurisdictions when addressing similar issues.
- **Transparency and Accountability**: Promote transparency in court decisions, ensuring they include clear reasoning and explanations for rulings, especially in cases that involve significant rights infringements. This helps build public trust and understanding.

D. Crisis of Confidence in the Judicial System
- **Public Education**: Launch educational initiatives to inform the public about the role of courts in safeguarding constitutional rights, especially during emergencies. Promote an understanding of the court’s duty to question government actions and protect citizens.
• **Judicial Independence**: Emphasize the importance of judicial independence in preserving the rule of law and protecting individual rights. Judges should be selected and trained to have confidence in their role as independent arbiters of justice.

• **Public Engagement**: Create opportunities for the public to engage with the judicial system, such as public consultations or information campaigns. This can help demystify the legal process and foster public participation.

These recommendations aim to strengthen the Canadian judicial system’s ability to protect citizens’ rights, maintain access to justice, and enhance public trust during times of crisis. Implementing these measures would help ensure that courts fulfil their dual role of enforcing laws, while safeguarding constitutional rights effectively.

E. **The Standard of Review in Judicial Review Applications**

The Vavilov standard of review that pays excessive deference to the decisions of unelected administrative officials prevented Canadians from meaningful access to justice and review of their cases. This was particularly egregious where Canadians were fighting for their rights to bodily autonomy, to work, and to participate as free citizens in society.

The Commission recommends that:

• Legislation be enacted to amend the standard of review in cases where the rights of citizens have been affected. This could be implemented in the applicable Interpretation Acts and in the applicable Bills of Rights.

• The burden of proof should be placed on the administrative body to demonstrate reasonableness in cases where the rights of citizens are affected.

• Statutory protections should be removed for the decisions of health officers to the extent that they cause harm to persons.

F. **Judicial Notice**

• The Commission recommends that legislation be enacted to set strict parameters on the use of judicial notice by courts. Judicial notice should never be allowed in respect of evidence that is being challenged. The normal rules of evidence require a party who asserts a fact to prove that fact. This rule underlies the rule of law and should not be relaxed, even in times of emergency.

G. **Mootness**

• **Legislate Parameters**: Consider legislation to modify or limit the doctrine of mootness, especially when cases involve violations of Charter rights. This could include prohibiting mootness in such cases.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

• **Timely Hearings**: Address the issue of slow-moving justice by implementing measures to expedite hearings, ensuring that cases are heard before measures or mandates are suspended or removed.

**H. Judicial Independence**

• **Diverse Selection Committee**: Ensure that the judicial selection committee includes members from various political parties and lay citizens, not just the government, to minimize political bias.

• **Transparent Appointment Process**: Implement a more transparent judicial appointment process, including public debates and hearings, especially for appellate judges, to reduce political bias and enhance fairness.

**I. Judicial Appointments Versus Elections**

• **Independent Review Panel**: Establish an independent panel or inquiry composed of experts, academics, and experienced practitioners to review the judicial appointment process. Evaluate whether reforms, such as introducing elections at certain levels, are necessary.

• **Balancing Appointments**: Ensure that appointments reflect a balance of judicial independence and government accountability.

**J. Federal Appointments of Provincial Judges**

• **Provincial Appointment Authority**: Consider devolving the appointment of provincial judges to the provinces, while maintaining appropriate selection processes and advisory committees to safeguard quality and independence.

**K. The Judiciary Cannot Act in Tandem with the Government Prosecution Service**

• **Enhance Judicial Independence**: Promote and protect the independence of the judiciary, particularly in cases involving government actions, to ensure that citizens have faith in the fairness of the justice system.

• **Resource Allocation**: Allocate resources to support citizens in cases involving violations of Charter rights and freedoms, ensuring they have access to legal representation.

**L. Societal Pressure on the Judiciary**

• **Impartial Selection**: Emphasize the importance of selecting judges who demonstrate the ability to remain impartial, open-minded, and fair during times of societal pressure.

• **Non-Partisan Selection**: Promote a non-partisan selection process aimed at minimizing political influence when appointing judges who possess strong principles to uphold laws as they are written, while also emphasizing fairness.
M. The Role of Chief Justices

- **Review Case-Assignment Practices:** Encourage courts to review their case-assignment practices to ensure fairness and balance in the decisions made, particularly regarding Charter rights.

N. Fear Felt by Legal Practitioners

- **Support Legal Professionals:** Ensure that legal professionals can perform their roles in the justice system without fear of career repercussions or threats to their safety.

These recommendations aim to uphold the principles of justice, fairness, and the rule of law, while addressing the specific challenges outlined in each section. Implementing them may require legislative changes, policy reforms, and a commitment to preserving judicial independence and protecting the legal profession’s vital role in society.
7.1.3. Labour Law and the Failure of Unions

Discussion
The Commission heard evidence that thousands of unionized employees across the country lost their jobs or were put on unpaid leave as a result of the vaccine mandates. Union members had an even harder time fighting this than non-unionized employees, because under the law they cannot bring direct actions against their employer in court and instead must rely on their union to fight for them.

Unionized employees are largely shut out of the courts and must seek recourse for workplace wrongs through their union, which is the gatekeeper of the grievance process. But what is a person to do when the union itself fails to take up his or her defence—or worse, acts against the employee to enforce compliance with the problematic mandates?

Under the law, union members do not have the right to sue their employer directly. This is because union members are part of a collective agreement, under which they contract out their rights to the union. In turn, the union is obligated to represent the employee against his or her employer. Thus, unionized employees depend solely on their union to fight for their employment rights.

The Commission heard that many unions failed to advocate for their members in defence of the vaccine mandates. Some unions told employees that they must comply with the mandate if they were unable to qualify for an exemption. The Commission heard that one union refused to fight for its member because it had received a legal opinion supporting the employer’s right to impose a mandate.

Some employees attempted to bring human rights complaints without the assistance of their union. These applications were denied on the basis that the court had no jurisdiction. This left employees at the mercy of unions that were uninterested in defending them.

The Commission heard evidence that a group of employees in British Columbia had filed a claim against unions for failure to represent them against their employers. The employees had a difficult time finding a lawyer who would represent them, and the time and expense related to this type of suit is extensive.25

The result is that a large number of Canadian unionized employees had no ability to have a court adjudicate on the applicability of mandates nor to consider the safety of the vaccines being imposed.

Recommendations
Based on the testimony concerning labour law and the challenges faced by union members during the pandemic, these recommendations were formulated to address these issues:

25 Philip Davidson, Vancouver hearings, day 1.
A. **Legislation to Protect Union Members**: The Commission recommends that legislation be adopted to include ensuring the protection of union members where the member asserts

- that Charter rights have been violated as a result of actions of the employer or the union, and
- a grievance against his or her employer that the union fails to, or refuses to, defend.

B. **Review and Strengthen Labour Laws**: The government should review labour laws to ensure that they provide adequate protection to both unionized and non-unionized employees during health emergencies like the pandemic. This should include mechanisms for addressing workplace issues related to mandates and safety concerns.

C. **Enhance Union Accountability**: Labour laws should be amended to hold unions more accountable for representing their members effectively. This could involve regular assessments of a union’s performance in advocating for its members’ rights during crises. Unions should be required to demonstrate that they are acting in the best interests of all of their members.

D. **Ensure Union Transparency**: Unions should be transparent about their decision-making processes and actions during crises. Members have a right to know how their union is advocating for them. Transparency can help build trust between members and their unions.

E. **Access to Legal Recourse**: Labour laws should be revised to allow union members to have access to legal recourse in cases where their union fails to adequately represent their interests. This could include the ability to bring direct actions against employers under certain circumstances, such as when the union refuses to take up their case.

F. **Legal Aid for Union Members**: Governments should consider providing legal aid or support to union members who need to take legal action against their union or employer. This would help level the playing field for employees who find themselves in such situations.

G. **Mediation and Dispute Resolution**: Establish mediation or dispute resolution mechanisms specifically tailored to labour disputes arising from health emergencies. This can provide a more efficient and cost-effective way to address employer-employee issues than lengthy court battles. Reasons for decisions must be made public.

H. **Educate Union Members**: Unions should play a proactive role in educating their members about their rights and the grievance process. Well-informed members are better equipped to hold their unions accountable and make informed decisions during crises.

I. **Encourage Collaboration**: Governments, unions, and employers should work together to develop clear guidelines and protocols for dealing with workplace issues during health emergencies. Collaboration can help prevent conflicts and ensure the best interests of workers are protected.
J. **Whistleblower Protections**: Strengthen protections for whistleblowers within unions and workplaces. This can encourage employees to come forward with concerns without fear of retaliation.

K. **Public Inquiry**: Consider launching a public inquiry into the specific challenges faced by unionized employees during the pandemic. This can help identify systemic issues and inform policy changes.

These recommendations aim to address the shortcomings in labour laws and union representation highlighted during the pandemic. They seek to strike a balance between protecting individual employee rights and maintaining the integrity of collective bargaining agreements.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

7.1.4. The Constitution

The Constitution is the supreme law of Canada.26 The main parts were enacted in 1867 and 1982. The Constitution Act, 1867,27 created Canada as a country, and the Constitution Act, 1982, created the Canadian Charter of Rights and Freedoms (the Charter).

Since the Charter is part of Canada’s Constitution, it forms part of the supreme law of Canada, and governments are therefore not permitted to pass laws that violate the rights that it guarantees.

Canadians were surprised, therefore, when the governments’ responses to COVID not only appeared to violate many of the rights that are guaranteed under the Charter but that the courts supported the government in such violations.

There is a reason that Canada (and many other countries) have enacted constitutional protection for individual rights and freedoms. Governments are not infallible, and institutions cannot be trusted on their own to protect individuals. History has demonstrated that even the most advanced societies can enact oppressive measures and trample on the rights and freedoms of some of their members. Canada is not necessarily immune from this, and its government actions should not be immune from scrutiny.

There is no doubt that many of the government measures in response to COVID violated Canadians’ rights and freedoms under the Charter, including:

- freedom of thought, belief, opinion, and expression (s. 2(b));
- freedom of peaceful assembly (s. 2(c));
- freedom of association (s. 2(d));
- the right to move to and take up residence in any province (s. 6(2)(a));
- the right to pursue the gaining of a livelihood in any province (s. 6(2)(b));
- the right to life, liberty, and security of the person (s. 7);
- the right to be secure against unreasonable search or seizure (s. 8);
- the right not to be arbitrarily detained or imprisoned (s. 9);
- the right not to be subjected to any cruel or unusual treatment or punishment (s. 12);
- the right to be equal before and under the law (s. 15); and

---

26 Constitution Act, 1982, being schedule B to the Canada Act 1982 (UK), 1982, c 11, section 52(1).

27 Formerly the British North America Act, 1867, 30–31 Vict., c. 3 (U.K.).
• the right to equal protection and equal benefit of the law without discrimination based on race, national or ethnic origin, colour, religion, sex, age, or mental or physical disability (s. 15).

The rights under the Charter, however, are not absolute. Section 1 of the Charter provides that the rights and freedoms are guaranteed to Canadians. However, it also provides that the rights and freedoms are subject to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society.

The NCI heard from counsel and witnesses that courts essentially relied on section 1 of the Charter to excuse the governments’ violations of Canadians’ rights and freedoms. During COVID, it appeared that every government response was justifiable under section 1, no matter how fundamentally it affected Canadian individuals.

NCI was not made aware of any case in which a court tested the government’s reasons for infringing the rights and freedoms of Canadians. To the contrary, counsel brought a decision to the NCI’s attention where a Court of Appeal lambasted a lower court judge for not relying on public health authorities, while noting that many courts have taken judicial notice of the safety and effectiveness of the COVID-19 vaccines. To have a decision at the appellate level pay this much deference to the government is of great concern.

Canada is not a country that is founded on the principle of the collective over the individual. To the contrary, Canada’s constitution provides that Canada is founded on the rule of law, and it guarantees the rights of individuals. The courts’ deference to the government in its pursuit of policies that favoured public health, and the protection of the health system over the health of individuals, runs contrary to the rule of law.

Canadian courts’ support of the governments’ pandemic measures have set the dangerous precedent that individuals do not have rights during a crisis. This represents a fundamental change in the relationship between citizens and their government. Prior to the pandemic, individuals and government were equal under the law. The government had powers, such as to govern and protect the nation. The citizens, however, equally had power through their guaranteed rights and freedoms.

The precedent appears to have been set now that, during a crisis, the government has all the power, and the citizens can no longer assert their rights and freedoms. If this is accepted, then the government will be incentivized to characterize more and more circumstances as crises in order to assert power over the people.

When Canada adopted the Charter in 1982, it appeared to guarantee certain fundamental rights and freedoms to each individual in Canada. Multiple experts, however, testified to the NCI that the protection of the Charter has turned out to be illusory, with one lawyer asserting that it only took 40 years for the Charter to be subverted by the government.

---

The pandemic exposed that the Canadian Charter of Rights and Freedoms is weak. It failed to protect Canadians’ basic rights and freedoms during a time when governments imposed the most broad and draconian measures on society.

The importance of the Charter, however, cannot be understated. It is those people who bring cases to court challenging government actions that open the door to information and bring wrongs to light.

**Loss of the Right to Freedom of Expression**

Public policies and pandemic measures enacted across Canada were viewed by many as an assault on the rights and freedoms of citizens. The NCI heard that Canada’s principles and values stem from classical liberalism, which has an extraordinary history over 1000 years; at its core is the assumption that people are born free. The government’s role is to serve the people. It is not the ruler of the people, and it is not above the law. The state is not privileged under the law; instead, it is bound by it.

Of all of the rights that were violated under the Charter, the NCI heard that the freedom of expression was the most essential, and its violation was the most impactful. Medical professionals were instructed not to speak out against public health messaging and were disciplined by their governing bodies if they did. Scientists were dismissed from their positions, dropped by media outlets where they had previously spoken, and censored on the Internet.

Freedom of expression, belief, and conscience is the cornerstone of a liberal democracy. It is not an accident that it is the first fundamental freedom described in the Canadian Charter. Freedom of expression and tolerance of diversity of opinion fosters respectful debate. Through this, innovation is fostered, and society improves.

The Canadian justice system did not support Canadians’ freedom of expression where it conflicted with the public health messaging of the government. This was coupled with undue deference to government officials who had unfettered discretion to enact rights-violating measures that went unchallenged by the courts.

**The Legality of COVID Injection Mandates**

The Commission heard evidence from many Canadians who were required to take a COVID-19 vaccine in order to keep their job. Sadly, the Commission heard from many who were injured as a result.

---

29 David Leis, Winnipeg hearings.
There is a considerable amount of legislation in Canada that requires employers to keep employees safe. During the time of the pandemic, employers relied on public health guidance to implement measures to keep employees safe. Presumably this is how employers who imposed mask and vaccine mandates justified these measures\(^\text{30}\).

In determining whether an employer should be held accountable for harm that may have occurred as a result of a workplace vaccine mandate, the Commission heard from a workplace safety professional that three questions should be asked:

1. Was the employer required to implement the mandate at law?
2. Was it legal to implement the mandate?
3. Did the employer do the requisite due diligence to ensure the safety of employees as a result of the mandate?

The Commission further heard there is extensive legislation that applies to employers that should have prevented them from imposing a mandate, both legally and as a result of performing proper due diligence. Among these is the *Canada Labour Code*, provincial health and safety legislation, a *Genetic Non-Discrimination Act*, and the *Criminal Code*.

Despite the extensive regulatory framework that exists in Canada to protect employees from workplace hazards and dangers, vaccine mandates were implemented in many workplaces and people were harmed as a result.

**Recommendations**

The Commission recommends that legislation be enacted prohibiting employers from imposing vaccine mandates on employees.

A. **Canada should establish** an independent review of its judicial appointment process.

B. **The federal and provincial courts** should conduct a national inquiry into their response to pandemic measures, including a review of:

   a) What role did the court play in protecting the rights of individuals?
   
   b) What role should the court play when a government imposes vast rights-violating measures?
   
   c) Should the government have the ability to impose pandemic measures on courts and the judiciary?
   
   d) What level of independence do the courts have over their own process in implementing publicly recommended or ordered measures?

e) Should guidelines or best practices be adopted for case assignment, particularly in cases that involve alleged violations of Charter rights?

C. **Judges in provincial courts** should be appointed by provincial governments and not the federal government. This recommendation is subject to review as part of the overall review of the judicial appointment process.

D. **The judicial selection** process should involve a review by a panel that involves a wide array of citizens and legal experts with different political views and backgrounds. Recommendations for appointments should be made public.

E. **Canada should establish a fund** to pay for legal services for Canadian citizens who bring cases against the government for a violation of Charter rights or who are defending prosecutions that violate Charter rights. Further study could be undertaken to determine the structure and principles governing the fund. Some fundamental principles should include:
   
a) The fund is governed/overseen by a board which has equal representation from constitutional scholars, lawyers, government representatives, academics, and citizens.

F. **Canada and the provinces** should legislate parameters for mootness, including a prohibition on mootness when a case involves a violation of the Charter rights of an individual.

G. **An independent inquiry should** be conducted into the response of the medical colleges in each province, including a review of
   
a) What role did the college play in protecting the rights of its members?

b) What role should the college play when a government makes recommendations for medical practice?

c) Should there be specific limits placed on the powers of the colleges?

d) What regulations can be put in place to assure that the colleges adhere to the *Canadian Charter of Rights and Freedoms*?
7.1.5. Undermining Democratic Institutions

Introduction

The Commission heard evidence that Canada’s democratic processes were interrupted and undermined during the pandemic.

Rick Nicholls (Toronto)

Stéphane Hamel (Québec City)

Testimony that Politicians Were Pressured to Vaccinate Against Their Will

It is fundamental to Canada’s democracy that elected representatives must be able to participate in the legislative affairs for which they were elected, without undue interference.

Rick Nicholls was a member of the Ontario Legislature from October 2011 to June 2022. He served three terms and was elected as a member of the Progressive Conservative Party. During his time, he was an opposition shadow cabinet minister and deputy speaker of the opposition, and deputy speaker for the legislative assembly.

Elected members of the provincial legislatures serve at the pleasure of the people. While he was a sitting member of the legislature:

- at caucus meetings, the chief medical officer of Ontario and other doctors gave presentations to the members about the new vaccines. He asked questions about the efficacy and safety,
- some colleagues were supportive, but others would not entertain his vaccine hesitancy,
- Premier Ford himself called Mr. Nicholls and asked him to “do me a favour” and get vaccinated,
- he received a call from a Progressive Conservative Party pollster, a campaign chair for the re-elect Doug Ford campaign (who is a lobbyist for pharmaceutical companies), threatening him to get vaccinated within 72 hours or be removed from the Progressive Conservative caucus.

Mr. Nicholls instead declared publicly that he would not get vaccinated. Later that day, a press release was issued by the party removing Mr. Nicholls from the Progressive Conservative caucus. Mr. Nicholls sat as an independent member of the legislature for a while before joining the Ontario Party.

How can the public be confident that their elected representatives are able to serve their interests if they are threatened and coerced to “go along” with something they either disagree with or are hesitant about?
Testimony that Politicians Were Pressured to Not Dissent
The Commission heard testimony from Stéphane Hamel, one of the founders of the Québec provincial political party, the Coalition Avenir Québec (CAQ). In 2020, he was the president of the CAQ, which was the governing party of the province.

When the pandemic measures were first discussed and introduced, he questioned them but understood that it was important not to put doubt in the mind of the population during a time of crisis. However, as more data and information was coming out, he had more questions. The executive of the CAQ cautioned him against speaking out, warning him that it was important for the entire population to be on the same page due to the dangerous virus.

When the CAQ began discussing the implementation of a vaccine pass, Mr. Hamel wrote a letter to the party stating he did not agree with the measure and that he would oppose it. Ultimately, he expressed his position on his personal social media page. The CAQ accused him of not following the party’s constitution and not being in solidarity with the party. They unanimously voted to remove him from the party.

Thus, Mr. Hamel was removed from his political party for criticizing its position, and his voice was silenced. Not only was he silenced, but the party made an example out of him to ensure that there would be no other opposition. If the elected members of a political party cannot speak their minds, the political process is undermined.

Testimony that the Normal Passing of Legislation Was Undermined
The pandemic gave Parliament and provincial legislatures an opportunity to subvert the normal democratic process of passing legislation by passing legislation that gave themselves (and the administration) powers that would not normally be acceptable to the public. Parliament and the legislatures took the opportunity to change their own procedures and adopt practices such as virtual attendance and voting, and extended sessions into evenings when most were not in attendance.

Rick Nicholls testified that in respect of the vaccine measures, he repeatedly challenged the Health Minister in the legislature, as more and more boosters were recommended and the response was always the same—that it’s “safe and effective” and we have to protect others.

Bills are first discussed in caucus. The minister presenting it makes a presentation in caucus, and the other members can ask questions. Then it gets presented in the legislature for readings, amendments, debate, and a vote.

The timing of readings changed during the pandemic. For example, when the Emergencies Act was implemented in Ontario and the government wanted to extend the emergency, the legislature called for third reading on a Wednesday evening, when very few MPPs were around and not many were attending in person. He hurried to attend and asked to remove the provisions that give immunity to pharmaceutical companies. His changes were not accepted, and the legislation was passed.
During the pandemic, insufficient time was given to review and understand proposed bills. Debate was started immediately, and the party dictated how each MPP should vote. Members were given talking points on how to present the bill to their constituents and convince them to support the bill. Members were pressured to not show up for a vote if they would not vote to support it. When one person secretly voted against a bill, they were removed from caucus.

Recommendations

A. **Informed Consent**: Political parties should enshrine the principle of Informed Consent into party rules and constitutions, guaranteeing each member the freedom to make their own decision and to be free from coercion or mandates to receive a medical treatment.

B. **Protection of Elected Representatives’ Independence**: The parties should adopt regulations to protect the independence of elected representatives so that elected officials are able to express their views and concerns freely without fear of retribution from their own political parties.

C. **Whistleblower Protections**: Clear whistleblower protections for politicians and party members who raise concerns about government actions or policies should be established, with protections extending to all levels of government and including all elected officials at all levels of government.

D. **Transparency and Accountability**: Decisions by political parties, municipalities, and school boards should be transparent. Parties should be required to provide clear reasons for any actions taken against their members. This includes publicizing party decisions and disciplinary actions.

E. **Strengthen Party Democracy**: Encourage internal party democracy by allowing members to openly debate and express dissenting opinions on significant issues, especially during crises like a pandemic.

F. **Reform Legislative Procedures**: Review and reform legislative procedures, particularly during emergencies, to ensure that there is sufficient time for members to review and debate bills. Emergency legislation should not bypass the regular legislative process.

G. **Public Consultation and Accountability**: Ensure that significant decisions related to public health measures and emergencies are subject to public consultation and accountability. Decisions should be based on a transparent and evidence-based approach.

H. **Protection of Parliamentary Sessions**: Protect the integrity of parliamentary sessions by maintaining regular working hours and ensuring that important votes are conducted when a significant number of members are present.
I. **Review Emergency Powers**: Review and assess the powers granted to governments during emergencies, such as those under the *Emergencies Act*, to ensure that they are not overly broad and they respect democratic principles. Consider legal mechanisms for parliamentary oversight.

J. **Education on Legislative Processes**: Educate elected representatives and the public about legislative processes and the implications of emergency measures. This includes training for politicians on their roles and responsibilities during crises.

K. **Independent Oversight**: Consider the establishment of an independent oversight body or commission to monitor and evaluate government actions during emergencies, ensuring that democratic principles are upheld.

L. **Protection of Opposition Rights**: Strengthen the rights and protections of opposition parties to allow them to effectively scrutinize government actions, especially during emergencies. This includes timely access to information and the ability to hold the government accountable.

M. **Public Inquiry**: Consider launching a public inquiry to investigate the undermining of democratic institutions during the pandemic. The findings of such an inquiry can inform necessary reforms.

These recommendations aim to safeguard democratic institutions, protect the independence of elected representatives, and ensure that decision-making during emergencies is transparent, accountable, and based on democratic principles.
7.1.6. International Law

International law is different from a country’s own domestic law because it does not represent binding and enforceable rules that are imposed by a government over its people. Rather, international law is a series of principles that are agreed to among countries. When Canada signs a treaty with another country (or countries), it is agreeing to abide by the principles set out in the treaty. However, if Canada does not abide by the terms of the treaty, there are very limited avenues by which the other country can seek to enforce it.

This does not mean that international law can have no effect. In Canada, the Supreme Court of Canada has confirmed that customary international law is adopted into Canadian law. It has further stated that the Canadian Charter of Rights and Freedoms should be presumed to provide at least as great a level of protection as is found in the international human rights treaties to which Canada is a party.31

The NCI heard international law testimony that raised the following two important issues:

- on the one hand, Canada’s vaccine measures violated Canada’s obligations under international human rights law; and
- on the other hand, new developments in international health law may result in Canada becoming, in the event of another declared pandemic, bound to implement intrusive and harmful health measures that arguably violate the principles of international human rights law.

Witnesses

Gail Davidson (Vancouver)

James Corbett (Ottawa)

Canada’s Vaccine Measures and International Human Rights Law

The premise of international human rights law is to guarantee fundamental rights and freedoms to all individuals in the world. Human rights are inherent rights that people have simply as a result of existing. Some examples of human rights are the right to life itself, and the rights to food, education, work, health, and liberty.

There is a significant body of international law that is intended to guarantee fundamental rights and freedoms and which prohibits the restriction of some rights, while conditionally allowing the temporary restriction of others in specific situations.

The right to health is a human right. A lot of work has been done in international human rights law to ensure that the right to health is properly protected from government actions.

31 Gail Davidson testimony, Vancouver hearing.
Despite this, the NCI heard testimony that the measures imposed by Canada and its provinces during COVID-19 imposed, promoted, and allowed the suspension or restriction of health rights, as well as other rights that are guaranteed by international human rights law. In particular, Ms. Davidson testified about the measures that were taken to compel and coerce Canadians to submit to COVID-19 vaccination by restricting and suspending the rights of unvaccinated persons (Vaccine Coercion Measures).

Vaccine coercion measures were undertaken by nearly every level of government. Each of the provinces adopted actual vaccine passports, restricting unvaccinated persons from accessing most places. Municipalities adopted bylaws in support. The federal government restricted unvaccinated persons from flying and travelling by train, which is the functional equivalent of a vaccine passport for travel. The federal government also required the use of the ArriveCan app when entering Canada, which was designed to show proof of vaccination in order to avoid a quarantine order.

That these vaccine coercion measures were harmful to Canadians was evident from the abundant testimony of Canadians who suffered job losses, family rifts, social shaming, depression, and isolation as a direct result.

Vaccine coercion measures violated Canadians’ rights to Informed Consent, right to be free from coercion, and right to be free from medical or scientific experimentation.

The right to Informed Consent, which includes the right to refuse treatment and withdraw consent, is an “essential right” that is protected by multiple international conventions to which Canada is a party, such as:

- United Nations Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (UNCAT);
- United Nations International Covenant on Civil and Political Rights (ICCPR); and

The NCI reviewed an excerpt from Canada’s report to the Committee Against Torture in 2020, wherein Canada explicitly sets out the principles of Informed Consent, and found it to be so compelling that it will be reproduced in its entirety here:
For consent [to medical treatment] to be considered valid, it must be provided voluntarily by a person capable of providing consent and it must refer to the treatment and provider who will perform or undertake the treatment. Consent must also be informed, meaning that certain issues must be discussed with the patient prior to consent being obtained, such as material, expected consequences of the proposed treatment, special or unusual risks of the treatment, alternatives to treatment (and their risks), the likely consequences if no treatment is undertaken, and the success rates of different/alternative methods of treatment. The principle of respect for autonomy, at least in part, underpins the right to Informed Consent.

Notably, the right to Informed Consent is also protected under Canada’s domestic law, through the Canadian Charter of Rights and Freedoms, as an essential part of security of the person.

In Canada, a serious abrogation of Informed Consent was accomplished, in part, through coercion of those persons who did not wish to receive a COVID-19 vaccine. Under international law, coercion is akin to torture or ill treatment, which is prohibited. Freedom from torture has been enshrined in the UNCAT and the ICCPR. The right to be free from coercion is arguably a right that cannot be violated under any circumstances. Despite this, Canadians were subjected to a government-led program with the aim of coercing every single Canadian to receive an injection of a COVID-19 vaccine. That the vaccines were an unknown substance whose safety profile was not understood, which have been shown to cause injury to many Canadians, and for which Informed Consent arguably could not be given, has been demonstrated (see section 7.6 of this Report). Those Canadians who did not wish to receive a COVID-19 vaccine but were coerced into receiving this medical treatment—whether it be to keep their job, to conform to family or social pressure, to travel, or for any other reason—had their right to be free from coercion violated.

Ultimately, when a person’s right to Informed Consent is violated as a consequence of being coerced to take a novel medical treatment with no long-term safety profile, the result is that the person has become a subject of experimentation. Freedom from experimentation became a widely recognized human right after the atrocities of World War II when the international community established the Nuremberg Code. The purpose of the Nuremberg Code was to ensure that no human would ever again be subject to non-consensual experimentation. It is easy to see that the prohibition against non-consensual experimentation is fundamental, because it is essential to each person’s right to life, freedom from torture, and security of the person.

---

32 Information received from Canada on follow-up to the concluding observations on its seventh periodic report, CAT/C/CAN/FCO/7, 16 April 2020 at paras 15, 17, 23.

33 The Nuremberg Code 1947 at para. 1. The Nuremberg Code 1947 was derived from the decision of the Nuremberg Military Tribunal in United States v. Karl Brandt et al. which identified ten conditions prohibiting non-consensual medical experimentation on human subjects.
While the vaccine coercion measures are not comparable to the atrocities that led to the creation of the Nuremberg Code, the Code surely covers all human experimentation and not just when it reaches extreme levels. Nor does the principle require a comparative analysis of just how bad one human experiment was as opposed to another. Any experimentation that is non-consensual and has the potential to cause harm is a serious violation of this human right. This is supported by the fact that the right to be free from experimentation is enshrined in the UNCAT and the ICCPR and is a right that cannot be violated under any circumstances.

The administration of COVID-19 vaccines was an experiment on a nationwide scale. The vaccine coercion measures were justified in many minds by the fact that the COVID-19 vaccines had been approved by Health Canada, creating the perception that their safety had been proven. However, as the NCI has discovered, the approval of the COVID-19 vaccines did not require the manufacturers to demonstrate that they were safe or effective. Instead, the Government of Canada ordered millions of COVID-19 vaccines and created a backdoor approval process to ensure that they became available as quickly as possible. The reality is that the safety of the COVID-19 vaccines was not known at the time that they began to be administered to Canadians, and many Canadians were severely injured and killed as a result. The NCI has determined that the safety of the COVID-19 vaccines was not known, and thus their administration to the population of Canada was the very definition of experimentation.

The vaccine coercion measures were not compliant with international human rights law, were applied to rights that cannot be restricted, were not proportional or temporary in nature, and were not supported by the information and debate necessary to assess their lawfulness.

Other Pandemic Measures and International Human Rights Obligations

The seriousness of the violation of rights caused by the vaccine coercion measures should not overshadow the myriad of other human rights that were violated as a result of government responses to the pandemic.

The Universal Declaration of Human Rights (UDHR)\textsuperscript{34} states that all humans have the following rights:

- Equality and non-discrimination (articles 1, 2);
- Movement (article 13);
- Assembly and association (article 20);
- Work and free choice of employment (article 23);

Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

- Education (article 26); and
- Participation in cultural life (article 27).

These rights were all violated, to some extent, by various government measures such as lockdowns, business closures, school closures, border restrictions (interprovincially and internationally), and vaccine passports.

The NCI heard that some human rights are derogable, meaning that they can be violated in certain circumstances. It is generally acceptable to infringe upon derogable rights during an emergency where violations are necessary to protect other rights and maintain the rule of law. However, any such violations must be lawful, legitimate, necessary, proportional, and temporary.

In the early days of 2020, lockdown orders appeared to be an acceptable breach of certain human rights, since Canadians were led to believe that the emergence of the COVID-19 virus had created an emergency pandemic. Businesses and schools closed, seniors’ homes went into lockdown, and hospitals closed services in order to free up resources in preparation for the onslaught of COVID-19 patients that were expected.

However, within a few short months, it became clear to doctors and hospital workers that there was no onslaught of COVID-19 patients needing critical care. It became clear that the risks of severe outcomes were age-stratified, meaning that the virus posed a serious risk only to the elderly and those with multiple co-morbidities who were in poor health. Despite this knowledge, Canadian governments continued to impose restrictions that violated human rights arbitrarily against entire populations.

Around mid-2020, therefore, and perhaps late 2020, the restrictions ceased to be proportional to the threat posed by the virus to the public at large. Nor were the measures temporary. Prior to the introduction of the COVID-19 vaccines, lockdowns and closures were triggered based on test-case numbers published by the public health authorities. Ignoring the fact that the NCI heard testimony that the case numbers were outright false in at least some cases, the tests themselves have been shown to the NCI to be unreliable in detecting actual rates of active infections.

When the COVID-19 vaccines became available, the government’s message was that the restrictive measures would only stop once everyone became vaccinated. The measures then became focused on unvaccinated people, singling them out for discrimination and poor treatment. Governments and the media actively demonized unvaccinated individuals as being responsible for the continuation of the restrictive measures. This continued despite the fact that as early as the fall of 2021, the public health authorities knew that vaccinated people were continuing to contract and transmit the virus to others.

Ultimately, the violation of human rights caused by the measures may have been justifiable under international law in the early days of the pandemic. However, the continued violations of Canadian human rights year over year do not satisfy any definition of temporary.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The various governments of Canada should have disclosed the information necessary to justify the measures that violated human rights and opened up opportunities for debate.

**Canada Has a Duty to Investigate and Provide Redress for Human Rights Violations**

As a party to various human rights treaties and a member of the United Nations, Canada has an obligation to protect human rights and prevent violations thereof. Where violations of human rights are alleged, Canada has an obligation to take action against those responsible and to provide victims with access to effective remedies.

The NCI heard that Canada has a vaccine-injury compensation program. However, of the many vaccine-injured Canadians that testified, precious few had been accepted into the program. A large number were in the process of being approved and had been waiting for months or more. Many were unable to access the program at all as a result of a refusal by doctors to diagnose their injury as vaccine-related.

Canada has failed in its duty under international law to provide effective remedies to those harmed by the various pandemic measures.

Canada has also not undertaken any meaningful investigation into the violation of human rights that occurred as a result of the pandemic measures. A full public inquiry into Canada’s pandemic measures—properly funded, independent, and with the power to compel testimony, is still needed.

Once a proper inquiry and investigation has occurred, Canada must identify those responsible for human rights violations and hold them to account. The number of victims is large, and to date, remedies have been effectively denied.

**Looming Obligations for Canada to Implement International Health Law**

The NCI heard testimony that there are significant developments underway under the auspices of an international organization called the World Health Organization (WHO) which have the potential to impact Canada’s ability to (1) define a pandemic; (2) declare a pandemic; and most importantly (3) control its response to the next pandemic.

Canada’s ability to control its own response to a pandemic is critical to ensuring that public health measures are in line with its laws, including the Constitution. Additionally, and from a more practical point of view, it is vital that Canada retain its ability to develop localized responses based on its own circumstances, as opposed to broad-brush measures dictated from an unelected foreign source that has no accountability to the Canadian people.

The WHO was founded as a specialized agency in 1948 with the noble goal to promote health and the attainment of the highest level of health of all peoples. Its purpose is to act as the directing and organizing authority on international health work. Canada is a member of the WHO.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The NCI heard testimony that the WHO is evolving into an organization that is less about promoting health and more about controlling the public health actions of its member countries. The problem with allowing the WHO to dictate health measures within any particular country is that each country may have its own view of what health is and the means by which health is to be promoted. The importance of this has been demonstrated over and over again in the NCI’s weeks of testimony, which has laid bare a myriad of health problems that were created by Canada’s pandemic response.

The NCI heard testimony that there are two initiatives currently underway under the WHO:

1. The implementation of a new WHO Convention, Agreement, or Other International Instrument on Pandemic Preparedness and Response (Pandemic Convention); and

2. An amendment of preexisting International Health Regulations.

The Pandemic Convention would be implemented under the WHO’s Constitution, which grants its governing body the power to adopt conventions or agreements within the competence of WHO. Any such convention or agreement that is ratified will oblige each member of the WHO (including Canada) to adopt the convention—unless they notify the WHO of their objection within 18 months. The NCI heard that this means that the Pandemic Convention will be automatically adopted by Canada unless an official objection or reservation is filed.

The creation of this new Pandemic Convention is not a public process. It is being negotiated behind closed doors and will not be revealed to the public until complete. Some hearings have been conducted to allow input from accredited institutions about what the convention should include, but there is no process in place to allow for people to dispute whether the process itself is necessary.

An initial draft of the Pandemic Convention was unveiled earlier this year, and it contains concerning features such as

- increased tools for surveillance, and
- obligations for states to tackle false, misleading misinformation or disinformation.

Without knowing the details of how these will be defined in the Pandemic Convention, this indicates that the WHO is anticipating measures to violate individual privacy and censor dissenting voices as being a standard part of the next pandemic response. However, these types of measures have been identified by witness after witness in front of the NCI as causing severe harm.

The International Health Regulations are a product of decades of work between countries. Originally developed to address only six specific diseases, sweeping amendments and reform were adopted after the SARS hysteria of 2003 to take into account new and novel diseases that may appear in the future. These most recent changes introduced the concept of a declaration of a “public health emergency of international concern” (PHEIC). The declaration of a PHEIC is done by the WHO.
A declaration of a PHEIC opens up powers of the WHO—which can include NATO (North Atlantic Treaty Organization) “boots on the ground” to enforce quarantines and deliver medical aid. It also can create obligations on countries to purchase medical treatments, such as vaccines. The NCI heard that certain studies have concluded that serious conflicts of interest have already been found in respect of the 2009 declaration of a PHEIC for swine flu and the requirement for countries to purchase swine flu vaccines.

The NCI heard that Canada is already under an international obligation to comply and actively assess their compliance with the *International Health Regulations*.

In addition to Canada’s existing obligations under the *International Health Regulations*, sweeping changes are now being proposed that include:

- eliminating the concept of respect for the dignity, human rights, and freedoms of persons from the principles of the *International Health Regulations*;
- giving WHO greater authority over surveillance and monitoring of health threats;
- giving the WHO the authority to declare an “intermediate public health alert,” as opposed to a PHEIC;
- granting the WHO the power to change its medical and non-medical recommendations to respond to a PHEIC from non-binding recommendations to binding;
- working with partners to establish a global health certification network, which would verify the vaccination status of travellers; and
- expanding the scope of regulations to cover not just demonstrable, ongoing health emergencies but to cover all risks that have the potential to impact public health.

With the implementation of these two processes, we see an unprecedented attempt at shifting the responsibility for Canada’s public health to a foreign unaccountable body. And while it is true that Canada is a sovereign nation that ultimately has control over its responses to public health situations, these new processes may provide cover for politicians that are motivated to implement unpopular measures that affect the Canadian people.

The existing international health infrastructure under the WHO and the *International Health Regulations* explains why Canada and most of the Western world appears to have followed the same plan and implemented the same measures in response to COVID-19. This one-world approach to health responses actually has the potential to cause greater damage. It turns out that in hindsight, the measures enacted were not the correct response. Thus, the danger of coordinating responses under one umbrella is that a disaster could, in fact, be magnified instead of mitigated.

The results of these proposed changes appears to be the concentration of power over public health into fewer hands.
While international coordination of public health measures sounds like a noble and laudable goal, Canada should not cede its sovereignty, nor its ability to manage its own circumstances, to a foreign, unelected body. Because health issues and outcomes vary depending on each region’s unique circumstances, international coordination of health responses should be voluntary and recommendatory only.

Moreover, it is difficult to reconcile Canada’s potential new obligations under the Pandemic Convention and the International Health Regulations with Canada’s obligations under International Human Rights law (discussed above under the section entitled, “Canada’s Vaccine Measures and International Human Rights Law”).

Recommendations

Based on the information provided in the testimony and other considerations, here are some recommendations on what Canada could do concerning international laws and treaties, especially in the context of the COVID-19 pandemic and potential future health crises:

A. **Pandemic Convention**: The NCI recommends that Canada register immediate reservation against the Pandemic Convention and the amendments to the International Health Regulations once they are put forth by the WHO to allow time for proper consideration of the initiatives and their potential impact on Canada. At the same time, Canada should conduct a public inquiry and consultation into the benefits and risks of both its current obligations under the WHO, and the proposed Pandemic Convention and proposed amendments to the International Health Regulations.

B. **Review and Comply with International Human Rights Law**: Canada should thoroughly review its COVID-19 response measures in light of international human rights law. It should ensure that measures taken during the pandemic—such as vaccine measures, lockdowns, and restrictions on movement—consider international human rights standards. If any violations are identified, corrective actions should be taken.

C. **Strengthen Informed Consent**: Canada should reinforce the importance of Informed Consent, especially in the context of medical treatments like vaccines. It should ensure that individuals have access to comprehensive information about medical treatments, including potential risks and benefits, and have the right to refuse treatment without coercion.

D. **Enhance Vaccine Injury Compensation**: Canada should assess and improve its vaccine injury compensation program to make it more accessible to those who have suffered harm due to vaccinations. This should include a transparent, streamlined claims process, and increased transparency.

---

E. **Conduct a Comprehensive Inquiry**: Canada should initiate a comprehensive and independent public inquiry into its pandemic response measures. This inquiry should have the authority to compel testimony and access relevant information. It should identify responsible parties for any human rights violations and recommend appropriate remedies.

F. **Monitor WHO Developments Closely**: Canada should closely monitor and participate in negotiations related to the World Health Organization’s Pandemic Convention and amendments to the *International Health Regulations*. It should advocate for transparency, respect for national sovereignty, and the protection of individual rights in these international agreements.

G. **Protect National Sovereignty**: Canada should maintain its sovereignty over public health decisions. While international coordination can be valuable, it should not infringe on Canada’s ability to tailor its responses to its unique circumstances. Any international agreements should be voluntary and non-binding.

H. **Balance Health and Human Rights**: Canada should strike a balance between public health measures and human rights. While protecting public health is crucial, measures taken during health emergencies should be lawful, legitimate, necessary, proportional, and temporary. Canada should avoid disproportionately infringing on human rights.

I. **Promote Transparency and Debate**: Canada should ensure that information relevant to pandemic measures is disclosed to the public, allowing for informed debate and discussion. Public health measures should be debated openly in democratic forums, allowing for diverse perspectives to be considered.

J. **Provide Redress for Victims**: Canada should ensure that victims of human rights violations, including those resulting from pandemic measures, have access to effective remedies. This includes compensation for losses and harm suffered due to these violations.

K. **Engage with Civil Society**: Canada should engage with civil liberties organizations, human rights advocates, medical professionals, and other relevant stakeholders, including the public, to ensure that responses to health crises are well-informed and respectful of human rights.

These recommendations are aimed at ensuring that Canada’s responses to health emergencies uphold international human rights standards, protect individual freedoms, and safeguard national sovereignty, while promoting public health. It’s important for Canada to strike a balance between these critical considerations in its domestic and international actions.
7.1.7. Coercion Does Not Equal Consent

Introduction
The principle that coercion does not equal consent is universally accepted as true in the case of sexual activity. It is hard to see how it is not equally as true when it comes to providing a medical treatment such as a vaccine—even more so when the medical treatment is a novel treatment with no long-term safety or effectiveness data.

Discussion
Coercion refers to the use of tactics like pressure, trickery, or emotional force to get someone to do something they otherwise do not want to do. Consent is not freely given if a person is pressured or threatened to agree to something.

What is surprising is how easily Canadians and their courts accepted coercive government actions in pursuit of getting every person injected with the same substance, regardless of a person’s medical history or risk for serious disease from COVID-19. The hard-won principle of “my body, my choice,” gained by feminists after years of fighting for the rights of women to control their own bodies, vanished during the second year of the pandemic. It was replaced with a constant drumbeat by public officials, supported by the media, of safe and effective, which was accompanied by politicians and public figures stating that measures would not be lifted unless everybody “did their part.”

Canadians who hesitated to get vaccinated were branded as anti-vaxxers, despite having voluntarily received every other vaccine, recommended by public health, in their lives. Politicians encouraged people to blame the unvaccinated for the restrictive measures that stopped them from getting back to normal. Those who had taken the COVID-19 vaccines felt morally superior and validated in scorning those who didn’t “do the right thing.” Public shaming became a societal norm.

Witness after witness took the NCI stand and proclaimed, “I am not an anti-vaxxer,” at the same time as refusing to take a COVID-19 vaccine. Why did they feel the need to make such a proclamation? Because Canadian society had devolved to the point where open denigration of the unvaccinated was permitted and even encouraged.

Coercion was applied in virtually every aspect of Canadians’ lives. Workplace mandates caused many to accept a COVID-19 vaccine who didn’t want one. People who supported their families simply couldn’t afford to lose their jobs. The NCI heard from many witnesses that they or a loved one felt compelled to take the injection, under the threat of losing their livelihood. This does not resemble freely given consent.

Vaccine passes were designed to encourage vaccination by denying the unvaccinated access to everything not deemed essential. Thus, people were denied access to their own children’s schools and sports events, to their vulnerable relatives in long-term-care homes, and to basic services such as gyms, restaurants, and movie theatres. The message was clear: If you want access to these people/things that you like/love, you must submit to vaccination. This is not freely given consent.
Vaccine passes were required for businesses, such as liquor stores in some provinces, that are frequented by vulnerable people. This ensured that persons with addiction problems would get vaccinated in order to gain access to their drug. At the same time, support services such as Alcoholics Anonymous had been locked down, ensuring that alcoholics had only one path: vaccination. Taking advantage of people’s vulnerabilities in this way was shocking and un-Canadian.

How did this principle that coercion does not equal consent become forgotten? Was it overlooked or deliberately buried?

The NCI heard testimony that legal opinions were obtained by some employers who implemented vaccine mandates in the workplace. Since we did not have the benefit of reviewing any of these opinions, we can only guess at how lawyers could justify the coercive nature of workplace mandates. One legal expert testified to the NCI that vaccine passports would likely not be viewed as breaching Charter rights, since each person technically had the right to refuse a vaccine. The reasoning being that even if exercising the right to refuse resulted in a loss of the ability to work, travel, or generally participate in society, then this was a voluntary choice. Presumably, this type of reasoning was used to support the mandates.

This likely explains how much of Canadian society appeared to easily adopt the view that choices have consequences, in order to rationalize the coercive measures applied to unvaccinated people. However, it begs the question of where the line is between a voluntary choice and coercion. Wherever that line lies, it is difficult to see how the threat of losing your ability to financially support yourself and your loved ones could be anything but coercion.

If the loss of your job wasn’t enough of a coercive force, the Government of Canada further increased pressure by declaring that employment insurance would be denied to those who lost their jobs due to a refusal to get vaccinated. This ensured there was no financial safety net for those who accepted job loss as the consequence of their decision not to receive a COVID-19 vaccine.

The employment insurance program in Canada is designed to be a safety net for Canadians. It is not a voluntary program; employees must pay into it. In return for a deduction off of every paycheque, employees expect that they will receive financial assistance in the event of job loss. Virtually every witness who testified about losing their job due to a vaccine mandate also testified that they were denied employment insurance benefits. The denial of these benefits served only one purpose: to cause as much financial pressure as possible on Canadians to accept a COVID-19 vaccine. This is not freely given consent.
Instead of using scientific evidence to convince people of the benefits of the COVID-19 vaccines, governments discussed vaccine hesitancy as something distasteful and used it as a wedge issue to turn Canadians against each other. The government could have engaged in a campaign to encourage vaccination by, for example, demonstrating that increased vaccination rates would result in, or were resulting in, better health outcomes. Instead, governments openly admitted that vaccine measures were aimed at modifying behaviour.

Moreover, the NCI discovered that the data published by health authorities was dishonest when comparing vaccinated against unvaccinated persons in areas such as infections, hospitalizations, and deaths. It was discovered that health authorities continued to count people as “unvaccinated” for 14 days following an injection. In this way, all infections, hospitalizations, and deaths in that 14-day window were attributed to unvaccinated people—despite occurring in people who had received a COVID-19 vaccine. At the same time, the people in this 14-day window had higher rates of COVID infection, hospitalization, and death than people who had received no COVID-19 vaccine. Publishing skewed data in this dishonest way led people to conclude that they should get vaccinated. Soliciting consent based on dishonesty is inherently coercive.

The Government of Canada’s intent to push vaccination on every member of its population appears to have its origins early in the pandemic, before any vaccines existed at all. Natasha Gonek testified that in 2020, prior to the existence of any COVID-19 vaccines, the Government of Canada created the Immunization Partnership Fund. This initiative was funded with $45.5 million for the stated purpose of helping Canadians make informed vaccination decisions. Some of the specifically targeted groups for the project were newcomers to Canada and pregnant women. This leads to the troubling question: How much effort and study did the Government of Canada put into determining the coercive steps it could impose on Canadians?

The problem with the “choices have consequences” position can be easily demonstrated by applying it to other situations, such as coercion to participate in sexual activity or coercion to undergo reproductive sterilization. It is easy to see why you cannot threaten someone that they might lose their job if they refuse to engage in sexual activity. Why, then, was it okay to threaten people’s jobs over an injection?

---

36 The NCI watched video evidence from press events in both British Columbia and Newfoundland and Labrador, wherein government officials acknowledged that their measures were aimed at changing behaviour, as opposed to creating better health outcomes.
The pressures felt by those who didn't want a COVID-19 vaccine were demoralizing and dehumanizing. Witness after witness testified about feeling alone, isolated, depressed, and dejected. Many described having suicidal thoughts. People testified about being banned from family and social events, being threatened by neighbours, being shamed at work, being attacked on social media, and being denied contact with grandchildren, parents, grandparents, and other family. Many spoke of pressure from friends and family to “do the right thing,” imparting a moral judgment on their personal medical decision. One witness was told that she had “blood on her hands.”

Institutes of higher education and colleges imposed the same measures as many workplaces, requiring a COVID-19 vaccine not only to attend classes in person but also online classes. The denial of online access was intended to coerce students to get vaccinated. By denying them any access to education at all, post-secondary students were forced to either give up their education goals or submit to vaccination. This was coercion.

The Government of Canada made the vaccine mandates the main issue in a snap election called in the fall of 2021. Shortly after the election, the government announced the implementation of vaccine mandates for travel, both domestic and international. In the world’s second-largest country (by area), a vaccine requirement for planes and trains amounted to an inability for Canadians to travel for work and to visit family. Canadians were also effectively prevented from leaving their country by these measures, as the only land border is with the United States, which had imposed a vaccine mandate for entry.

The Prime Minister of Canada cruelly announced that unvaccinated people would not be able to sit on planes next to vaccinated people, to the cheers of a crowd of people. At this same time, it was already known that vaccinated people could transmit the COVID-19 virus to other vaccinated people. This inconvenient fact went unacknowledged so that pressure on the unvaccinated could continue.

Governments across the country embarked on a coercive mission to get every Canadian vaccinated, regardless of whether they wanted it or not. Any person who resisted vaccination faced the denial of basic rights and freedoms that were allowed to other Canadians. The restrictions were designed to make life difficult until people submitted to vaccination. No measure was too strong. Ultimately, the only step that wasn’t taken was holding people down and forcing an injection into their arm.

When did coercion become acceptable in Canada? Will the vaccine measures and mandates go down in history as a grave societal mistake? How long will it take before Canadian politicians, media, and the courts recognize the harms and indignity that were inflicted on people in the name of a novel medical treatment?

37 Kristen Nagle, Ottawa hearing.
The testimony of Canadians at the NCI cries out with the pain suffered as a result of coercion in the name of COVID-19 vaccines. In the end, we were unable to discern any justification for the coercive vaccine measures. The governments of Canada should apologize to each and every Canadian who was harmed, and commit to never employing such measures against the Canadian population again.

**Testimonial Examples of Coercion**

Patients who had experienced vaccine injury, as confirmed by a physician, were contacted by public health authorities who recommended that they take another COVID-19 vaccine. (Dr. Patrick Phillips, Truro, NS)

A patient who required an organ transplant was taken off the surgery waitlist due to her refusal to accept the COVID-19 vaccine. She did accept re-vaccination of all childhood vaccines and had proof of COVID antibodies. Despite this, the doctors refused to perform her surgery unless she consented to a COVID-19 vaccine. The NCI has learned that she has since passed away. (Sheila Lewis, Ottawa, ON)

People who were suspended or fired from their jobs as a result of vaccine mandates at work, most of whom were also denied any employment insurance benefits:

- **Cathy Careen** (Truro, NS)
- ** Vonnie Allen** (Truro, NS)
- **Terry LaChappelle** (Truro, NS)
- **Amie Johnson** (Truro, NS)
- **Sabrina McGrath** (Truro, NS)
- **Joe Behar** (Truro, NS)
- **Janessa Blauvelt** (Truro, NS)
- **Linda Adshade** (Truro, NS)
- **Katrina Burns** (Truro, NS)
- **Tami Clarke** (Truro, NS)
- **Oliver Kennedy** (Toronto, ON)
- **Victoria McGuire** (Toronto, ON)
- **Lynn Kofler** (Toronto, ON)
- **Sean Mitchell** (Toronto, ON)
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

- Cindy Campbell (Toronto, ON)
- Kimberly Snow (Toronto, ON)
- Greg Hill (Toronto, ON)
- Ksenia Usenko (Toronto, ON)
- Dr. Eric Payne (Toronto, ON)
- Jason Kurz (Toronto, ON)
- Scarlett Martyn (Toronto, ON)
- James Erskine (Winnipeg, MB)
- Sean Howe (Winnipeg, MB)
- Devon Sexstone (Winnipeg, MB)
- Jessica Kraft (Winnipeg, MB)
- Michelle Malkoske (Winnipeg, MB)
- Cindy Stevenson (Saskatoon, SK)
- Ryan Orydzuk (Saskatoon, SK)
- Elodie Cossette (Saskatoon, SK)
- Bridgette Hounjet (Saskatoon, SK)
- Chantel Kona Barreda (Saskatoon, SK)
- Jody McPhee (Saskatoon, SK)
- Jacques Robert (Red Deer, AB)
- Scott Crawford (Red Deer, AB)
- Babita Rana (Red Deer, AB)
- Grace Neustaedter (Red Deer, AB)
- Suzanne Brauti (Red Deer, AB)
- Darcy Harsch (Red Deer, AB)
- Philip Davidson (Vancouver, BC)
A woman had a stroke after her first injection of a COVID-19 vaccine. She was advised to get a second dose and that if she had concerns about having another stroke, then she should get it before her prescription for blood thinners ran out. She was denied a medical exemption from the second dose by her physician. She therefore lost her job. (Leigh-Anne Coolen, Truro, NS)

People who testified that they felt coerced to take the vaccine to keep their employment, comply with rules to visit or care for a loved-one, to travel or to attend school:

- **Peter Van Caulart** (Truro, NS)
- **Ellen Smith** (Truro, NS)
- **Josephine Fillier** (Truro, NS)
- **Marc Auger** (Toronto, ON)
- **Prof. Heather Church** (Toronto, ON)
- **Carley Walterson-Dupuis** (Winnipeg, MB)
- **Steven Kiedyk** (Winnipeg, MB)
- **Charlotte Garrett** (Saskatoon, SK)
- **Krista Hamilton** (Saskatoon, SK)
Tragically, almost every person who testified that they were coerced to take the injection also reported that they had suffered an injury as a result.

Recommendations

The report highlights various instances of coercion and its impact on individuals’ decisions regarding COVID-19 vaccination. To address these issues and mitigate the failures of the system, here are eight recommendations:

A. Protect Individual Rights

- **Legislation Against Coercion**: Introduce legislation that explicitly prohibits coercive tactics, whether by employers, educational institutions, or any other entity, in relation to medical treatments, such as vaccinations. Ensure that individuals have the freedom to make informed choices without undue pressure.

B. Transparency and Accountability

- **Require Organizations to Provide Legal Basis of Mandates Imposed**: Conduct a comprehensive review of the legal opinions obtained by employers who implemented vaccine mandates. Ensure these opinions align with fundamental principles of consent and individual rights. Publish these legal opinions for public scrutiny.

C. Access to Education and Work

- **Online Learning Options**: Ensure that individuals who choose not to get vaccinated have access to online education, especially in institutes of higher education, to avoid coercion through denial of educational opportunities.

- **Job Protection**: Enact legislation to protect employment insurance benefits for individuals who choose not to get vaccinated. Losing employment due to vaccine refusal should not lead to financial hardship.
D. Informed Decision-Making

- **Factual Communication**: Government and public health authorities should communicate drug information transparently and factually. Encourage vaccination through education, emphasizing the benefits of vaccination rather than resorting to coercion.

- **Accurate Data Reporting**: Ensure accurate reporting of COVID-19 data, including vaccine effectiveness, and avoid any manipulation or misrepresentation that may lead to coercion.

E. Address Vulnerabilities

- **Support Vulnerable Groups**: Recognize and support vulnerable populations, such as those with addiction issues, with strategies that do not resort to coercion. Ensure they have access to essential services and support networks.

F. Independent Oversight

- **Ombudsman or Commission**: Establish an independent body, like an ombudsman or commission, to investigate cases of coercion and violations of individual rights related to vaccination. Provide a channel for individuals to report coercion and seek redress.

G. Avoid Political Exploitation

- **Ethical Political Discourse**: Encourage ethical political discourse around public health measures, including vaccinations. Ensure that political campaigns do not exploit vaccination issues or use coercion for political gain.

H. Rebuild Trust

- **Public Apology**: Governments should issue public apologies to individuals who felt coerced into vaccination and acknowledge the harms caused by these coercive measures. Rebuilding trust should be a priority.

These recommendations aim to strike a balance between promoting vaccination for public health and respecting individual rights and choices. They seek to prevent coercion, protect individual freedoms, and rebuild trust between the government and its citizens, especially in the context of medical treatments like vaccines.
7.1.8. Emergency Planning & Plan Execution

Introduction
An essential role of any government is to plan for and act appropriately during times of national or regional emergencies. This function of government has been recognized in Canada for decades, and in the 1950s the federal government established a training college to provide emergency training courses and to foster training and cooperation in emergency situations between federal, provincial, and territorial governments.

Emergency response training is still provided by the federal government through the Canadian Emergency Management College.

On their website, Public Safety Canada\textsuperscript{38} states the following:

Natural disasters, pandemics, cyber incidents and terrorism can all cause emergencies in Canada. Emergencies can quickly escalate in scope and severity, cross jurisdictional lines, and take on international dimensions. Emergency management planning can save lives, preserve the environment and protect property by raising the understanding of risks and contributing to a safer, prosperous, sustainable, disaster resistant, and resilient society in Canada.

Emergency management is a core responsibility of the Government of Canada and a collective responsibility of all federal government institutions. This is why Public Safety Canada is taking steps to promote a coordinated approach and more uniform structure to the management of emergencies by providing guidance to federal government institutions on how to develop emergency management plans. A coordinated approach to emergency management planning will strengthen the Government of Canada’s capacity to prevent, protect against, respond to, and recover from major disasters and other emergencies.

The “Emergency Management Planning Guide” supports federal institutions in meeting their responsibilities under the \textit{Emergency Management Act} to prepare and maintain mandate-specific emergency management plans. The Guide provides the framework for federal government institutions to undertake mandate-specific all-hazards risk assessments and planning activities within all four integrated functions of emergency management:

- mitigation/prevention,
- preparedness,
- response, and
- recovery.

The Government of Canada has a federal policy for emergency management, as set out on the following website:

According to the federal policy for emergency management:\(^{39}\)

The federal government is responsible for emergency management at the national level in its exclusive jurisdictions and on lands and properties under federal responsibility. Provincial and territorial governments exercise responsibility for emergency management within their respective jurisdictions except where legislation allows for direct federal intervention or for shared responsibility. If any emergency threatens to overwhelm the resources of a province or territory, federal institutions may respond to the request or if an emergency has a national implication. A provincial request for assistance during an emergency indicates that the province requires federal support to achieve an objective. While the province may indicate the specific resources and capabilities required, in most instances federal departments and agencies will need to define the appropriate response. Federal institutions can also make preparations in advance of anticipated need or request for assistance from a province or territory.

In researching how the provincial governments have integrated their own emergency response programs, a number of provincial programs were reviewed.

The government of Manitoba’s website includes a copy of The Emergency Measures Act which sets out the responsibilities of the provincial and municipal governments in case of an emergency.

Other provincial governments and territories in Canada have similar legislation to deal with emergencies.

In Ontario, the legislation is called the Emergency Management and Civil Protection Act.

In Alberta, the legislation is called the Emergency Management Act.

It is imperative, following the implementation of emergency plans during the COVID-19 pandemic, to evaluate the emergency measures undertaken to evaluate their effectiveness in mitigating the risks associated with the COVID-19 outbreak, and to determine whether or not the steps taken actually adhered to the legislation at all levels of government as set out by the various legislations.

To undertake this task, the Commissioners have relied on the testimony of various witnesses who appeared at the hearings.

---

\(^{39}\) Section 2. Preamble, 2.3 subsection. (accessed October 31, 2023)
Testimony Concerning Emergency Planning & Plan Execution During Pandemic

Direct testimony was received from witnesses concerning the actions of the various levels of governments during the COVID-19 emergency or pandemic.

Witnesses included the following:

**Lieutenant Colonel David Redman**
Canada Deviated from Strategic Pandemic Response

Lt. Col. Redman testified that most provinces and territories in Canada approach emergencies in a similar way. The emergencies measures organizations in Canada are tasked with responding to all manner of emergencies in Canada, while mitigating the effects of the emergency on the totality of Canadians’ society.

Every province and territory in Canada had a pandemic plan prepared prior to the declaration of the COVID-19 pandemic in March of 2020.

The following was taken from the Pandemic Alternative Website, as presented by Lt. Col. Redman:

**Pandemic Plans from around Canada**

**Pandemic plans listed on the Government of Canada website**

**Alberta’s Influenza Pandemic Plan (2014)**

**British Columbia’s Influenza Pandemic Plan (2014)**

**Manitoba’s Influenza Pandemic Plan**

**Newfoundland’s Pandemic Plan (2007)**

**New Brunswick’s Influenza Pandemic Plan (2006)**
[https://www2.qnb.ca/content/dam/gnb/Departments/ps-sp/pdf/emo/Pandemic_Planning-e.pdf](https://www2.qnb.ca/content/dam/gnb/Departments/ps-sp/pdf/emo/Pandemic_Planning-e.pdf)
None of the provincial or federal governments fully utilized the recommendations contained in those existing plans.

The COVID-19 pandemic response was flawed from the very beginning in the following ways:

- The responses did not take into account the emergency pandemic plans that had already been created;

- The overall goal of the pandemic response was incorrect. The stated goal was to “protect the healthcare system.” A more appropriate goal should have been to minimize the impact of the virus/disease on all of society.

- The government did not utilize the preexisting emergency response apparatus that existed at all levels of government. Each province and territory had professional people trained in planning for implementing and monitoring an integrated response to any and all emergency situations.
• All emergency responses in Canada are to be under the direct control and supervision of elected officials. During the COVID-19 pandemic, control and authority of all aspects of Canadian society were handed over to non-elected bureaucrats within the healthcare area. These individuals were not elected, and had no substantive actual training in coordinating a response to an emergency situation.

• Fear and terror were used to control the population.

• The government representatives did not express confidence in their plan, nor did they express an overall plan to the population.

• No new surge capacity was constructed within the medical system, and the government took steps to eliminate normal services in order to free up resources. This resulted in lack of medical services for the overall population, including cancellation of care, diagnosis, and treatment of disease and injuries.

• A major planning mistake was bringing people infected with COVID-19 into existing hospitals, thereby potentially infecting the entire facility and staff. If COVID-19 had indeed been the deadly pathogen that we were told, separate treatment centres should have been set up to isolate COVID patients from the existing system that was needed to provide general healthcare.

• The sharing of resources across jurisdictions is a normal function during emergencies, but this practice was discouraged and demonized during the COVID-19 pandemic. The media used any hint of this to make the case that the healthcare system was overwhelmed.

• The government appeared to be unaware of what was going on in the healthcare system and in society overall. The measures that had initially been implemented were not adjusted based on the actual situation being experienced on the ground. An example of this might be that although it was understood as early as March of 2020 that different population groups had different levels of risk and outcomes from COVID-19, resources were expended needlessly in groups that had little or no risk from dying of COVID-19.

• Pandemics are “public emergencies,” not “public health emergencies.” The Premier of every province should have established a task force made up of major public sector ministries to lead, coordinate, and support the efforts. In no instance should public health have been put in the lead of the emergency plan and its overall execution across the entire society. The coordinating agency EMO (emergency measures organization) should have been in charge of the entire response across all societal sectors, this would have guaranteed a balanced and considered response.

• Those who developed and implemented the government response did not fully understand the economic and social impacts of the mitigative measures and attempted to minimize these impacts.
• Continuity of all services and businesses should have been a priority, with assistance being provided to those areas which were actually prevented from accomplishing their tasks.

• No considerations were given to the protection of individual rights and freedoms.

• Government and public health messaging failed to address and manage fear, and instead stoked and inflamed it.

• A realistic cost–benefit analysis was never carried out for each of the measures undertaken so that all effects of the proposed measures could be analyzed.

• Non-pharmaceutical interventions had previously been studied and most were determined to be non-effective; however, they were implemented without consideration of previous experience or reasons given for why they would be appropriate for this particular pandemic.

• No written plans were ever issued by the government or the media to the public so that citizens could make informed decisions.

• Government and media collaborated to promote a certain narrative without consideration of the actual known facts and information.

• Both the government and media developed a narrative which demonized persons who had tested positive for COVID-19 and/or were demonstrating symptoms of COVID-19.

• A recovery plan was never developed or implemented to address the widespread damage that had been done to Canadian society.

• Seventy-three per cent of all reported COVID-19 deaths occurred in long-term-care facilities. This is a controlled and contained population which should have effectively been addressed in a focused way.

• Medical professionals, who were asked during their testimony, had no training or awareness of any pre-existing influenza pandemic plan.

Conclusions

The Canadian response to the COVID-19 pandemic failed in all major areas of emergency response management.

Emergency response was put in the hands of unelected health officers, and elected officials abrogated their legislated responsibilities.

Emergency response planning and implementation must be carried out from the bottom up, since the circumstances of any emergency vary based on actual conditions on the ground.

Federal authorities implemented emergency plans across the country, as opposed to only providing support to local emergency plans.
Despite the existence of detailed pandemic response plans, the government response to the COVID-19 pandemic ignored most of these pandemic response plans.

Existing emergency measures personnel and procedures were not utilized during the pandemic.

The government pandemic plan did not evaluate the overall collateral effects of the measures implemented.

The pandemic measures imposed by government did not take into account the evolving situation.

**Recommendations**

Based on the totality of the witness testimony, the following recommendations are presented:

A. **Emergency measures organizations** (EMOs) must be in charge of planning, implementation, and recovery from any and all “emergencies.”

B. **Public health officials** should never be put in charge of emergency response. They should be a critical component of the planning but should never be charged with running a response.

C. **Emergency Management Act** powers must supersede the powers of the various public health officers. The public health officers must come under the authority of the emergency management agencies.

D. **Elected officials** must remain in charge of all emergency measures.

E. **Follow existing emergency plans.**

F. **Make sure all emergency plans** are publicized and the contents well known by stakeholders in all affected areas.

G. **Require mandatory training** of emergency response personnel.

H. **Follow all emergency measures** legislation in each jurisdiction.

I. **Emergency planning** must be driven from the bottom up.

J. **Federal government should not** be leading emergency response. They should be limited to supporting the requirements of the local authorities.

K. **Media and government cannot be allowed to collude** to present a pre-approved information campaign.

L. **The consultation process** should involve the public, and the comprehensive plan to tackle the pandemic emergency should be regularly, consistently, and promptly communicated to the public.
M. **In any future emergencies**, the government should focus on mitigating public fear and anxiety rather than resorting to fear and terror as a means to secure compliance.

N. **Require mandatory cost-benefit analysis** of any and all emergency measures considered and/or imposed.

O. **Require transparency in decision-making.**

P. **Support open public discourse**, without censorship.

Q. **Require a mandatory recovery plan** to fix the collateral damage done by the pandemic measures.

R. **Require a mitigation plan** for all societal damage done by the pandemic measures.

S. **Establish regulations to ensure** that the elected officials are never sidelined or abrogate their powers to unelected bureaucrats.

T. **Commission an independent study** which is required to include members of the emergency measure organizations from across Canada.

U. **Rebuild emergency response** organizations across Canada.
7.1.9. COVID-19 Pandemic Mandates in the Workplace

Introduction

Many of the witnesses described how their employers, including both government and private industry employers, mandated certain “public health measures” during the pandemic.

These measures included such things as:

- Mandated vaccines
- Face masks
- Social distancing
- Work from home

A number of these industries may have been regulated by the federal government, such as railways or airlines, but many businesses were not.

The Canadian government mandated COVID-19 vaccines for all federally regulated employees and travellers on October 30, 2021.

A list of the departments and industries affected can be found in schedules I and IV. See links below:

Schedule I

Schedule IV

According to the Government of Canada, this order included approximately 267,000 employees.

Provincial and territorial governments also enacted similar requirements for their employees. The timelines for implementation varied by jurisdiction, as did the scope of the mandates.

Within the provincial and territorial jurisdictions there was a mixture of requirements ranging from mandatory vaccinations to required COVID-19 testing.

Witness statements indicated that many employers, both public and private, enacted face masking, social distancing, and work-from-home programs as early as March of 2020. Compulsory COVID-19 genetic vaccine requirements were generally put in place in the fall of 2021, and they were maintained for approximately one year.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Testimony Concerning COVID-19 Mandates in the Workplace
Private companies unilaterally imposed mandates on workers outside of their existing labour contracts, based on a wholesale adoption of the Government of Canada’s or Provincial or Territorial health directives.

Most workers complied with the face masking, social distancing, and work-from-home programs.

Witness testimony primarily focused on those workers who refused to comply with the mandatory vaccine regulations.

Testimony indicated that when a worker refused to take the mandated vaccines, they were dismissed either for cause or for, in many instances, insubordination. Many were put on extended indefinite leave without pay, and were thus denied the ability to receive employment insurance benefits.

Being placed on leave without pay for non-compliance with a unilaterally imposed change in employment conditions is normally considered “constructive dismissal.” It is unclear how the actions of these employers has not been defined as constructive dismissal.

On the Government of Canada website, the definition of constructive dismissal is provided.

According to the Government of Canada:

The phrase “constructive dismissal” describes situations where the employer has not directly fired the employee. Rather the employer has failed to comply with the contract of employment in a major respect, unilaterally changed the terms of employment, or expressed a settled intention to do either, thus forcing the employee to quit. Constructive dismissal is sometimes called “disguised dismissal” or “quitting with cause” because it often occurs in situations where the employee is offered the alternative of leaving or of submitting to a unilateral and substantial alteration of a fundamental term or condition of his/her employment. Whether or not there has been a constructive dismissal is based on an objective view of the employer’s conduct and not merely on the employee’s perception of the situation.

It is the employer’s failure to meet its contractual obligations that distinguishes a constructive dismissal from an ordinary resignation. The seriousness of the employer’s failure as well as the amount of deliberation apparent in its actions are also important factors.
The employer’s action must be unilateral, which means that it must have been done without the consent of the employee. If it is not unilateral, the variation is not a constructive dismissal but merely an agreed change to the contract of employment. Generally, if the employee clearly indicates non-acceptance of the new conditions of employment to the employer, there has been a constructive dismissal only if the employee leaves within a reasonable (usually short) period of time. By not resigning, the employee indicates his/her acceptance of the new conditions of employment.

Many witnesses described how they asked their labour unions to intercede on their behalf and that the unions would not take up the cases of their union members who were laid off, fired, or constructively dismissed.

Unionized workers had no access to individual review by human rights agencies due to their pre-existing union agreements.

Witnesses described how they attempted to get exemptions to the mandates, based on medical or religious beliefs, and that in most instances their requests were denied.

Many of the witnesses who testified before the Commission were unsuccessful in actions against their employers based on constructive dismissal. Although the definition noted above is from the federal government and is based on the provisions of the Canada Labour Code, similar such provisions exist in the provinces and territories throughout Canada.

Workers who had legitimate concerns about the COVID-19 genetic vaccines were faced with a limited set of devastating choices, if they were to stand true to their own convictions. These choices included being terminated, early retirement, forced retirement, or voluntary resignation.

Scarlett Martyn
Impact of Vaccine Mandates

Scarlett Martyn was an advanced care paramedic with special training in disaster response (Heavy Urban Disaster Team). She was first suspended and then terminated for “willful misconduct and jeopardizing workplace health and safety,” after 24 years of service. This was based on her refusal to be vaccinated for COVID-19. She had evidence that confirmed she had natural immunity to COVID-19 and did not require an injection.

Ms. Martyn described a toxic work environment within the health service after the vaccines became available. This toxic environment extended to health care workers within the system and toward patients who were seeking service.

The impact of the vaccine mandates on the readiness and capacity of the Canadian Armed Forces was discussed by Catherine Christensen during her testimony.

Catherine Christensen
Canadian Military Decimated
Ms. Christensen testified that the Canadian Armed Forces lost an estimated 3000 to 5000 personnel due to the mandatory vaccination policy, out of a regular force of 68,000. This was the highest loss of personnel since World War II.

Ms. Christensen stated that the cost to the Canadian Armed Forces exceeded $3 billion in loss of training, experience, and expertise. This did not include costs to the members.

She further discussed the toxic environment that was promoted and created within the Canadian Armed Forces against the unvaccinated, which she claimed continued.

**Laurier Mantil**
Balancing Pregnancy and Safety

When her employer instituted a vaccine mandate in the fall of 2021, she was pregnant, so she did not want to get the vaccine. She applied for an exemption on the basis of human rights. She did not get laid off for non-compliance, as prior to the employer-ruling, she went on maternity leave. Her other co-workers who did not comply were terminated.

**Camille Mitchell**
Pharmacist Camille Mitchell’s Testimony on Vaccine Mandates in Healthcare

Based on her 26-year experience as a pharmacist, she had decided she did not want to take the vaccine. At the time of the vaccine mandates, she was working in the hospital pharmacy. Due to her refusal to get vaccinated, she was terminated from her hospital position, which she held for nine years. Prior to being terminated, she applied for an exemption under a declaration of faith. The employer did not acknowledge the declaration of faith.

Although she found new employment at a community pharmacy, she had to re-certify to administer injections, and she believed testifying before the Commission put her employment at risk under Bill 36.

**Zoran Boskovic**
Lost Job Due to Vaccine Mandates

He was working for the provincial government as a forester at the time of the COVID-19 vaccine mandates. He had been infected with and recovered from COVID-19 in the summer of 2021. His employer brought in a mandatory COVID-19 vaccine policy in the fall of 2021. Both he and his wife applied for a medical exemption due to previous infection and natural immunity. His application was denied.

He was put on three months leave without pay, and then he was terminated. He was terminated by the province on the same day that the federal government removed their vaccine mandate for federal workers.
He was denied employment insurance benefits. He took early retirement after being terminated, and his pension benefits are at a reduced rate.

**Dr. Ben Sutherland**  
Lost his Position at Fisheries and Oceans Due to Non-Compliance with Vaccine Mandates

Dr. Sutherland was a research scientist at the department of Fisheries and Oceans. During much of the pandemic, he was working from home. He had a medical condition and asked if the vaccines had been tested on people with his condition. It had not been tested. He tried to get an exemption from the vaccine mandate from his doctor, based on his pre-existing condition, but was denied.

He tried to get support from his union, but the union would not support him.

He was terminated on November 15, 2021. There were some issues surrounding the termination; the employer told him he was suspended without pay, but on his record of employment was code M. He was able to get employment insurance.

According the Government of Canada website:

**Code M—Dismissal or suspension**

Use Code M when the employer initiates the separation from employment for any reason other than layoff or mandatory retirement (that is, the employee is leaving the workplace because he or she has been dismissed by the employer). Also use this code when the employee is suspended from their employment.

**James Jones**  
Vaccine Mandates, Workplace Bullying and Wife Suicide

Mr. Jones’ wife was subject to a vaccine mandate at BC Transit. The mandate was not imposed by government regulation, but a vaccine mandate was adopted by company management. His wife did not want to take the vaccine because they were wanting to get pregnant. Mr. Jones and his wife had done research on potential side effects due to the vaccines and had serious concerns.

They attempted to apply for an exemption to the mandatory vaccine, based on their concerns with safety. His wife was bullied and coerced from all sides at her work, including from her union, which would not support her.

Eleven days after being terminated from BC Transit for not complying with the vaccine mandate, she took her own life.

**Philip Davidson**  
BC Public Service Employee Testimony on Job Loss Due to Vaccine Mandate

Philip Davidson worked for 14 years in the BC Public Service, in various policy positions. Once the pandemic was declared, many of the staff in their office worked from home.
In the summer of 2021, there was a lot of talk in the office about requiring vaccine passports (BC Vaccine Card). This was implemented on September 13, 2021.

The BC provincial government implemented a requirement for all persons to be vaccinated to enter the BC Legislature.

Mr. Davidson had serious concerns about having to disclose his private health and vaccine status. He said the BC ministry’s communicable disease prevention plan (October 4, 2021) stated that the ministry could not inquire as to vaccine status. Despite this, the BC Public Service issued a policy that required disclosure of vaccine status.

He refused to disclose his vaccination status and was terminated for cause.

Employees who were terminated started a support group, in order to advocate on behalf of the employees. He estimated approximately 2000 to 3000 people were either terminated or took early retirement due to the vaccine mandate.

**Darcy Harsch**

Job Loss and Medical History Testimony on Vaccine Hesitancy and Employment

At the time of the pandemic, Darcy Harsch was working with adults with disabilities. Prior to the pandemic, he had a stroke and was disabled. As a result, he did not want to take an experimental vaccine.

He observed vaccine side effects in his co-workers, which contributed to his concern.

His workplace required him to reveal vaccine status, and he refused, so he was put on unpaid leave for approximately one year. His employer told him that he was not eligible for employment insurance, so he did not apply for employment insurance until the fall of 2022.

**Suzanne Brauti**

Job Loss Due to Denied Religious Exemption Request

She was working for the Government of Canada, in 2019. When the pandemic occurred, she was still in training. Due to the pandemic, she completed her training at home, and then worked at home for approximately one year.

The federal government implemented a vaccine mandate in the fall of 2021. She submitted a request for an accommodation due to religious beliefs. She had filed all the information requested but was denied her accommodation and was put on leave without pay.

She sent in a freedom-of-information request concerning how the government decided to deny her request. She felt that the information showed that she was not fairly assessed and filed a human rights complaint.

She has not been supported by her union.
Grace Neustaedter
Early Retirement: A Nurse’s Testimony on Vaccine Pressure in the Workplace

Grace Neustaedter worked as a nurse for 41 years and has a master’s degree in nursing, working as a specialist in the area of women’s health.

Based on her experience as a nurse, she had serious concerns with regard to the speed that the vaccines were being developed, and she had done significant research into the vaccine’s safety. She tried to have discussions concerning the vaccine safety, but co-workers were extremely close-minded. In fact, staff were vocally criticizing unvaccinated patients in public.

When vaccine mandates were imposed, she applied for a religious exemption, and there was no response.

She spoke to her union and was told that only one religious exemption had been allowed.

Some staff were allowed to continue to work from home, but she was not.

She went on stress leave and then medical leave, and finally she took early retirement.

In addition to employment issues, she and her husband were shunned by friends, family, and her family doctor.

She testified that she did not know anyone who had died from COVID-19 but that she knew several people who died from the vaccine.

Sierra Rotchford
A Paramedic’s Account of Emergency Calls and Mandate-Impact on Ambulance Services

Sierra Rotchford primarily discussed the overall impact of mandates on the ambulance service. She indicated that 35-40 ambulances were taken out of service due to staffing losses. Staff were absent due to termination, stress leave, and illness.

She had sepsis and tried to obtain an exemption from getting the COVID-19 injection but was denied.

She observed a great deal of bullying between colleagues and between medical staff and patients.

She reported that the greatest increase in ambulance calls occurred following the vaccination program.

Vonnie Allen
Emotional Testimony from Veteran Nurse Once a Hero, Now Shamed and Muzzled

After 34 years working as a nurse on the maternity unit, Vonnie Allen was terminated after refusing to comply with the vaccine mandates.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Ms. Allen was denied service, restricted from speaking, and was not allowed to attend when her daughter was hospitalized.

**Cathy Careen**  
Teacher Terminated from her Job

At the time when the pandemic was announced, she was working full-time as a teaching and learning assistant (TLA).

In 2006, she was diagnosed with Guillain-Barré syndrome. As a result, she did not want to take the COVID-19 genetic vaccine, as it had not been tested on patients suffering with her condition.

When the vaccine mandates were announced, she refused to take the vaccine due to her pre-existing condition. Her neurologist wrote a letter saying she should not take the vaccine.

Her request for exemption was denied. She appealed to the union, but they did not support her.

She was denied employment insurance benefits.

**International Human Rights Law**  
**Gail Davidson**  
Canada’s Obligations Under International Human Rights Law

Ms. Davidson was a retired lawyer who had worked 20 years as an expert in international human rights law.

Canada had obligations under international human rights law. Many of these laws were violated by the mandates imposed in Canada during the declaration of the COVID-19 pandemic.

Right to Informed Consent was violated.

Certain international laws to which Canada was a signatory cannot be suspended, but they were suspended.

Her opinion was that the restrictions of rights of employees were in violation of international human rights laws.

**Conclusions**  
A variety of COVID-19 mandates were unilaterally imposed on workers in all levels of government and in a variety of private industries across Canada.

Generally speaking, most non-pharmaceutical measures imposed at the workplace were complied with by employees; however, the imposition of compulsory vaccine mandates was resisted by many workers.
Resistance to mandatory vaccines resulted in a significant loss of qualified workers in all industry sectors. The loss of workers was due to suspensions, dismissals, forced retirements, voluntary early retirements, or worker resignations.

Many workers who were suspended, terminated, or dismissed were deprived of any assistance from the employment insurance plan due to the way their dismissals were coded.

Testimony received, indicated that the imposition of a mandatory vaccine was in direct contradiction to the principle of Informed Consent, which is a cornerstone of modern medicine.

Very few exemptions were provided to employees who had medical conditions, religious objections, or were concerned with taking an experimental gene therapy.

Despite the viable option of working from home, many employees were denied this option.

Shortages of staff resulted in reduced patient care due to the mandates implemented in the medical field.

Unions did not support the objections of their members to mandatory vaccines, and due to the union agreements, these workers were denied the right to appeal their layoff decisions.

The imposition of mandatory vaccines, in addition to the breach of medical privacy, resulted in toxic work environments which extended not only to staff working in facilities but also to the public accessing these services.

The mandates violated international human rights laws, to which Canada was a signatory. Rights to health include:

- Informed Consent,
- Freedom from Coercion, and
- Freedom from Experimentation.

The mandates that were imposed on Canadians violated many of the existing protected rights that are granted and recognized by both Canadian law and international laws and agreements, to which Canada has obligations.

In addition, Canada has certain obligations under international law, and there are certain rights that can be limited, under certain conditions, and there are other right that are absolute, which cannot be restricted.

Testimony of the witnesses provided examples of government actions which violated certain rights which were absolute rights, and therefore, the actions of the government were not in accordance with Canada’s obligations under international law.
The Commissioners heard evidence that under international law, absolute rights cannot be violated, even under emergency situations.

Examples of absolute rights include:

**International Treaty Rights**

These include the right to: life; freedom of belief, conscience and religion; freedom from coercion to adopt a belief other than by choice; freedom from torture and ill treatment, the right to freedom from experimentation; freedom from ex post facto laws; and effective remedies for violations.

**Jurisprudence Rights**

These include the right to education, work, health, Informed Consent, and freedom from coercion.

The actions taken by the government were not in accordance with international laws and treaties to which Canada was a signatory.

Generally speaking, the laws that set out the legal limitation of the government’s actions in Canada were well established and should have been sufficient to prevent the imposition of mandates on unwilling people through threats or coercion.

The violation of essential human rights came about from the wilful violation of those laws by both state and private actors.

A further issue in Canada is the financial reality of enforcing citizens’ rights against government entities or large corporate entities. Governments or large corporate entities have virtually unlimited financial resources and can simply exhaust the financial resources of most private citizens.

Add to this the doctrines of “judicial notice” or “mootness.” These doctrines effectively eliminate the right of citizens to their day in court. Canada is required to uphold the principle of the rule of law, which is necessary to protect the rights of citizens.

The rule of law requires that laws be properly purposed, properly passed, equally applied to all, and that there be measures in place to ensure equality, accountability, and access to all citizens. This is sadly not the case in Canada.

**Recommendations**

We recommend the following:

A. **Immediate development of a judicial panel**, overseen by citizens, with the responsibility to investigate the human rights violations that were committed by both governments and private corporations during the pandemic.
B. **Develop and implement** a constitutional and international law education course for all judiciary positions across Canada. The intent is to educate judges and Crown attorneys as to their responsibilities under the constitution and international treaties to which Canada is a signatory nation.

C. **Carry out immediate judicial reviews** of all pandemic-related court cases that were denied on the basis of mootness or judicial notice.
7.1.10. Policing During COVID-19 Pandemic: Balancing Authority and Citizens’ Rights

Introduction
The role of law enforcement agencies in Canada is firmly rooted in the principles of maintaining public safety, upholding the rule of law, and safeguarding the fundamental rights and freedoms of its citizens.

Policing at various levels of government, from federal to provincial to municipal, forms a critical part of Canada’s social fabric. Yet, as the nation grappled with the unprecedented challenges posed by the COVID-19 pandemic, the actions of law enforcement agencies came under heightened scrutiny.

It is critical to understand the role and intent of the police in Canada, emphasizing what they are meant to do and what falls outside the scope of their duties. While the police are entrusted with maintaining order, their authority is carefully controlled by the principles of democracy and respect for individual rights.

Many witnesses described actions of the police to enforce government mandates during the COVID-19 pandemic that may have encroached upon the basic and fundamental rights of Canadian citizens. These actions included forced closures of businesses, arrests of citizens, the forceful breakup of peaceful protests, and the arrest and imprisonment of members of the clergy.

Canadians must assess whether law enforcement agencies in Canada have struck the right balance between protecting public health and respecting the constitutional rights and civil liberties of Canadian people during these extraordinary times.

Witnesses described specific cases and events that have garnered attention, weighing the considerations of public safety, individual freedoms, and the rule of law.

In a country that takes pride in its commitment to democracy and human rights, it is essential to critically evaluate the actions of the police in the context of the COVID-19 pandemic and reflect upon the broader implications for Canadian society. By engaging in this dialogue, we seek to promote a deeper understanding of the challenges faced by law enforcement and the rights of citizens, ultimately contributing to a more informed and just society.

Testimony of Witnesses
Witnesses who testified concerning the actions of the police include the following:

Chief John Greg Burke
Chief Burke described how he was assaulted by store employees for not wearing a face mask, despite his having a medical exemption from wearing a mask. When the police were called, they allegedly assaulted Chief Burke and arrested him. Chief Burke had interactions with both Bedford Police and RCMP.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Tom Marazzo
Mr. Marazzo described his interactions with the police while attending the truckers’ protest in Ottawa, which included the alleged assault of a disabled war veteran.

Natasha Petite
Ms. Petite testified that due to a disability, she was not able to wear a mask. She testified how when she and her mother were shopping, police were called and she was pushed to the ground by police and arrested.

Vincent Gircys
Mr. Gircys was a retired 32-year veteran of the Ontario Provincial Police. He attended the Ottawa truckers’ protest, where he acted as a liaison between the protestors and the police. Mr. Gircys testified that the police had committed alleged crimes against various churches. Mr. Gircys also testified that the police services refused to investigate alleged crimes related to the vaccines.

Tobias Tissen
Mr. Tissen ministered a church in southern Manitoba during the COVID-19 lockdowns. His church was closed down by the RCMP and he was arrested for keeping his church open during the pandemic.

Richard Abbot
Mr. Abbot was an Edmonton police officer for 25 years. He discussed his experiences and observations of the police actions during the protest in Coutts, Alberta.

David Leis
Mr. Leis testified regarding the failure of Canadian institutions to protect the civil rights of Canadians.

Danny Bulford
Mr. Bulford retired after a 15-year career with the RCMP. He spoke about the actions of the RCMP during the protests. He further spoke about a police detective who was disciplined for launching an investigation into suspicious infant deaths potentially related to the vaccines.

Pastor James Coates
Pastor Coates testified how his church services were disrupted by the police and he was arrested and jailed for keeping his church open during the lockdowns.

Discussion of Police Actions
Testimony of the witnesses suggested that the police took actions to enforce mandates and rulings that were contrary to section 52.1 of the Canadian Constitution, which included the Canadian Charter of Rights and Freedoms.
Section 52(1) of the Constitution states:

52.(1) The Constitution of Canada is the supreme law of Canada, and any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect.

Lockdowns, forced vaccinations, restrictions of travel, interruption of church services, and assaults on peaceful protestors are all actions which appear to be inconsistent with the Canadian Charter of Rights and Freedoms and/or the Criminal Code of Canada.

Citizens’ fundamental rights were violated under the guise of a public health emergency, despite the government not having to prove the validity of that public health emergency within an objective and independent inquiry, or through open and honest debate.

Only one narrative was permitted and any dissenting options were censored and vilified by the media and public officials.

Testimony was provided on how significantly people’s lives were affected, which included death due to the mandates, allegedly through increases in suicides or credible allegations concerning an unsafe medical procedure being forced upon citizens.

Testimony showed that information provided to the public by the government and the media misled the people and, in so doing, may have contributed to deaths.

Witnesses testified that they were allegedly forced to take medical procedures under threat of loss of employment. It may be reasonable to believe that the actions taken to have people take injections against their will could be considered a Criminal Code violation.

Forcibly subjecting a person to unwanted medical treatment in Canada can potentially violate several provisions of the Criminal Code of Canada, depending on the circumstances and the severity of the actions involved. Here are some relevant sections of the Criminal Code that may apply:

- Assault (section 265): Forcing someone to undergo medical treatment against their will may constitute assault under the Criminal Code. Assault includes not only causing bodily harm but also the intentional application of force without consent.

- Aggravated Assault (section 268): If the forced medical treatment results in severe bodily harm or endangers the life of the victim, it may be charged as aggravated assault, which carries more severe penalties.

- Kidnapping (section 279): If the victim is forcibly taken to a medical facility or detained against their will for medical treatment, it could be considered kidnapping under certain circumstances.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

- Uttering Threats (section 264.1): Threatening someone with harm or injury if they refuse medical treatment may lead to charges of uttering threats.

- Unlawful Confinement (section 279): If a person is forcibly confined to a medical facility or prevented from leaving against their will for medical treatment, this may be treated as unlawful confinement.

- Mischief (section 430): Interfering with or damaging medical equipment or property related to medical treatment may fall under the offence of mischief.

Consent is a crucial factor in medical treatment in Canada, and any medical procedure performed without Informed and Voluntary Consent can lead to criminal charges.

However, specific charges and penalties will depend on the circumstances and the evidence available. Legal authorities will thoroughly investigate and assess each case to determine the appropriate charges.

The police failed to take action and investigate credible allegations of criminal wrongdoings, despite being presented with evidence of such alleged wrongdoings by multiple sources throughout Canada.

Witness testimony indicated that frontline police officers could initiate a criminal investigation on their own and that an investigation of any alleged criminal actions related to the pandemic measures and police actions must have been authorized by senior administrative staff.

Testimony confirmed that in a number of instances when police officers took action to investigate allegations of misconduct, these officers were disciplined.

The actions of the police services at the various peaceful protests sites, but most notably the Ottawa protest, indicated that the police were being given erroneous information concerning the nature and threat posed by the protestors. Witness testimony described how the protestors were exercising their rights to peaceful protest and that the character and the nature of the protestors was readily evident. Despite this, the police frontline members were replaced by members who had not been in direct contact with the protestors. These replacement members allegedly acted in a completely inappropriate manner using excessive force and violence on an unarmed and peaceful crowd of Canadian citizens.

The area where the Ottawa protests took place, in front of Canada’s Parliament, was monitored by numerous video cameras, so there are likely a great number of recorded videos available which recorded both the actions of protestors and the police. This video record is critical to any investigation into the alleged misconduct of the police. As yet, this video record has not been presented to the public, and we do not know if it is being used in any criminal investigations of the police conduct.
Police officers are not robots; they are human beings entrusted with a crucial role in upholding the law and ensuring public safety. In performing their duties, officers are not merely expected to blindly follow orders but, rather, to employ their judgment and analytical skills. They must assess the legality and appropriateness of the orders they receive, all while considering the specific circumstances unfolding before them. Importantly, officers have a solemn duty not to enforce any orders that are illegal or in violation of fundamental rights. This obligation to act appropriately, guided by the reality of the situation on the ground, underscores the importance of independent decision-making within the framework of the law and serves as a cornerstone of democratic policing in free and just societies.

It is unknown whether any internal investigations of police actions have been undertaken, despite the level of alleged violence perpetrated by the police on the civilian population.

The Commission heard testimony that the police services were experiencing internal struggles with the implementation of the mandates on their own members and that unions representing members were not defending the member’s rights. This allegedly resulted in low morale and a removal of many experienced officers from the ranks at a time when the services were already experiencing staff shortages and morale issues.

Conclusions
In conclusion, the role of law enforcement agencies in Canada is deeply rooted in the principles of safeguarding public safety, upholding the rule of law, and protecting the rights and freedoms of Canadian citizens. The imposition of the various COVID-19 pandemic mandates posed unprecedented challenges, which brought the actions of these agencies into focus. It is essential to comprehend the intended role of the police in Canada, emphasizing their duty to maintain order within the boundaries of democracy and individual rights.

During the pandemic, police actions came under scrutiny, particularly in cases where they may have infringed upon the fundamental rights of citizens. This scrutiny encompassed instances such as forced business closures, citizen arrests, the dispersion of peaceful protests, and even the arrest and incarceration of clergy members. Canadians must carefully evaluate whether law enforcement agencies effectively balanced public health concerns with constitutional rights.

The witnesses’ testimonies shed light on specific incidents where actions taken by the police seemed inconsistent with section 52(1) of the Canadian Constitution, which incorporates the Canadian Charter of Rights and Freedoms. The fundamental rights of citizens appeared to be violated under the pretext of a public health emergency, raising questions about the validity of these measures without objective inquiry or open debate.

The impacts on people’s lives, including alleged harm and death, underscore the gravity of these issues. The testimonies also pointed to potential misinformation contributing to public perceptions and deaths. Additionally, there were allegations of coercive measures, potentially constituting criminal offences.
Frontline police officers faced challenges in investigating these allegations due to the need for authorization from senior administrative staff, and instances of officers facing discipline for initiating such investigations were reported. The response to peaceful protests, particularly in Ottawa, raised concerns about police actions and the accuracy of information provided to officers.

In assessing the actions of law enforcement during the pandemic, it is crucial to remember that police officers are human beings entrusted with the duty to uphold the law and protect the public. They are not automatons but individuals who must analyze orders critically and consider the prevailing circumstances. They bear the responsibility of refusing to enforce illegal or rights-violating orders. Independent decision-making within the framework of the law is foundational to democratic policing.

The situation also raised concerns about internal struggles within police services that affected morale and staffing levels. These issues are complex and multifaceted, warranting ongoing dialogue, investigation, and reflection to ensure that the actions of law enforcement agencies align with the values of democracy and justice in Canadian society. By engaging in this discourse, we strive for a deeper understanding of these challenges, ultimately contributing to a more informed and equitable society.

Recommendations
A. **Independent Judicial Investigations**: Conduct independent and transparent judicial investigations into allegations of illegal activities by law enforcement officers during the pandemic, ensuring accountability and adherence to the rule of law. This investigation must have the power to enforce subpoenas to obtain witness testimony and critical documents.

B. **Review and Revise Policing Protocols**: Collaborate with law enforcement agencies to review and revise their protocols and guidelines for enforcing government mandates, with a focus on respecting individual rights and freedoms while safeguarding public health.

C. **Enhance Training and Education**: Provide comprehensive training on handling public health crises to law enforcement officers, emphasizing respect for human rights, de-escalation techniques, and community engagement.

D. **Public Awareness Campaigns**: Launch public awareness campaigns to educate citizens about their rights and responsibilities during health emergencies, promoting dialogue and cooperation between the police and the community.

E. **Community Policing Initiatives**: Promote community policing initiatives that foster positive relationships between law enforcement agencies and the communities they serve, enhancing trust and cooperation.

F. **Clear Accountability Mechanisms**: Establish clear mechanisms for holding law enforcement agencies accountable for their actions during the pandemic, ensuring transparency and fairness in the disciplinary process.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

G. **Civilian Oversight**: Strengthen civilian oversight bodies to independently monitor police conduct during public health crises, ensuring adherence to legal and ethical standards.

H. **Regular Reporting and Transparency**: Mandate law enforcement agencies to regularly report on their activities during health emergencies, providing transparency and accountability to the public, while respecting privacy and security concerns.

By implementing these recommendations, authorities can strike a balance between maintaining public safety during health crises and upholding the fundamental rights and freedoms of citizens, ensuring a more just and equitable response to future pandemics.
7.2. Social Impacts

7.2.1. Neglect and Isolation of Seniors in Canada Amidst COVID-19 Interventions

Introduction
The interventions put in place by the various levels of government and by various “independent” service providers in Canada during the COVID-19 pandemic have destroyed and ended lives across every segment of Canadian society, profoundly impacting every age group. However, one of the most vulnerable populations affected by the mandates in Canada has been seniors.

As Canada implemented both pharmaceutical and non-pharmaceutical based measures such as “vaccines,” social distancing, and lockdowns, significant consequences as a result of these interventions quickly emerged. Among these consequences, the neglect and isolation of seniors have become prominent issues. This section explores the devastating effects of COVID-19 measures on Canadian seniors.

Testimony of Witnesses Detailing Neglect and Isolation of Seniors
Based on the testimony of witnesses, it was obvious that the various government agencies, private corporations, and citizens in general knew very early on in 2020 exactly who was most at risk from the virus and what focused steps should have been taken to reduce these risks.

Based on decades of experience in the treatment of and care for seniors, these caregivers and regulators must have known what devastating impacts would result from the implementation of the interventions; however, many of these agencies, institutions, and individuals continued to devastate our seniors in an inhuman, profound, and intentional way.

Many stories of unconscionable neglect and cruelty were brought to the Commission hearings.

Testimonies were received from the following witnesses:

Dr. Patrick Phillips (Truro, NS)
Dr. Phillips testified that the hospitals were empty during COVID-19 and that many persons were neglecting their health or were afraid to go to the hospitals for care.

Shelly Hipson (Truro, NS)
Ms. Hipson testified that, based on her freedom-of-information requests she was able to confirm that the hospitals and specifically ICU facilities, were not overwhelmed due to COVID-19.
**Dr. Peter McCullough** (Truro, NS; Virtual Testimony)
Dr. McCullough testified that there were a number of alternative treatments available, as opposed to a COVID-19 experimental vaccine, very early in the pandemic. He further indicated that alternative methods were less risky in seniors than an untested vaccine. Dr. McCullough stated that there was no evidence that a person who had no symptoms of COVID-19 could transmit the illness to anyone else; therefore, the lockdown of healthy people was unnecessary.

**Paula Doiron** (Truro, NS)
Ms. Doiron worked in a nursing home and testified that they were short-staffed and that the situation was chaotic. She further testified that she was not aware of any on-site monitoring carried out by government regulators.

**Janessa Blauvelt** (Truro, NS)
Ms. Blauvelt was a licensed practical nurse (LPN) at the hospital. She left her position because she refused to get the injection. She reported much dissension in the workplace due to injection status.

**Marc Auger** (Toronto, ON)
Mr. Auger’s father was in a long-term-care facility and was locked down in his room for long periods of time. As a result, his father’s dementia got substantially worse.

**Oliver Kennedy** (Toronto, ON)
Mr. Kennedy, a recreational therapist for seniors, was terminated for his refusal to take an injection.

**Richard Lizotte** (Toronto, ON)
Mr. Lizotte’s elderly brother, who was in care, reacted to the injection and was taken to the hospital, where he was isolated and not allowed any visitors. His brother was sent to palliative care and died alone.

**Victoria McGuire** (Toronto, ON)
Ms. McGuire was a registered nurse who stated that during 2020 and 2021, there were very few people in the hospital and that there was a toxic environment in the hospitals due to animosity against the uninjected.

**Leanne Duke** (Toronto, ON)
Ms. Duke’s father had Parkinson’s and dementia, and at the time of the pandemic, her father was in a primary-care home. Prior to the pandemic, she was spending two to three hours a day caring for her father in the facility, as the staff refused to provide the proper care required for his stoma. After the lockdowns, she was barred from entering the facility to care for her father. During the lockdowns, her father could not go to medical appointments. She said that most days during the lockdowns, her father was left in his own waste.
Lynn Kofler (Toronto, ON)  
Ms. Kofler was a registered nurse in a long-term-care facility. She witnessed serious injuries in her unit and stated that there were 34 deaths out of a total of 55 residents. She said the facility was in COVID-19 lockdown, despite there being no cases of COVID-19.

Cindy Campbell (Toronto, ON)  
Ms. Campbell had worked 28 years as a nurse. She testified that due to departmental closures at hospitals, there was an excess of staff. She said that prior to the pandemic, the emergency room resembled a war zone and that during the pandemic, the emergency room was very slow.

Scarlett Martyn (Toronto, ON)  
Ms. Martyn was an advanced-care paramedic who lost her job for refusing to get injected. She reported a toxic atmosphere in the hospitals. She said that at the beginning of 2020, hospitals were empty. Once injections rolled out, there was a wave of “sudden death” calls.

Maureen Somers (Toronto, ON)  
Ms. Somer’s husband was taken to the emergency with abdominal pains. The doctor was only interested in his injection status and would not provide treatment, because he wasn’t vaccinated. A second doctor came in on the next shift and did an emergency appendectomy.

Martha Voth (Winnipeg, MB)  
Ms. Voth’s elderly husband was admitted to hospital with difficulty breathing and shortness of breath. The hospital refused to provide him with O₂ therapy and put him on respirator. He died shortly thereafter.

Sara Martens (Winnipeg, MB)  
Ms. Martens’ elderly husband was in a traffic accident, taken to the hospital, tested for COVID-19, and tested positive. Her husband was in emergency on O₂ but was coherent. Once he tested positive for COVID-19, a nurse said they would not be providing him with treatment. The hospital would not let her speak to the doctor. The hospital intubated him and then placed him on a ventilator. He died shortly thereafter.

Michelle Kucher (Winnipeg, MB)  
At the beginning of 2020, Ms. Kucher was working in Selkirk, Manitoba, in the healthcare field. In 2020, Michelle moved in with her mother to take care of her, following a surgery that her mother had in January 2020. Due to lockdowns and loneliness, she died in 2021.

Angela Taylor (Saskatoon, SK)  
Ms. Taylor was an LPN in a seniors home. She talked about the isolation and loneliness of the residents and how so many of the seniors had simply given up on life and died due to the treatment they received during the lockdowns.
Marjaleena Repo (Saskatoon, SK)
Ms. Repo was an elderly lady who was diagnosed with stage-4 cancer and could not wear a mask. She obtained an exemption but was targeted and victimized by many in the community due to her inability to wear a mask. She was allegedly terribly abused and doxxed by the local radio station.

Jody McPhee (Saskatoon, SK)
In May 2021, Ms. McPhee’s elderly father got an injection. Within 45 minutes, they knew he was dying. He drove himself to the hospital; she was not allowed to see him because she was not on a “list.” Staff said her father died of a reaction to injection.

Dr. Christopher Flowers (Saskatoon, SK)
The takeaway from Dr. Flowers’ testimony was: “Pfizer clinical trials did not include any seniors or people with comorbidities.”

Heather Burgess (Saskatoon, SK)
Heather was a retired nurse with a mother in long-term care due to Alzheimer’s disease. Her mother was locked down for very long periods of time with no activities, and even meals were taken in her room, alone. Her mother was not allowed any visitors and thought that she had been abducted. Her mother was in a constant state of terror and tried to run away three times. Eventually, Ms. Burgess’ mother was injured and died.

Judy Soroka (Red Deer, AB)
Ms. Soroka was a retired nurse with a back injury. Due to lockdowns, she could not get therapy treatment, and her condition deteriorated.

Caroline Hennig (Vancouver, BC)
Ms. Hennig was living in Costa Rica at the time of the pandemic and came to Canada to care for her father, who was in poor condition in a long-term-care facility. Over several months, she nursed him back to health and then returned home. Several months after her departure, he stopped communicating and began to fail; he requested to die under the MAID (medical assistance in dying) program. She believed his decision was due to the neglect and lack of care in the facility.

Zoran Boskovich (Vancouver, BC)
Mr. Boskovich and his wife were forced to take early retirement due to injection mandates. As a result, they will have serious financial shortfalls for the rest of their lives due to reduced pension payouts.
Lynette Tremblay (Québec City, QC)
In 2020, Ms. Tremblay’s father was in a long-term-care home. There were no cases of COVID-19 in the home, but the residents were locked down and isolated anyway. No one could visit, and the residents were locked in isolation. In a phone call with her father, he told her that he had tested positive for COVID-19 but had no symptoms. Police were in attendance at the home to prevent anyone from coming in or out of the facility. According to the testimony, when a patient tested positive for COVID-19, all medications and treatments of the patient were withheld. Her father allegedly died due to neglect and isolation.

Shawn Buckley (Québec City, QC)
Mr. Buckley testified that under the interim order which authorized the use of the COVID-19 injections in Canada, the COVID-19 injections were exempted from providing the safety and efficacy proof that is normally required of any other new drug approved in Canada.

Dr. Denis Rancourt (Québec City, QC; Ottawa, ON; Virtual Testimony)
Dr. Rancourt and his team reviewed the all-cause mortality statistics for Canada, and he stated that there was no increase in all-cause morbidity due to a virus. The increase in deaths coincided with the lockdowns and the rollout of the injections.

Stephanie Foster (Saskatoon, SK)
Ms. Foster’s elderly mother died immediately after being administered the injection at a local pharmacy. Her mother did not want to get the injection but was convinced she had to do it to keep everyone else safe. She said that her mother died immediately after getting the injection, while still in the pharmacy. She further described how no one who was in line for the injection reacted or even left the lineup, they remained in the line, despite what they had seen. No autopsy was performed.

Neglect and Reduced Access to Healthcare
One of the primary concerns for seniors during the pandemic was the neglect they experienced due to a healthcare system which no longer addressed their needs.

The focus on “protecting the healthcare system,” rather than “protecting the public from the disease,” resulted in limited resources for other healthcare needs.

Steps were taken to dismiss healthcare staff who had refused to undertake an experimental medical procedure. Many healthcare professionals simply quit or took early retirement; many were terminated from their positions. No one was spared these actions—from senior first responders to emergency room doctors to nurses and all level of support staff.

Patients in the healthcare system were sent home.

Both patients and healthcare professionals were terrorized by the government and media reports concerning the morbidity and infectious nature of the virus which causes COVID-19. As a result, a cruel and toxic environment developed throughout the healthcare system.
Many members of the public were so terrified that they would not visit the hospital, even in dire situations, and when they did go to the hospital, they were often given very little care. The situation was even worse if these people had not been injected.

The situation was even worse for our seniors.

Routine check-ups, elective surgeries, and non-urgent appointments were postponed or cancelled, leaving seniors grappling with delayed medical care. Consequently, many seniors have had to endure prolonged pain, worsening conditions, and deteriorating mental health, leading to an overall decline in their quality of life.

Moreover, the fear of contracting the virus has deterred seniors from seeking necessary medical attention, resulting in undiagnosed conditions and unaddressed health issues. This fear-induced hesitation had severe consequences, as conditions that could have been easily managed if detected early, progressed to advanced stages. As a result, the neglect of seniors’ healthcare needs exacerbated their overall vulnerability during the pandemic.

When the injections were developed in late 2020, there was no evidence that they were safe to use in the seniors population, given the fragility and multitude of pre-existing conditions in that population. None of the vaccine testing carried out prior to the interim order included specific tests on populations of seniors.

The testing carried out prior to releasing these experimental injections was only on “healthy” persons.

Testing injections on seniors is of paramount importance for several reasons:

- Older adults have a higher risk of severe illness and death due to COVID-19, making them a priority population for injection. Understanding the safety and efficacy of injections in seniors, is essential to protect this vulnerable group from the adverse effects of the virus and adverse effects of any new type of injection.

- Aging is associated with changes in the immune system, which can affect the response to injections. Older adults may have a reduced immune response, making it crucial to determine the effectiveness of injections in this population. Additionally, seniors often have underlying health conditions and may take multiple medications, necessitating thorough testing to ensure injection compatibility and safety.

Despite the lack of testing and the lack of any safety or effectiveness data related to seniors, this population was threatened, coerced, and terrified into taking the injections. Many witnesses indicated that their loved ones died immediately following the injections.
Ensuring the safety and efficacy of COVID-19 genetic vaccines in seniors is crucial for protecting this vulnerable population from severe illness and mortality. Rigorous testing protocols, including clinical trials that specifically included seniors, were never implemented to assess injection safety and effectiveness in this highly vulnerable age group.

**Isolation and Loneliness**

Another critical consequence of COVID-19 non-pharmaceutical measures has been the enforced isolation of seniors.

The unnecessary restrictions on social gatherings, visitation policies in long-term-care homes, and physical distancing guidelines have significantly limited seniors’ interactions with their families, friends, and support systems.

Many seniors who resided alone or in care facilities experienced an overwhelming sense of loneliness and isolation, which had devastating effects on their mental and emotional wellbeing.

Isolation not only leads to increased feelings of loneliness and depression but also contributes to cognitive decline and a higher risk of developing dementia. The absence of regular social interactions and engagement can accelerate the decline of seniors’ cognitive abilities.

Additionally, the total lack of emotional support and companionship left many seniors feeling disconnected from their loved ones and the community, which further exacerbated their sense of isolation.

The detrimental effects of isolation and loneliness on seniors had devastating impacts on the physical, mental, and emotional health including the following:

**Physical Health**

- Isolation and loneliness can have a profound impact on the physical wellbeing of seniors. The Commissioners heard testimony that social isolation increases the risk of various health problems. Seniors who lack social connections are more likely to develop chronic conditions such as cardiovascular diseases, hypertension, and weakened immune systems. Additionally, the lack of social engagement may lead to sedentary lifestyles, contributing to a decline in physical fitness and mobility.

**Mental and Cognitive Decline**

- Loneliness and isolation can have detrimental effects on seniors’ mental and cognitive health. The absence of regular social interaction can increase the risk of depression, anxiety, and cognitive decline. Studies have linked prolonged loneliness to an increased likelihood of developing conditions such as Alzheimer’s disease and other forms of dementia. The absence of stimulating conversations and mental challenges may contribute to a decline in cognitive abilities over time.
Emotional Wellbeing

- Seniors who experience isolation and loneliness often grapple with significant emotional distress. Feelings of sadness, worthlessness, and a lack of purpose can become pervasive. The absence of social connections and meaningful relationships can lead to a diminished sense of self-worth and overall life satisfaction. Emotional wellbeing is closely tied to social interactions, and the lack thereof can have severe consequences for seniors’ mental health.

Quality of Life

- Isolation and loneliness directly impact the overall quality of life for seniors. The absence of social support networks can result in decreased life satisfaction and reduced enjoyment of daily activities. Seniors may feel disconnected from society and deprived of opportunities for engagement and personal growth. As a result, their sense of purpose and fulfillment may diminish, leading to an overall diminished quality of life.

The detrimental effects of isolation and loneliness on seniors cannot be underestimated. Witnesses testified that these effects were recognized and were well known throughout the healthcare community. However, despite this knowledge, healthcare providers wilfully followed the COVID-19 propaganda and engaged in the very activities that they knew would seriously harm or even cause the painful and lonely deaths of the very people they were supposed to be caring for. They knew what they were doing was wrong, but they followed their orders anyway.

How these caregivers were able to so easily dehumanize this vulnerable population is outside of the scope of this report. The Commissioners recommend that investigations be undertaken into the treatment of residents of long-term-care homes and about whether owners, staff, or employees should face liability or consequences where residents were mistreated.

Testimony was received concerning many seniors who simply gave up living as a result of being isolated, not only from their loved ones but by “healthcare” staff and caregivers.

One witness testified that upon returning home from overseas, she found her father, who was in a care facility, near death due to the isolation and neglect. The witness was able to intervene and nurse her father back to life. Once her father was well and once again in good health (due to her care), she had to return to her home overseas. Shortly after, she was informed that her father had requested and been granted a supervised death under the government MAID program.

In her opinion, her father chose to die rather than to face the isolation and neglect that he had previous experienced without the intervention of his daughter.

Testimony was received that many seniors with dementia were simply left alone, locked in their rooms for days and weeks or even months at a time. These patients were simply left to rot and eventually die.
Many of the witnesses, including staff and family were asked if they ever saw any government inspectors on the premises of these facilities, to ensure that the residents were receiving care. All witnesses stated that they were aware of no such in-person inspections by independent outside agencies. The regulators simply turned their backs on what was going on.

It must be noted that a significant part of the problem was the systematic dismissal of any existing care staff who refused to submit to the injections that were mandated by their employers. Some staff were terminated and others simply resigned or retired.

These actions left already understaffed facilities with a critical shortage of trained and experienced care staff. The result further eroded the quality and quantity of care that was being provided.

Oftentimes family and friends were not aware of the dire situation that had developed within the care facilities, because they were also locked out and were not allowed to visit their loved ones.

Phone calls or digital calls were no substitute to seeing what exactly was going on in these facilities, especially considering many seniors were unable to communicate their predicaments.

Financial Struggles and Digital Divide
Outside of care facilities, independent seniors also faced significant financial challenges during the pandemic. Many seniors rely on part-time work or small businesses to supplement their income, and the economic downturn caused by COVID-19 mandates severely impacted their financial stability. Job losses, reduced hours, and closures of businesses left many seniors struggling to make ends meet, leading to heightened stress and anxiety.

Furthermore, the rapid shift to digital communication and online services has highlighted the digital divide among seniors. With limited access to technology and digital literacy, many seniors have struggled to connect with their loved ones, access essential services, and participate in virtual social activities. This exclusion from the digital realm has further deepened their sense of isolation and made it more challenging for them to adapt to the changing landscape brought about by the pandemic mandates.

Conclusion
The neglect and isolation of seniors in Canada due to COVID-19 measures had significant adverse effects on their physical health, mental wellbeing, and overall quality of life.

Addressing the needs of seniors during these challenging times is not only a matter of compassion but also a responsibility society must uphold.

By prioritizing seniors’ healthcare, promoting social connections, addressing financial struggles, and bridging the digital divide, we can ensure that seniors are not forgotten, neglected, or isolated but rather, supported, cared for, and included in the collective response to the pandemic.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Given the profound and inhuman treatment that many seniors in care facilities received, it is imperative that a nonpolitical investigation be carried out to determine if criminal charges should be laid and, if so, against whom.

Speed is of the essence in undertaking this investigation, since, given the fragile nature of the victims, there may not be many of them left to give evidence.

Recommendations

A. **To alleviate the neglect and isolation** faced by seniors, it is crucial for the federal, provincial and territorial governments, communities, and individuals to take proactive steps. First and foremost, healthcare systems should prioritize healthcare needs of seniors, ensuring that seniors have access to essential medical care and support services.

B. **Moreover, efforts should be made to enhance** the social connections of seniors. This can include facilitating safe visitation policies in long-term-care homes, promoting intergenerational programs, and encouraging community organizations to provide support and companionship to isolated seniors. Volunteering initiatives, teleconferencing platforms, and community outreach programs can help bridge the gap between seniors and their support networks.

C. **Financial assistance programs should be expanded** to specifically address the needs of seniors who have been adversely affected by the pandemic mandates. Providing targeted financial support, job training, and re-employment opportunities can help seniors regain their financial stability and alleviate some of the stress they face.

D. **Bridging the digital divide among seniors** should be a priority. Initiatives aimed at enhancing digital literacy and providing seniors with the necessary tools and resources to access online services can empower them to connect with their loved ones, access information, and engage in virtual social activities.

E. **It is imperative that a judicial investigation** be carried out immediately to determine if any criminal wrongdoing was perpetrated on our senior populations during the pandemic. Witness statements from staff, seniors, and family must be immediately obtained and archived, to be used as evidence in any future prosecutions.

F. **An investigation should be conducted** into how the various regulatory agencies abandoned their roles of protectors of seniors and never appeared to visit facilities to check on the operation and level of care being given out.

G. **Those caregivers who simply followed** the orders given to them to isolate and dehumanize our seniors in their care must be re-educated or removed from the system and not allowed to continue to provide “care” to seniors.
H. **Like other professions**, caregivers and administrators working with seniors should be mandated to participate in annual professional development and training programs.
7.2.2. The Effects of Sustained Propaganda and Terror

Introduction
Propaganda can have a profound impact on the masses, shaping public opinion, influencing beliefs, and driving collective behaviours. The pandemic was a textbook case of the collaboration of government and industry to subvert the democratic institutions and convince the citizens of the validity and truthfulness of a narrative that was objectively false from the start.

This propaganda was initially used to terrorize Canadians and then to convince Canadians that an unprecedented government intervention into their lives and the suspension of what Canadians thought to be their fundamental human rights was justified.

Many Canadians not only believed this propaganda but embraced and supported the measures being dictated by the government, despite their obvious shortcomings.

Testimony Concerning the Effect of Propaganda and Terror
Persuasive techniques and manipulation of information were used to promote a specific agenda or ideology, with the intent of gaining support, maintaining power, adopting tectonic shifts in public policy, and inciting fear. Here are some key effects of propaganda that were employed during the pandemic:

- The government distorted or selectively presented information to shape public perception. By framing issues in a particular way, using emotionally charged language, or exploiting existing biases, they were able to influence how people perceived events, individuals, or groups. This manipulation resulted in altered perspectives and skewed understandings of reality. Testimony was heard from a number of witnesses—including Rodney Palmer, who detailed how this was perpetrated on the public via the media.

- The government propaganda sought to mold public opinion by reinforcing certain beliefs or ideologies, while discrediting opposing views. It exploited cognitive biases, such as confirmation bias and selective exposure, to reinforce pre-existing beliefs and create an echo chamber effect. This led to the entrenchment of polarized and biased perspectives, hindering critical thinking and open dialogue. Testimony from Dr. Peter McCullough demonstrated some of the focused techniques that were used to accomplish this.
The government appealed to emotions to elicit specific reactions from the citizens. By evoking fear, anger, or a sense of social responsibility, they were able to mobilize individuals and create a desired emotional response. This emotional manipulation led to impulsive or irrational decision-making, blurring the lines between fact and emotion. Testimony was presented from a number of witnesses detailing how name-calling and shaming was used to develop hatred toward other groups. The Prime Minister of Canada referred to a large and identifiable segment of the Canadian population as “racists” and “misogynists” and threatened them by stating that the government would have to decide how to deal with them. This, in the NCI’s opinion, dehumanized dissenters and promoted hatred and, potentially, violence against this group. Testimony was heard how seniors and disabled persons were violently attacked in public as a result of this type of rhetoric.

The government targeted specific groups or communities, fostering a sense of collective identity and cohesion. By emphasizing common interests and highlighting perceived threats, it created an us-versus-them mentality that further polarized society and exacerbated divisions. This led to social fragmentation and hindered collaboration and understanding among different groups. The government propaganda emphasized how groups of citizens who disagreed with their mandates were placing others in danger, despite the government knowing that the Information they were providing was not true.

Propaganda was used to stifle dissenting voices and alternative perspectives by marginalizing or discrediting them. This can create an environment where individuals fear expressing dissenting opinions or questioning the prevailing narrative, leading to a chilling effect on free speech and the exchange of ideas. Both media and government personalities demonized dissenting opinions. Their labels of “anti-vaxxer” or “science deniers” were intended to associate people who did not consent to the experimental injections with “Holocaust deniers.” Many people fell prey to the fear of being labelled and remained silent.

Propaganda was used to influence behaviours and actions by manipulating public opinion. It shaped public attitudes towards specific policies, products, or social norms, thus directing individual and collective behaviour. This has had far-reaching consequences and impacted voting patterns, consumer choices, and social dynamics. Testimony included commentary on how certain businesses were allowed to remain open while others were closed and how certain community groups were deemed as socially unacceptable.

It is important to be aware of the potential effects of propaganda on the masses and to critically evaluate information and sources.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

It appears that in this instance, the propaganda was so pervasive and so persistent that even the various government agencies either believed the propaganda themselves or were so influenced by the toxic and vindictive environment that they acquiesced to it, despite knowing it was wrong. Lieutenant Colonel David Redman testified that he was aware of senior people within the emergency measures organizations who knew the narrative was false and who further knew that the public health officials were neither trained to, nor capable of, managing and directing an emergency response; however, they kept silent over fears of reprisals.

Promoting media literacy, critical thinking, and an open-minded approach can help individuals guard against manipulation and make informed decisions based on accurate and reliable information. Society benefits from diverse perspectives, open dialogue, and a commitment to truth, which can counteract the negative effects of propaganda.

The second element of the government’s campaign of control included the introduction and promotion of terror towards a purposely unknown and ill-defined menace (pandemic).

According to a variety of testimonies, it was evident that the pandemic had been in the planning stages for years and affected almost every area of our institutions.

The very definition of various fundamental words had been changed shortly prior to the 2020 announcement of the pandemic.

The meaning of fundamental terms such as pandemic, vaccine, and biologic
These fundamental terms have very specific meanings to the population, based on a long history; however, their meaning needed to be changed in order to evoke terror and eventually control masses of people.

Terror is a powerful tool that is used to influence a population through fear and intimidation. Here are some ways this tool was weaponized to influence the population:

Terror was used to create a climate of fear and anxiety within the population. Acts of violence, threats, or intimidation tactics were designed to generate a pervasive sense of insecurity and vulnerability. This fear paralyzed individuals, suppressed dissent, and deterred resistance to the measures. People blindly accepted the narrative and welcomed the absolute violation of their fundamental civil rights, and many were all too willing to actively assist in the suppression of these rights on their fellow citizens.

Demonstrations of extreme violence by authorities were broadcasted daily on legacy media, reinforcing the fear of reprisals for dissent. These included the police actions against the protestors in Ottawa, as testified to by Tom Marazzo.
The government and media organizations utilized acts of terror strategically in order to shape public opinion. They sought and gained sympathy or support for their cause by portraying themselves as victims or by framing their actions as justified responses to perceived injustices. By manipulating narratives and propaganda, they aimed to sway public perception in their favour. This was clearly evident in the Freedom Convoy, which peacefully protested the pandemic mandates in Ottawa. The government used mainstream media to portray these people as violent, racists, and anarchists, who were threatening the very lives of the people of Ottawa. This portrayal terrorized the average Canadian citizen, and combined with a virtual blackout of dissenting options, they were able to mobilize resentment toward this group.

Police were used as an instrument of terror and were employed as a means of exerting control over a population. Through threats of violence or actual acts of brutality, those controlling the police sought to maintain power and ensure compliance with their demands. This created a climate of silence and obedience, stifling dissent and resistance.

Mr. Tom Marrazo testified how he observed the enforcement of terror on innocent and peaceful protestors in Ottawa. He also testified that despite the hundreds or even thousands of security cameras that were deployed in the area surrounding the protests, the government had not released any of the probably thousands of hours of video recordings detailing what exactly happened in the Ottawa protests.

Terror was used to undermine societal stability and erode trust in institutions. By targeting infrastructure, public spaces, or key figures, acts of terror can create a sense of chaos, destabilize communities, and undermine faith in the ability of authorities to protect citizens. This can disrupt social order and create an environment conducive to further manipulation and control. The government targeted dissidents and even church leaders, arresting and jailing several of them across Canada.

Government leaders, including the Prime Minister of Canada, and several Premiers of provinces, openly promoted divisions between groups and used this support to exacerbate existing divisions within society and fuel intergroup conflicts. By targeting specific communities or perpetrating acts of violence that incite retaliatory actions (such as the police actions at the various protest sites), the government sought to deepen social divisions and promote further animosity. A cycle of violence and mistrust ensued, which hindered efforts towards peace and reconciliation.

Terror was used as a tool to suppress dissent and curtail individual freedoms. By creating an atmosphere of fear, some individuals self-censored their views, refrained from expressing dissent, or limited their participation in public life. This enabled the government to maintain control and prevent opposition from emerging.
It is essential to recognize and condemn the use of terror as a means of influencing populations because it undermines human rights, democratic values, and social cohesion. Countering terror requires a multifaceted approach, including addressing root causes of violence, promoting inclusive societies, strengthening institutions, and fostering resilience within communities.

Conclusion

In conclusion, the Commissioners are of the view that the Government of Canada, in concert with provincial governments and the mainstream media, embarked on an information campaign designed to instil fear in the hearts of citizens and ensure that they did not resist any and all draconian measures that were announced. Whether the media were state-controlled or simply agreed with the government’s approach and began repeating their messaging without question was not discovered through testimony at the Inquiry. Further investigation into the relationship between the government and the media during the pandemic time needs to be done. Regardless, the cooperation of the media with the government during this time created a campaign of propaganda and terrorism that represents a grave violation of human rights, democratic values, and the principles of international law. Governments that engage in or support acts of terror against their own people undermine the fundamental rights and freedoms of their citizens, erode trust in institutions, and perpetuate cycles of violence and fear.

The prevention of state-controlled propaganda and terrorism requires a comprehensive approach that includes promoting accountability, upholding human rights, fostering democratic governance, and strengthening international cooperation.

It is crucial to establish robust legal frameworks, independent oversight mechanisms, and a free and independent media to expose and challenge abuses.

Civil society empowerment, education, and awareness play a vital role in advocating for human rights and holding governments accountable for their actions.

International pressure and cooperation are essential in addressing state-controlled terrorism. The global community must stand united in condemning such actions and must utilize diplomatic, economic, and legal measures to hold accountable those responsible for perpetrating or supporting acts of terror.

Ultimately, the prevention of state-controlled terrorism is an ongoing commitment that requires the collective efforts of governments, civil society organizations, and individuals who uphold the values of human dignity, justice, and respect for human rights.

In the instance of the propaganda and terrorism that was perpetrated by the Canadian government on its citizens, we acknowledge that this campaign could not have been successful except for the collusion and cooperation of the traditional media in Canada.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

There was almost a complete and utter lack of criticism or questioning of any of the media narrative. To this day, despite the mountain of evidence that the severity of the pandemic was seriously overblown and that the measures, both pharmaceutical and non-pharmaceutical, did unimaginable harm to our county, no traditional media outlet has launched any kind of unbiased investigation.

Recommendations

Preventing governments from using propaganda and terror against their people requires a multifaceted approach that involves promoting accountability, safeguarding human rights, and fostering democratic institutions. Here are some key strategies:

A. **Establish and uphold a robust human rights framework** that protects the fundamental rights and freedoms of individuals. This includes enshrining indelible human rights in constitutions, implementing international human rights conventions, and ensuring an independent judiciary to safeguard citizens’ rights.

B. **Foster a strong rule of law** by ensuring that government officials and security forces are held accountable for their actions. This includes establishing independent oversight bodies, conducting transparent investigations into allegations of human rights abuses, and prosecuting those responsible for violations.

C. **Promote freedom of expression** and an independent media that can serve as a watchdog to hold governments accountable. Protect journalists, bloggers, and activists from harassment, censorship, financial repercussions, and violence, and ensure their ability to report on government actions without fear of reprisal.

D. **Support and empower civil society organizations**, including human rights groups, advocacy organizations, and community-based initiatives. These organizations play a crucial role in monitoring government actions, advocating for human rights, and providing support to victims of abuse.

E. **Promote and strengthen democratic governance** by ensuring free and fair elections, transparent electoral processes, and respect for the will of the people. This includes promoting political participation, guaranteeing the independence of electoral bodies, and providing opportunities for citizens to engage in decision-making processes.

F. **Leverage international cooperation** and pressure to address human rights violations. Encourage diplomatic efforts, international organizations, and regional mechanisms to hold governments accountable for their actions, and impose targeted sanctions or other measures against those responsible for terrorizing their own populations.

G. **Support international human rights mechanisms**, and provide them with the necessary resources and authority to investigate and address human rights violations perpetrated by governments. Collaborate with these mechanisms to bring attention to abuses and advocate for meaningful action.
H. **Promote human rights education** and awareness among citizens, government officials, and security forces. Encourage a culture of respect for human rights, tolerance, and non-violence through educational programs, public campaigns, and training initiatives.

Preventing governments from using terror against their people requires ongoing commitment and vigilance. It is a collective effort that involves the active participation of citizens, civil society, international actors, and the government itself. By upholding human rights, promoting accountability, and fostering democratic values, societies can strive towards preventing and addressing government-led terror.
7.2.3. Social Effects of Mandates on Canadian Institutions

Introduction

Historically, Canadians have had a high level of trust in their public institutions. Trust in public institutions is often measured through public opinion surveys which assess public confidence in various institutions, including government, parliament, the judiciary, the police, and public health agencies.

While trust levels can fluctuate over time, especially in response to specific events or policies, Canada has consistently ranked relatively high, compared to many other countries, in terms of public trust in institutions. Factors contributing to this trust include Canada’s reputation for political stability, democratic governance, and robust public services.

The long-term effects of government actions during the COVID-19 pandemic has significantly reduced Canadians’ confidence and trust in their government institutions. This erosion of trust in the fundamental institutions of Canada is prevalent not just in Canada but around the World.

According to the testimony of Gail Davidson, Canada no longer enjoys the trust of its citizens or that of the citizens of much of the world.

The perception of tyranny is subjective and can be influenced by a range of factors, including political biases, international relations, media narratives, and individual experiences.

While opinions may differ, it is worth noting that Canada no longer enjoys a universally positive reputation for democratic governance and respect for human rights, globally.

Canada’s long standing tradition of fairness and transparency has been severely eroded, and this negative perception will affect Canadian society for generations to come.

The intent of this section is to provide an overall or general commentary on the subject of institutional trust: detailed discussion and analysis of certain institutions included here are contained in other sections of this report.

Testimony of Witnesses’ Social Effects of Mandates on Canadian Institutions

Many witnesses testified as to the performance of the fundamental institutions of Canadian society during the COVID-19 pandemic.

Canadian institutions that were discussed included the following:

- Parliament, legislatures, executive branch,
- Judiciary,
- Legal profession,
- Police,
- Healthcare,
- Regulatory agencies,
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

- Media,
- Financial institutions,
- Human rights organizations,
- Universities/public schools,
- Churches, and
- National/multinational corporations.

Witness David Leis spoke at length about the absolute erosion and wanton destruction of traditional Canadians’ confidence in their democratic institutions and how the existential survival of traditional Canadian democracy was in peril.

Regina Goman spoke about her experience in communist Poland and her participation in the Solidarity movement. She told how, based on her experience in Poland, the actions of the Canadian government in restricting and cancelling basic human rights was a stark warning to Canadians that the country was slipping toward tyranny.

Lt. Col. David Redman, who is an expert on emergency planning, testified that despite his expertise, he found the different levels of government would not listen to his counsel concerning the emergency response to the pandemic, and he further stated that the professionals in the emergency planning agencies were sidelined. In his opinion, the emergency response was a complete failure from the outset, and the government was hostile to any suggestions that may have improved the results.

Gail Davidson, an expert in international human rights law, spoke about how, in her opinion, Canada violated the International Human Rights treaties to which Canada is a signatory and is legally obligated to uphold.

Retired Judge Brian Giesbrecht testified that he felt the courts and judiciary had failed Canadians. He testified that, in his opinion, the courts were no longer accessible to Canadians and that the judiciary was avoiding their responsibility to deal with difficult issues that have arisen during the pandemic. Judges often succumbed to political pressure to follow the pandemic narrative, and Canadian citizens no longer received fair and unbiased hearings.

Legal tools such as rulings of “mootness” and “judicial notice” were used to avoid hearing and ruling on government actions. Judges simply deferred to government regulations, robbing citizens of equal standing under the law.

Lawyer Bruce Pardy spoke about how the courts have demonstrated a bias toward the government position, as opposed to testing the narrative. He also spoke about the weakness of the Charter of Rights and Freedoms.

Lawyers James Kitchen, Jeffrey Rath, and Leighton Grey spoke at length about the failure of the Canadian judiciary.
Several doctors—including Dr. Chris Milburn, Dr. Phillips, and others—stated that the Colleges of Physicians and Surgeons failed at protecting the public. In the opinion of the witnesses, the Colleges of Physicians and Surgeons simply enforced the government narrative and did not base their actions on an understanding of science. In addition, these regulators inserted themselves between physicians and patients as well as striking down long held principles and practices in medicine.

Health Canada promoted racial division in Canada by offering early eligibility of the vaccine based on race, as opposed to identifying vulnerable people of all races, based on age and comorbidity. This practice built up a feeling of resentment within Canada.

Many witnesses testified about how they were treated by the police. Tom Marasso, Vincent Gircys, Richard Abbot, Danny Bulford, and others testified concerning the assault of citizens by police organizations during the demonstrations. In their opinion, the police were no longer acting as protectors of the public but were acting as enforcers of the government edicts. Inappropriate conduct included various breaches of many aspects of the Charter of Rights and Freedoms as well as police using excessive force when dealing with peaceful protest.

Several pastors testified that the police were used to forcibly invade their churches to shut down religious services and arrest pastors.

Rodney Palmer and Marianne Klawak spoke about the complete absence of any traditional journalistic standards in Canadian media. Mr. Palmer detailed bias, misleading news stories, and significant omissions of opinions that were counter to the government narrative.

Several witnesses spoke about the actions of Canadian financial institutions in the freezing of bank accounts of citizens who had not been convicted of any crime. The financial institutions simply undertook to freeze bank accounts, without any push-back on the regulator, nor was there any evidence that these institutions consulted their legal counsel in any kind of an effort of protecting the rights of their depositors.

Testimony was received from witnesses who refused to be coerced to take an experimental injection and, as a result, were dismissed from their jobs. Employers took unilateral actions which allegedly violated human rights. Many of these dismissed employees took their complaints to their unions and the human rights commission, where their complaints were dismissed. Neither the unions or the human rights commissions actually took any action to challenge the employers on these violations.

Universities and public schools followed the government mandates without any regard for the detrimental effects that students were experiencing. The Commissioners heard testimony from retired professors, teachers, and students. In many instances, the institutions adopted policies that were more restrictive than those enacted by the government, and often they prolonged the implementation of these restrictions.
According to the witnesses, students were impacted in a variety of ways that included lost educational opportunities, physical distress, and social and mental developmental damages. Further administration of many schools allowed a toxic atmosphere of hate and bullying to develop against anyone who did not comply with the narrative.

Many churches failed their congregations and were in lockstep with government directives restricting their operation. This was despite the obvious contradictions in the regulations that allowed big box stores, liquor stores, and cannabis stores to remain open as essential services. After the initial pronouncement of the pandemic and lockdowns, most pastors complied and closed their churches to protect the congregations. As the mandates continued and deepened, and it became obvious that the mandates and lockdowns were wrong, many pastors reopened their churches, understanding that the church plays a vital role in the mental, social, and spiritual health of their congregations. Wesley Mack, Hon. PhD, testified on the importance of church attendance to communities of faith.

Testimony was received from pastors who were fined, arrested, jailed, or forced out of their churches, including Pastor Steven Flippin, Pastor James Coates, Pastor Jason McVicar, and Tobias Tissen.

Witnesses testified that national and multinational corporations, including pharmaceutical companies, allegedly took advantage of the environment of terror and panic that gripped the government and the country. Employees were terminated due to non-compliance with unilateral injection mandates.

Pharmaceutical corporations took advantage of panicky and inexperienced government regulators to negotiate incredible concessions on the approval, manufacture, and distribution of an experimental gene therapy while protecting themselves from liability.

Large corporations also turned over confidential client records and monitored clients on request of the government. In some instances, this was done without a court warrant and without the conscious knowledge of the clients. One example discussed was the monitoring of over 30 million Canadians, through their cell phones, by Health Canada.

Conclusions
Here are a few reasons why Canadians’ trust in their institutions has been shaken:

**Democratic Values and Political Stability**

Canada was traditionally widely regarded as a stable and well-functioning democracy. It has had a long-standing tradition of upholding democratic values, including free and fair elections, the rule of law, freedom of speech, and respect for human rights. These factors contributed to Canada’s reputation as a country with strong democratic institutions.
Over the course of the pandemic, many of these democratic rights were attacked, diminished, or eliminated. The Government of Canada, along with the provincial governments, effectively suspended many of the fundamental human rights as set out in the Charter of Rights and Freedoms. They suppressed peaceful dissenting opinions; they arrested peaceful protestors; and they silenced dissent through the use of the judiciary, police, and even financial institutions.

Canadians were so accustomed to their rights that they could not bring themselves to believe what was happening before their very eyes.

Many Canadians found themselves in a position where they could not obtain legal counsel, as many lawyers in Canada would not represent persons who were challenging the government lockdowns and mandates.

**Multiculturalism and Inclusivity**

Canadians are known for their commitment to multiculturalism and diversity. The Canadian government, however, had established policies and programs to promote the vilification of certain groups of Canadians by using a propagandized narrative of institutional racism. In order to “protect” these threatened minority rights, they enacted extremely obtuse laws and regulations which are being used to stifle legitimate dissent and to force citizens to accept their extreme policies or face legal consequences. Those consequences include arrest, fines, and incarceration. This change in approach has not gone unnoticed in the international community.

**Strong Human Rights Record**

Canada has previously been recognized for its commitment to human rights, both domestically and internationally. Canada is a signatory to numerous international human rights treaties and has actively participated in global efforts to promote and protect human rights. During the pandemic, Canada enacted policies and enforced new laws which suspended human rights in the country, and many of the measures were in direct violation of the international human rights treaties to which Canada is a signatory. Gail Davidson, an expert in international law, set out the details of these gross violations, in her testimony.

Canada’s legal framework, including the Canadian Charter of Rights and Freedoms, failed to protect the individual rights and freedoms of its citizens. Many of the most basic and fundamental rights “guaranteed” by the Charter were simply brushed aside, under section 1 of the Charter, titled “Guarantee of Rights and Freedoms.” By invoking this clause, and without providing clear and transparent justification of the reasons, the government was able to suspend Charter freedoms, and the judiciary did nothing to stop them.

**Perception of Government Response**

The lack of effectiveness, transparency, and communication of government responses to the pandemic influenced significant mistrust in institutions. Governments demonstrated a lack of
a lack of efficient and transparent decision-making, they did not communicate clearly, and they did not implement evidence-based measures.

Objectively false statements, missteps, inconsistent messaging, and delays in decision-making eroded trust.

**Political Polarization**

The pandemic became politicized in most contexts, leading to polarization and divisions along political lines. Trust in government institutions was influenced by pre-existing political beliefs, with individuals more likely to trust or distrust institutions based on their alignment with their political ideologies.

**Communication and Information Dissemination**

The ability of governments to effectively communicate accurate and timely information is crucial in building trust. The governments in Canada did not engage in open and transparent communication. Although they provided regular updates, many in the population knew that the updates were skewed and biased. In addition, the government relied on “trusted” experts who, in many instances, were known to have received significant government funding and thus had a conflict of interest, which eroded trust in government institutions.

**Handling of Crisis Management**

The perception of how well government institutions handled the crisis—including the ability to control the spread of the virus, implement effective public health measures, and protect vulnerable populations—influenced trust.

The public health officials in charge of the emergency response displayed no expertise in emergency management, and the existing emergency planning apparatus was sidelined.

Elected officials who are supposed to remain in control of any crisis situation abrogated these responsibilities to non-elected, and all too often incompetent, bureaucrats with no experience in crisis management.

**Trust in Science and Expertise**

Trust in government institutions was influenced by the public’s perception of the government’s reliance on skewed, false, incomplete, and biased scientific evidence and expertise.

Governments did not follow evidence-based decision-making and sought guidance from inept and inexperienced public health officials and even disregarding crisis plans previously developed by the same public health officials.

Decisions were perceived as politically motivated or contradicting scientific consensus, further eroding the trust of Canadians.
Social and Economic Impacts

The social and economic impacts of COVID-19 mandates—such as business closures, job losses, and financial hardships—have influenced trust in government institutions. Individuals and communities experiencing negative consequences rightly attributed these difficulties to government decisions, which led to decreased trust.

Trust in Public Health Institutions

The response of public health institutions, such as the Public Health Agency of Canada and local health authorities, influenced trust in the broader government system.

Trust in these institutions was crucial, as they provided guidance, expertise, and recommendations during the crisis. The directives being issued by public health were often erratic and were given in a state of panic; and many of the regulations and edicts contradicted long-held medical practice, and all too often they made no sense in a medical or scientific way.

The public was never presented with an overall plan but was simply exposed to a long list of rules and regulations, without any consideration for the quickly developing situation. A dizzying array of different rules from province to province further contributed to a perception that the measures were political and not informed by good health policy.

It is important to recognize the pandemic and its impact on trust in government institutions as complex and multifaceted. Trust can be influenced by a combination of factors, and individual experiences and perspectives play a role. Governments that actively address concerns, engage in transparent communication, prioritize public health, and demonstrate accountability have a better chance of rebuilding and maintaining trust in the long term.

Recommendations

The process of restoring trust in Canadian institutions is a very difficult and complex one. What was destroyed in a very short period of time will take a generation to restore, and only if these institutions make a concerted effort to restore that trust through their day-to-day actions.

Momentary publicity campaigns and propaganda blitzes will not serve either the institutions or the people of Canada’s best interests.

If these concerns are not addressed in a forthright manner, the very existence of Canada as a free and democratic nation is at risk.

We recommend the following:

A. It is not an option to take a “business as usual” posture and simply carry on as if nothing happened. Institutions must recognize and publicly admit their culpability in what was perpetrated on Canadians and, if appropriate, must face criminal and civil penalties for their actions.
B. **Transparency and Accountability:** Information related to the institutions’ actions during the COVID-19 pandemic must be made publicly available, creating a culture of transparency and accountability within public institutions.

C. **Ensure that decision-making processes** are open and accessible to the public, and that the actions and performance of public officials are subject to scrutiny.

D. **Establish mechanisms for oversight,** such as independent audits or ombudsman offices, to hold institutions accountable for their actions.

E. **Ethical Conduct:** Promote and enforce high ethical standards within public institutions. Implement robust codes of conduct that govern the behaviour and decisions of public officials and employees. Provide ethics training to ensure that individuals understand their responsibilities and the expectations placed upon them.

F. **Effective Governance:** Strengthen governance structures and mechanisms to ensure efficient and effective functioning of public institutions.

G. **Enhance the professionalism** and expertise of public servants through training and development programs. Foster a merit-based culture that rewards competence and performance.

H. **Public Engagement:** Actively engage with the public and involve stakeholders in decision-making processes. Seek public input through consultations, town hall meetings, surveys, and other participatory mechanisms. Demonstrate that public institutions are responsive to the needs and concerns of the people they serve.

I. **Communication and Information Dissemination:** Establish clear and consistent communication channels to keep the public informed about the work and activities of public institutions. Provide timely and accurate information, particularly in times of crisis or controversy. Use plain language and accessible formats to ensure that information is easily understandable by all segments of society.

J. **Collaboration and Partnerships:** Foster collaboration and partnerships with civil society organizations, academia, and other stakeholders. Engage in meaningful dialogue and involve external expertise in policy development and implementation. Collaborative approaches can help build trust and ensure that institutions benefit from diverse perspectives.

K. **Learn from Mistakes:** Acknowledge and learn from past mistakes or failures. Publicly address any instances of wrongdoing or misconduct, and take corrective actions. Demonstrate a commitment to learning, improvement, and the prevention of similar issues in the future.
L. **Long-Term Vision and Consistency**: Develop and communicate a clear long-term vision for the institution’s role and purpose. Demonstrate consistency in actions and decision-making, avoiding unnecessary reversals or abrupt changes. Consistency helps build trust by showing that institutions are reliable, accountable, and predictable.

M. **Independent Oversight and Checks and Balances**: Strengthen the role of independent oversight bodies, such as auditors general, ombudsman offices, or anti-corruption commissions. These bodies can provide an additional layer of accountability and help prevent abuses of power or corruption.

Rebuilding trust in public institutions is a long-term endeavour that requires sustained commitment and effort. By implementing these strategies, institutions can work towards restoring faith in their integrity, competence, and ability to serve the public interest.
7.2.4. The Impact of COVID-19 Measures on the Military

Introduction
The Commission heard from current and former members of the Canadian military, as well as a lawyer who represented hundreds of current members and veterans who were disciplined or dismissed as a result of the COVID-19 mandates.

Based on the testimony, the Canadian military placed the uptake of vaccines ahead of the safety of members of the Armed Forces, which served to destroy morale and has the carryover effect of weakening Canada and the defence of our nation.

Dr. Matthew Tucker (Truro, NS)
Devon Sexstone (Winnipeg, MB)
Michel Gagnon (Winnipeg, MB)
Catherine Christensen (Red Deer, AB)
Josée Belleville (Québec City, QC)
Terry LaChappelle (Truro, NS)

Impact of Pandemic Measures on the Canadian Armed Forces
Members of the Canadian forces are required to receive a large number of vaccines during their service. The Commission heard from several former members who had consented to receiving multiple vaccines in the past, often stating, with pride, that they had received more vaccines than anybody else in the room. Despite this history, the requirement to receive the COVID-19 vaccine was not acceptable to many.

The Commission heard testimony that many members were coerced into taking the vaccine in order to keep their jobs. Additionally, many former members testified personally about their experience in being discharged due a refusal to receive the vaccine. These included: Devon Sexstone, Michel Gagnon, and Josée Belleville. Additionally, Terry LaChappelle, a veteran and civilian contractor on the CFB Trenton base, lost his job.

Michel Gagnon testified that there were very few members of the services who were capable and trained to fly military planes like he was. He estimated that the total cost to train him was approximately $2 million. The removal of him as a pilot is a costly loss to the Canadian Armed Forces.
Dr. Matthew Tucker, who worked as a family doctor for members of the Canadian Armed Forces, testified that during the pandemic, he experienced an increase in patient visits for mental health issues, which he attributed to the pandemic restrictions. During this time, he also worked as an emergency doctor at a civilian hospital. He did not treat a single patient for COVID-19 until January 2022.

Dr. Tucker testified that there is a crisis in the military in terms of morale and that many are leaving the service. As a result, he is concerned about the security of our country. Mr. LaChappelle estimated that 800–900 military personnel were dishonourably discharged as a result of refusing the vaccine. Some were called back, but many refused to return.

Ms. Christensen testified that the Canadian Armed Forces lost an estimated 3000 to 5000 personnel due to the mandatory vaccination policy, out of a regular force of 68,000. She estimated that this included personnel who were discharged as well as those who experienced vaccine injuries. This is the highest loss of personnel since World War II. Ms. Christensen stated that the cost to the Canadian Armed Forces exceeds $3 billion in loss of training, experience, and expertise. This does not include costs to the members. She further discussed the toxic environment that was promoted and created within the Canadian Armed Forces against the unvaccinated, which she claimed was ongoing.

**Implementation of the Vaccine Mandates**

At first, the Canadian Armed Forces did not implement a mandate; they simply applied pressure to members to “do the right thing.” However, in the fall of 2021, the military announced that it would “show leadership” and “set an example” by having a 100 per cent vaccine rate within its ranks.

Implementing a mandate in order to set an example does not support the position that the mandate had anything to do with the health of the members of the Canadian forces. The job of the Canadian military is not to set an example to the rest of Canada about their personal health choices. Moreover, the members of the military are an unusually healthy subset of the population, who were at very low risk of negative outcomes from COVID-19.

The Armed Forces can order soldiers into life-threatening situations. Ms. Christensen’s testimony was that this power was abused when implementing the mandate. Soldiers are expected to rely on their superiors to look out for them, and only order them to make sacrifices on good principle. This covenant was broken by the vaccine mandates.

Because the COVID-19 vaccines were new, experimental products with no long-term safety data, the military mandate had the effect of causing Canada’s military personnel to be treated as guinea pigs. The vaccines carried the risk of injury and death (albeit small), meaning that the mandate put soldiers in danger—but not for the purpose of defending the nation. Notably, the Commission heard that there had been zero deaths in the Canadian Armed Forces from COVID-19.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Avenues of Recourse for Members of the Canadian Armed Forces

Interestingly, the vaccine mandate was implemented by way of a directive, instead of an order. Ms. Christensen described the difference between an order and a directive.

An order could be: Take control of a particular hill. Directives would then follow that determined how to take the hill. There is no appeal for a soldier who fails to follow a directive. The Commission heard testimony that if the mandate had been made by way of an order, then the military would have had to accommodate requests for exemptions, such as religious exemptions. Ms. Christensen believes that the mandates were implemented by way of directive in order to avoid this process, and ensure that no exemptions were given—as part of meeting the stated goal of 100 per cent vaccinated.

Members of the Canadian Armed Forces who have grievances about their employment are not entitled to apply to a court. Thousands of members filed complaints about the mandates. The problem is that complaints went to the Chief of Defence Staff for review. The Chief of Defence Staff, however, is the one who implemented the mandate in the first place. Thus, members were left with no avenue or recourse within the services.

Trust among the ranks has been seriously eroded.

Members were gagged from speaking out against the mandates.

Members of the Canadian forces are prohibited from speaking out against the military, or their chain of command. Any members who do speak out publicly are disciplined.

It is for this reason that Canadians have not heard about the crisis in the Canadian Armed Forces that has resulted from the vaccine mandates. The Commission also heard testimony that members who were injured or disagreed with the mandates (whether vaccinated or not) were afraid to speak up. The Commission watched a video of members who were involved in fighting the mandates, and many of the faces were obscured or blurred to protect their identities.

Testimony Concerning Vaccine Injuries in the Armed Forces

Ms. Christensen testified that service members who became vaccine injured were told that their injuries were not service-related. This meant that injured members were not entitled to either a medical release from the services or compensation for their injury.

Recommendations

The fact that a citizen has put on a uniform and vowed to serve and protect Canada should not strip them of all rights and leave them with no legal avenues. The Commission makes the following recommendations:

A. **Grievances by service members** should be outside of their chain of command and to an independent reviewer, such as the Office of Inspector General.
B. **Whistleblower legislation should be strengthened** to allow soldiers to report on abuses within their chain of command without fear of discipline or retaliation.

C. **Comprehensive healthcare should be provided** to all injured service members, for as long as necessary.

D. **An apology** should be issued for implementing the vaccine mandate.

E. **Where a medical product is provided** to members of the Armed Forces, mandatory monitoring and reporting of injuries and sickness should be performed.
7.2.5. Impact of COVID-19 Measures on the Education System

Introduction
The Government response to the COVID-19 pandemic has significantly disrupted nearly every facet of life, including education. This is a global phenomenon, but the focus in this report is specifically on Canada, where the education system, from primary school to university, has been deeply affected by the pandemic and the ensuing government-imposed measures.

When we speak about the education system, we must remember that we’re not simply discussing infrastructure, textbooks, and school buses. Rather, at the heart of this system are precious young individuals—children and adolescents whose dreams, aspirations, and futures have been entrusted to it. It is their right to have an environment that promotes learning and creativity, while also offering them safety, stability, and the means to grow holistically. They are not mere numbers on an enrolment sheet but unique individuals with their own potential and vulnerabilities.

In the context of the COVID-19 pandemic, it’s crucial to acknowledge that the education system completely failed due to the restrictions placed upon it by the government and the teachers unions. The purpose of this system extends beyond the imparting of academic knowledge, such as reading, writing, and arithmetic. It is equally tasked with safeguarding the mental, emotional, and social wellbeing of its students, protecting them from harm both inside and outside the classroom.

Unfortunately, due to the unprecedented actions taken by the government during the pandemic, the system was strained beyond its capacity. While a half-hearted attempt to continue providing education through online platforms was initiated, it fell short in shielding its students from the mental, emotional, and developmental impacts of this global crisis. Hence, it is vital to recognize these shortcomings and work tirelessly towards addressing them, keeping in mind that the lives and futures of our young ones hinge on these actions.

The actions taken by the government were unnecessary, based the testimony of witnesses who stated that the information concerning which populations were actually at risk was available and known to public health as early as March of 2020, when the declaration of a pandemic was made. Further, the actions taken to contain the spread of the virus were ineffective and created a cascade of changes and challenges for both educators and students.

Canadian education had to shift gears rapidly, moving from in-person teaching and learning to online modalities. Teachers had to quickly adapt to new ways of delivering lessons, while students had to adjust to learning from home, often with varying degrees of success. Not only has this transformation impacted the quality and access to education, but it has created significant mental health implications for children and young adults, and created a new group of “unschooled” children who are at risk of never acquiring even a basic education.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The following sections will examine the impact of the government’s response to COVID-19 on various levels of education in Canada. This will include a review of how the sudden transition to online learning has deepened the digital divide, affected academic progress and access to school-provided nutrition, and disrupted tertiary education.

The profound impact of these measures on children’s mental health, brought on by social isolation, increased anxiety and depression.

Based on the testimony and analysis, a series of recommendations are made to mitigate some of the damage done and help Canadian education emerge stronger and more resilient from this unprecedented crisis.

Witness Testimony
The following witness testimony was utilized in the analysis:

**Cathy Careen**, a teacher, tried to get an exemption from the mandatory vaccines. She was eventually terminated for not taking the vaccine.

**Bliss Behar** was a high school student when the vaccine mandates were imposed on his school. After doing his own research into the vaccines, he decided he should not take a vaccine. As a result, he dropped out of school. He spoke out and was subject to attacks on social media.

**Dr. Irvin Studin** testified that he began seeing children out of school in 2020, and it took him several months to understand what he was seeing. On further investigation, he was better able to appreciate the extent of what was happening. He stated the degree to which our childhood education system had collapsed in Canada. It was an experience completely foreign to such a developed country.

**Kim Hunter**, a teacher for 25 years, talked about the effects of masking on children.

**Kassandra Murray**, a school teacher, testified to the effects of masking on children and how a toxic environment developed within the classroom due to the mandates and the fear of other staff.

**Kathy Howland**, an education assistant, spoke about being forced to take the vaccine and her alleged adverse effects from the vaccine.

**Katrina Burns**, a teacher for seven years, spoke about the effects of masking on children in the classroom.

**Elizabeth Galvin** had a daughter who committed suicide after she found herself isolated and scared when the university closed the campus.

**Jay McCurdy** was a teacher of grades 7 and 8. He testified to the effects of the lockdowns on students.
Pierre Attallah had two children in school and testified to the effects of the mandates on his children.

Leigh Vossen was a student in university at the time of the lockdowns, and testified concerning her experiences.

Kyra Pituley was a 15-year-old student in Grade 9, and she spoke about how the lockdowns and remote learning impacted her.

Stephanie Foster was a teacher assistant; she had to get the vaccine to keep her job; she has had an alleged vaccine injury.

Charlotte Garrett was a teacher for disabled adults; she described her alleged vaccine injury and also discussed the effect of the mandates and lockdowns on her students.

Kelcy Travis, the mother of six children, described the effects the mandates had on her family and children.

Chantel Kona Barreda was teaching on a reserve when the mandates were put in place; she lost her job for refusal to take the vaccine.

Dianne Molstad was a teacher and a councillor for 30 years. She described her experiences with applying for a vaccine exemption.

Angela Tabak spoke about her son. He was forced to take online courses and could not access his psychiatric care; he committed suicide.

Dr. Patrick Provost, a university professor, was suspended for six months without pay for speaking out against the vaccines for children and questioning the narrative of the COVID-19 pandemic. He was facing the prospect of losing his tenure.

Madison Peake was a student in university when the mandates were put in place. She spoke about the effect of the mandates on her education and on her family.

Dr. Keren Epstein-Gilboa, an expert on childhood traumas, spoke about the effects of the mandates and masking on children.

Aidan Coulter was enrolled as a student at university. He was not allowed back to classes due to vaccine mandates.

Discussion of Impacts on Education

Primary and Secondary Education: In response to the COVID-19 pandemic, Canadian provinces and territories transitioned primary and secondary schools to remote learning. This change was unnecessary and had numerous unrecognized or ill-considered consequences.
One significant impact was the widening of the digital divide. Not all students had access to reliable Internet or technology, which led to disparities in educational attainment.

Not every student had access to a safe and suitable space in which they could attempt to home-schooled; for some, school is the only safe space available.

There were also challenges in teaching certain subjects, like science and arts, which often required hands-on learning.

Further, schools provide more than just education; they are a source of nutrition for many children. The government-imposed COVID-19 response brought considerable developmental challenges for primary grade children, encompassing social, mental, speech development, and disturbing increases in mental illnesses and antisocial behaviour.

Social Development: Social interactions at school are pivotal in children’s social development, teaching them to communicate, share, negotiate, and develop empathy. With school closures and social distancing measures, children have lost out on these valuable interactions. Playdates, an essential aspect of social learning and emotional understanding, have also been severely limited. This lack of social interaction can hinder children’s ability to build social skills, establish strong relationships, and understand social norms and cues.

Mental Development: The mental wellbeing of children has been significantly impacted by the pandemic. As routines and structures have been upended, children have experienced heightened stress and anxiety. The uncertainty surrounding the pandemic, fear of the virus, and reduced contact with supportive networks (friends, teachers, extended family) has exacerbated this situation.

Speech Development: Speech and language skills often develop rapidly in primary grade children, supported by interactions with teachers and peers. Reduced interaction time with teachers, who play a crucial role in correcting and improving a child’s speech, can slow speech development. Moreover, children learn language not only from explicit teaching but also from overhearing and participating in conversations. The shift to online learning limits these opportunities.

Increase in Mental Illnesses and Antisocial Behaviour: The mental strain of the pandemic, along with social isolation, can lead to a range of mental health issues, such as depression and anxiety. Children may not fully understand why their routine has been disrupted, leading to feelings of confusion and stress. The pandemic also resulted in increased screen time, which can contribute to sleep issues, physical inactivity, and reduced social skills, further impacting mental health. Regarding antisocial behaviour, long-term isolation and lack of peer interactions may lead to difficulties in social situations and reduce the development of empathy and sharing habits.
To mitigate these effects, it’s important to create structures that can support children during these challenging times. This could include virtual social activities, increased access to mental health supports, structured home routines, limited and purposeful screen time, and involving children in family conversations to stimulate speech development. It’s also crucial for adults to openly discuss the pandemic with children in age-appropriate ways to reduce fear and anxiety.

**Tertiary Education**

Colleges and universities also shifted to online learning. The abrupt transition negatively impacted the quality of education due to reduced student engagement, lack of practical learning opportunities (especially in STEM (Science, Technology, Engineering, and Medicine), medical, and technical disciplines), and networking opportunities.

The government actions during the COVID-19 pandemic caused numerous disruptions to the lives of university and college students. The lock downs and school closures have led to lost opportunities and delays that can have long-lasting implications on these students’ educational and career trajectories.

Delayed Academic Progress: With the abrupt closure of universities and colleges, many students faced delays in their academic progress. While some courses transitioned online, others, particularly lab-based or practical courses, were more challenging to adapt. This led to incomplete courses, postponements, or even cancellations, forcing students to defer their graduation dates.

Lost Opportunities for Research and Internships: For many students, especially those pursuing graduate degrees, participating in research projects is a crucial part of their education. The pandemic led to the suspension of many such projects, robbing students of valuable research opportunities. Additionally, internships, a vital stepping stone to the job market, were cancelled or shifted to a virtual format, often providing a less enriching experience.

Reduced Networking Opportunities: Universities and colleges provide students with various opportunities to network with professors, alumni, visiting scholars, and industry professionals. This networking often leads to job opportunities, internships, or collaborations. The transition to virtual learning has significantly reduced these opportunities.

Limited Access to Campus Facilities: Access to facilities like libraries, labs, study rooms, and sports complexes significantly enrich the learning experience. The closure of these facilities due to lock downs not only disrupted students’ academic progress but also negatively impacted their overall university experience.

Challenges in Transitioning to the Job Market: The economic downturn brought about by the pandemic has led to a challenging job market for new graduates. The lack of internships and networking opportunities due to lock downs further compounds this problem.
Loss of Campus Experience: Beyond academics, the college or university experience is often about personal growth and the creation of lifelong memories. The shift to remote learning has resulted in a loss of campus life experience, including participation in clubs, sports, cultural events, and social interactions, all of which contribute significantly to a student’s personal development.

The pandemic’s impact on higher education was profound and led to significant delays and lost opportunities. It is crucial for institutions to find innovative ways to support students during these challenging times, such as virtual internships, online networking events, and flexible academic plans.

Impacts on Mental Health

Schools and universities are not just places of learning; they are also hubs of social interaction and play a significant role in mental health. The changes wrought by the pandemic have had substantial mental health impacts.

Social Isolation

Social isolation, a significant consequence of lockdown measures, involves reduced social interaction and physical contact with others. This abrupt shift in daily life is deeply disconcerting, especially for elementary, high school, and university students who are used to a routine packed with social interaction. This transition affected students’ mental and emotional health, educational progress, and overall wellbeing in a variety of ways.

Emotional Impact: The sudden loss of everyday contact with friends, classmates, and teachers can lead to feelings of loneliness, sadness, and frustration. For many students, school is not just a place of learning but also a vital social environment. Without these regular interactions, students may feel cut off from their social networks, leading to a sense of isolation.

Mental Health Effects: Prolonged social isolation can exacerbate feelings of anxiety and depression. Human beings are innately social creatures, and isolation can create a heightened sense of stress and worry. It can also lead to a decrease in motivation and concentration, impacting students’ academic performance.

Educational Disruption: Collaborative learning opportunities have been proven to enhance understanding and problem-solving abilities. The absence of face-to-face group work can affect students’ learning experience and engagement levels, possibly leading to a decline in academic performance.

Development of Social Skills: Particularly for younger children, school is a critical setting for developing social skills, forming friendships, and understanding social norms. Social isolation can hinder the development of these critical skills.
Lack of Routine: For many students, the structure and routine provided by attending school or university provide a sense of normalcy and control. The loss of this routine can create feelings of disorientation, restlessness, and anxiety.

Physical Health: Reduced opportunities for physical activity (gym classes, sports teams) can lead to a more sedentary lifestyle, potentially impacting students’ physical health and increasing feelings of lethargy or sluggishness.

Loss of Support Systems: For some students, school is a safe haven, providing support systems like counselling services, mentors, and free meals. The loss of these services can exacerbate feelings of isolation and insecurity.

The impacts of social isolation due to school and university closures are profound and varied, underlining the critical role that these institutions play beyond academic instruction. They’re essential for social interaction, mental health support, and a stable routine—all of which are crucial for a student’s holistic development.

The Commission heard testimony from witnesses who stated that their children had simply dropped out of school, or had succumbed to depression and despair, with some resorting to suicide.

**Anxiety and Depression**

Several key factors have contributed to an increase in anxiety and depression among school-age students during the COVID-19 pandemic:

Social Isolation and Loneliness: School closures and social distancing measures led to prolonged periods of isolation from peers, which play a crucial role in a child’s social and emotional development. Missing out on these interactions could lead to feelings of loneliness and alienation, which could trigger or exacerbate anxiety and depressive symptoms.

Disrupted Routines: School provides a structured routine that offers predictability and a sense of control to students. The sudden loss of this routine due to the pandemic could lead to feelings of uncertainty, which is a common trigger for anxiety.

Online Learning Challenges: The transition to online learning presented its own set of challenges. Some students may have struggled with the lack of in-person instruction, technological issues, or lack of a conducive learning environment at home. The stress and frustration from these challenges could contribute to feelings of anxiety and depression.

Fear and Uncertainty about the Pandemic: The continuous flow of news about the pandemic, coupled with fear about contracting the virus or it affecting loved ones, could lead to elevated anxiety levels. Uncertainty about the future, concerns about academic progress, and changes in exams and grading could also increase stress and anxiety.
Limited Access to Mental Health Services: Many students rely on school-based services for mental health support. With schools closed, students may have found it more difficult to access these services, causing existing mental health conditions to worsen.

Grief and Trauma: Some students may have lost loved ones to the virus, causing profound grief and potentially leading to depressive symptoms. Others might have had parents or caregivers working on the frontlines, causing additional worry.

Increased Family Stress: With the pandemic causing economic instability and job loss, family stress levels have increased. Higher levels of family stress can lead to increased anxiety and depressive symptoms in children and adolescents.

Understanding these factors is crucial for creating strategies to address the mental health crisis among students during the COVID-19 pandemic.

Conclusions
The COVID-19 pandemic and the subsequent government-imposed lockdowns and closures have had a profound detrimental impact on education at all levels in Canada. Although the government and public health stated that these measures were implemented to protect public health, they did not appear to have properly considered what would most surely result from the significant disruption in the educational system. Students of all ages, from primary grade children to university students, have faced unparalleled challenges, including but not limited to social isolation, mental health issues, disrupted routines, and delays in academic progression.

Government actions did not fully account for the wide-ranging impacts these measures would have on the education system and the students it serves. The sudden transition to remote learning highlighted and exacerbated existing inequalities, strained resources, and put enormous pressure on both students and educators. It is essential to recognize that the impacts extend far beyond academic achievement and have deeply affected students’ mental health and overall wellbeing.

Similarly, universities and colleges imposed their own lockdowns and restrictions, which caused them to shift to virtual learning environments and dismiss students who refused or were unable to comply. The loss of in-person interaction, networking opportunities, access to campus facilities, and delays in academic progression all contribute to a vastly altered and often diminished university experience.

Moreover, teachers’ unions—facing a perceived change in working conditions, mounting pressures regarding teachers’ safety, and the challenges of remote instruction—played a role in reinforcing the need to implement the unnecessary lockdowns and closures during the pandemic. The unions’ actions and advocacy for teachers’ “rights and resources,” seemed ill-considered and appear not to have taken into account the actual data that was available as early as March of 2020.
Recommendations

A. **Avoid Prolonged School Closures**: Recognize that extended school closures should not be imposed in the future, as they have profound and far-reaching negative impacts on the socialization and education of children.

B. **Prioritize In-Person Learning**: Ensure that in-person learning remains the primary mode of education, even during public health crises. Remote learning should only be used as a last resort and for a limited duration, and in conjunction with parental consultation.

C. **Data-Informed Decision-Making**: Base any decisions related to school closures on comprehensive and up-to-date data, considering the specific needs and circumstances of each region or community.

D. **Support Vulnerable Populations**: Develop targeted support systems for vulnerable students, including those with disabilities and students from low-income backgrounds. Recognize that these populations may be at higher risk than the general student population and provide specific measures to protect them. Do not impose these measures on the entire student population.

E. **Enhance Mental Health Services**: Invest in mental health support services within schools to help students cope with the emotional toll of the pandemic and the challenges of social isolation.

F. **Prioritize Social and Emotional Learning**: Incorporate social and emotional learning into the curriculum to help students build resilience and emotional intelligence, especially in the aftermath of the COVID-19 pandemic.

G. **Maintain Transparent Communication**: Keep parents, students, and the community informed with clear and transparent communication regarding the reasons behind any decisions related to school closures or restrictions.

H. **Plan for Crisis Scenarios**: Develop contingency plans that prioritize education and socialization, while maintaining health and safety during future crises.

I. **Learn from Past Mistakes**: Conduct a comprehensive review of the government’s response to the COVID-19 pandemic in education, and use the lessons learned to shape future policies that prioritize the wellbeing and education of our children.

By implementing these recommendations, we can work towards a future where our education system remains resilient in the face of emergencies, ensuring that our children’s socialization and development are protected and nurtured.
7.2.6. The Restructuring of Traditional Educational Institutions due to COVID-19 Measures

Introduction

Historically, most stakeholders in education were motivated to fulfil their teaching responsibilities within the pedagogical framework and curriculum outcomes required to meet societal needs. More recently, the focus of student learning moved toward global interconnections and the need to ensure citizens from all walks of life acquired sufficient knowledge to meaningfully participate in globally aligned industry. For the most part, being introduced to integrated and interconnected global communities was not a hindrance. Student needs were primarily met, and learning opportunities that empower and educate students were fulfilled. In essence, student achievement and critical thinking accompanied by related buzz words was the goal. That is, until COVID-19.

When COVID-19 came along, global aspirations were shut down. Barriers to the world as we knew it were imposed. A new set of boundaries were erected, with COVID mandates leading to new societal norms. This included learning institutions as well. Depending on where one lived and the type of school one attended, the governing mandates for education became vastly different. In-person class learning was abruptly stopped and replaced almost as quickly with online or distance learning, or some form of hybrid instruction.

In the beginning, mandates were temporary, such as the two weeks to flatten the curve. Over time, more permanent lockdowns and restrictions were legislated by authorities. Consequently, students in the K–12 system had their social circles curtailed. Recreational parks were closed. Family gatherings were restricted, and students of all ages (as a demographic within a broader societal construct) were seriously disadvantaged.

At the post-secondary level, students faced similar consequences. Higher education took a sudden U-turn from scholarly inquiry, research, and investigation (under the umbrella of academic freedom) into a mandated environment of conformity, intolerance, and discrimination.

Accordingly, universities abandoned the foundation of learning for the betterment of society—in favour of institutional compliance, whereby senior management, boards of governors, and university presidents responded favourably and with vigour to government dictates. Ivory towers (widely accepted as the think tanks within society) mimicked layers of government bureaucracy, submitting to ever-changing whims of health authorities. To say the least, the results were destructive. Instead of the arts, humanities, and social sciences playing a formative role in shaping public policy, society as we knew it was under siege.

Certainly, the damage to education—and, by extension, the social fabric—was massive. Serious gaps in student development, academic rigour, relationship-building, and curriculum outcomes were sidestepped, eclipsing the prevailing COVID narrative into every aspect of instruction, administration, and student interactions. Teachers, staff, and students alike felt the burden of repeated COVID messaging—hand sanitizers, social distancing, curtailed speech—all the while, the continued introduction of even more nonsensical protocols.
In the aftermath, the Canadian public has seemingly ventured into territory for which we are ill prepared to understand. Some suggest the playbook is George Orwell’s *1984*. Others claim the attack on Western democratic ideals is much worse. Regardless of where one stands on COVID itself, there are outstanding questions requiring meaningful answers. For example, how did an educated free and democratic nation get here and where is society going?

Herein, you will hear witnesses testify of the real harms caused in the education sector over the last three years: the disparity, the derogatory and very public shaming, the humiliating treatment by colleagues, the increasing polarization at every juncture, job losses, the human casualties, and the outright rejection of constitutionally protected rights and freedoms. You will hear from parents whose lives have been tragically changed forever. And teachers forbidden to do what they loved to do—instilling knowledge and confidence in our youth. And one strong lady, who in spite of her personal circumstances, tried to educate others on the harms to children.

Each testimony is a real-life story representative of thousands—perhaps hundreds of thousands—of citizens who witnessed firsthand the moral turpitude by culpable people with no authority or jurisdiction to govern but who did so anyway. Clearly, boundaries were broken. The question is whether society is worse off now than we were pre-COVID.

**Analysis of Witness Testimony**

What was the intention of the COVID-19 measures undertaken by the governments? In many ways, the Milgram experiment⁴⁰ could be rightly considered a microcosm of COVID measures, except that COVID was unveiled on a global scale. Nevertheless, the mandates appear to have little to do with COVID. In fact, as many witnesses allude, an era of uncertainty was ushered in, and the very institutions established to protect citizens failed miserably. In this context, Orwell’s repressive doublespeak comes to mind, where truth and facts are replaced with negationism.

As witnesses attested, valuing one another as human beings was no longer the embraced societal underpinning. And the consequence that evolved was that power for the sake of power became the overarching and multi-layered system where contrary voices were shut down. Citizens’ consciences and convictions were systematically manipulated or rejected, by the stroke of a pen, not only by governments and health authorities responsible for COVID dictates but also non-rational intolerance for our neighbours became equally entrenched in academic workspaces.

At first the events seemed isolated. But over time, a bullying mindset accelerated within communities. Authoritarian and judgmental attitudes became prevalent. Ironically, in hindsight, we perceive it to have been a very odd conception of power that emerged. People with even limited power to control others felt self-justified approval to abuse and harass our colleagues and peers.

---

Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

In a logical world, where unjustified fear and threats against citizens would never be tolerated, the idea of individuals seeking power over others would be suspect. But it happened. Thus, has society become transactional? Is every interaction with others no longer privy to compassion?

The trickle-down effect meant individuals seeking empowerment and control over others in their own small corner of the world could rationalize their aggressive behaviours because of the even higher state hierarchical powers ordering blind compliance imposed upon them.

Rule-making authority then, as Prof. Bruce Pardy testified, is not emanating from legislatures passing statutes whose purposes are for the good of society but, rather, delegating rule-making authority to administrators, regulators, boards of governors, and corporate entities. The consequential ramifications, as witnessed throughout COVID, is that “individual autonomy must yield to the expertise and authority of officials acting in the name of public welfare.” As also stated, when officials are given the authority to override individual autonomy, bad things inevitably happen.

From an education perspective, values of kindness and empathy should have determined the treatment of all stakeholders within congregant settings, and most particularly those environments where relational bonds are forged. Why? Because when education is successful, both teachers and students learn because their spirit and willingness to serve others is prioritized.

Instead, these scholarly, well-learned individuals operating in various capacities within educational institutions caved to the whims of bureaucrats acting outside the democratic models exampled in public policy literature. By virtue of their academic achievements alone, these officeholders should have recognized that governments have always been poor proxies when it comes to acting in the best interests of the populace. Further, as testified to as well, when governments try to achieve more complex goals with detailed data, it tends to choke on its own ineptitude. In other words, the idea that governments could handle any pandemic should have raised red flags throughout academia. The very basic understanding that infighting among bureaucracies increases immensely as the totalitarian goals of making all that is private a part of the public realm should have caused concerns.

Still, there is yet another boundary that has been damaged. That is, our moral God-given rights and freedoms were not just stretched, to determine at what point citizens would object to further demands, but broken. Not just entangled for a short period of time but ripped apart, leaving the social fabric worse off than before. The sheer number of perplexing issues that emerged, including how quickly universities and colleges took hold of discretionary powers and implemented institutional mandates and lockdowns on campus—even while health authorities were still only recommending cautionary practices—should have shocked the populace. The fact that some refused to lift mandates after health authorities did should be equally concerning.
And then there was censorship. The experiences of Mr. Marazzo are a prime example. Mr. Marazzo worked as a combat engineer for 25 years. He holds a bachelor’s degree in software and a master’s degree in business administration. He was teaching a College when the pandemic hit. Just prior to the start of the school year in 2021, the dean of the college sent out an email threatening termination if the faculty were not vaccinated. Mr. Marazzo responded by sending legal information to approximately 200 employees. Almost immediately his colleagues proceeded to publicly shame him by flooding his inbox, while ignoring the contents of his email. Shortly after, he received a termination letter. At the time of his testimony, he was living off his savings.

Those witnesses who had chosen not to comply were ostracized. Ms. Repo, for example, experienced this personally when she attempted to go about her day-to-day life after receiving a devastating terminal medical diagnosis. Her legitimate mask exemption was never honoured. At times, she was told by hospital staff that her mask, which caused breathing problems, needed to be repositioned. The only glimmer of hope was an oncologist who, for a brief moment, behaved compassionately by giving her a hug. At every other juncture—whether the orders to comply with masking came from a transit driver, restaurant server, or radio host—she was a target of hostile verbal abuse, to the point where she constantly worried whether her attackers would come to her home.

Although Ms. Repo was not an educator by profession, she was concerned about those with breathing or hearing issues and, similarly, the long-term effects of masking on children—so much so that she made a presentation on these harms to the City of Saskatoon, which was essentially ignored.

Yet Ms. Hunter, an early childhood teacher with over 20 years of experience, confirmed Ms. Repo’s masking concerns. Ms. Hunter stated the impacts of masking included difficulty breathing, hypoxia, high levels of carbon dioxide, increased heart rate, and high systolic blood pressure. Clinical symptoms of mask wearing include headaches, fatigue, shortness of breath, skin conditions, psychological effects, cognitive difficulties, and dizziness. High levels of CO₂ reduce blood pH, which may lead to long-term complications such as cancer, diabetes, dental issues, and neurological disorders. A person wearing a mask is not supposed to touch it, or the mask is considered contaminated and must be thrown away.

Other concerns include bonding and attachment, particularly if the adults nursing or bottle-feeding an infant are masked. Eye contact and voice recognition (especially a mother’s or father’s voice, or that of other family members) are foundational for socioemotional growth, including passive and active communication. Young children, such as those in preschool settings and daycares, learn communication through imitation and therefore need to see people’s facial expressions to understand the nuances of human communication.
Ms. Garrett’s focus was teaching English as a second language to refugees and newcomers. Earlier in her life, she had suffered a vaccination injury, so when COVID vaccinations came along, she decided against taking any more. When in-person classes resumed, the school administrators forced her to get an antigen test to enter the building, even when there was no one else there. She said students who were not double-vaccinated were no longer allowed to attend. Also, as an aside, she mentioned bimonthly staff meetings were all about promoting the COVID agenda. She pointed to the Nuremberg trials and the lessons we all should have learned from history. She was not the only educator to experience these behaviours.

Ms. Barreda, a grade 7 teacher at an Aboriginal reserve, similarly chose not to get the vaccine. Her employment contract was terminated, and her daughter was forced to leave the school. She filed a human rights complaint, but it was denied. Online learning led her daughter to feel isolated and depressed. When Ms. Barreda reached out to the band council for answers, her questions were ignored. She said she tried to follow the science, but it only led to money—not science.

Medical reasons were also a concern for Ms. Careen. A teaching assistant in Newfoundland, she described what it was like to be diagnosed with Guillain-Barré syndrome, and not be vaccinated. As a result of her decision, she was placed on an unpaid leave of absence. She was further denied employment insurance benefits. The lack of her income in the family caused severe financial stress. She said all of her attempts to be heard were ignored.

Another teacher, Ms. Murray, was teaching a grade 1–2 class at a private school when COVID mandates were announced. She had received a legitimate mask exemption from her family doctor, which she said was initially honoured by school administrators. At some point, the work environment changed, becoming more hostile. School faculty meetings became more focused on how to police COVID protocols rather than education standards. She indicated teaching had become much more fear-based.

Ms. Murray observed how the rules had affected children. Students experienced developmental delays, including loss of tone of speech, smell, and taste. To compensate for the delayed development, she had to continually seek innovative ways to introduce the rules without the threat of fear.

Because she was not vaccinated, Ms. Murray’s lesson plans had to be given to a substitute teacher. As time went on, she was eventually informed that the only way she could return to the classroom was if she wore a microclimate helmet. She eventually had to leave. The emotional stress in the work environment led to Ms. Murray seeking a psychotherapist for support.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Ms. Geml also testified as to the hardships she and her family experienced when she was unable to wear a mask. Beyond the fearmongering in the community, the family was also restricted from attending funerals or hospitals. Her daughter experienced additional harassment. She was subject to teachers calling the unvaccinated ‘murderers.” She was banned from school activities and friends’ homes. The school principal told her she was lucky kids like her were able to attend school. Ms. Geml said her daughter often came home from school in tears. She questioned how society had reached the point where we have become so cold and cruel to people. Ms. Geml was not alone.

Ms. Travis, a mother of six, could not watch her son play sports. Her children missed dental appointments. The father of her newborn could not be part of the new-baby experience because of his vaccination status. She lost her employment between pregnancies, resulting in severe financial hardship. Ms. Travis said she would like to see more accountability and transparency at all levels of government because it is we, the people, who pay the bills.

Students with special needs did not fare any better. As teacher Ms. Burns testified, she found it difficult to watch children with behavioural needs and severe learning disabilities respond to COVID protocols. Masks, in particular, led to students’ difficulty in breathing. She saw the children become emotionless because they were not able to express themselves. As well, some children worried about contracting and spreading COVID. There were arguments among teachers and students when the students’ parents were not in favour of masking.

Ms. Burns had a medical accommodation declined by her employer. She offered to submit to daily testing to maintain her teaching position but was denied. She was placed on unpaid leave. As a result, she is no longer a rule follower. The family has had to move from the community. She has lost friends. The mental health of her family has been impacted. She is troubled to have been categorized as a misogynist and racist due to her personal medical choices.

Ms. Howland’s testimony corroborates Ms. Burns’ experiences. Ms. Howland is an educational assistant, working with special education students with Down’s syndrome, ADHD, and other learning disabilities. She could not speak freely about her adverse reaction to the vaccine. Her professional life has been negatively impacted, as she now struggles with background noise. She currently works primarily on literacy with students, but her hearing loss has greatly affected her ability to perform her job.

Mr. McDougall was passionate about children. He had worked for 13 years in childcare settings. His son was born the very day the pandemic was announced. In April 2020, the daycare was closed to the children. He spent time helping with groundskeeping and facility maintenance projects within the community. He said everything changed sharply in October, when cohorts were formed. At this time, the children were separated into groups. Mask mandates followed. Mr. McDougall took great exception to masking, not just for himself but for the children too.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

He had been working with an autistic child for years. Before COVID, the staff were very excited about the child’s progress with his peers; he had reached a relatively normal level of functioning. Once the masks came in, he regressed. In fact, he became very aggressive and violent toward staff. Mr. McDougall said facial recognition difficulties were an issue. He said he could not stand seeing what was happening to special needs children. Eventually, he left his position.

Families with special needs children experienced difficulties as well. Ms. Smith had a 28-year-old son with minor special needs and a 24-year-old daughter with Down’s syndrome. Pre-COVID, her daughter attended a full-day program for disabled adults. The routine of the program was very important to her daughter. Because her daughter underwent heart surgery at 10-weeks-old, her mental and emotional states were impacted more than the average child’s. When the program was closed due to lockdowns, Ms. Smith observed signs of depression in her daughter. Although the day program has since resumed, her daughter was still affected, fearing the program could be cancelled again.

Ms. Tabak shared the story of her son Kyle. He had an accident that left him with a brain injury. By 2020, Kyle was living on his own and working. He decided to return to school, but his cognitive issues remained a challenge. He was required to complete a lengthy and very personal questionnaire with a psychiatrist to continue with online learning.

When Ms. Tabak and Kyle went to his appointment, the psychiatrist was not there. This did not help her son’s wellbeing. Kyle was told to go through telehealth. Throughout COVID, he bought into the narrative. He became fearful, and he reduced his work hours. One day Kyle called to say he had no groceries. Even so, Ms. Tabak said the last conversation with Kyle went well.

However, Kyle called 911. Sadly, when the emergency responders arrived, he was already deceased. Kyle had written apology letters to both the RCMP and EMS. He had also written an apology to each of his family members, explaining his anxiety and depression. Ms. Tabak said the family was able to donate Kyle’s organs so that potential transplant patients waiting for organs could be helped.

Kyle was not the only young person who did not know where to turn. The day before her 20th birthday, Danielle Galvin also took her own life. She was a second-year student at a Canadian University. Earlier that same week, two other students also died by suicide. They all would have been in grade 12 when the lockdown measures were first put in place.

Danielle’s mother, Ms. Galvin, recalled the deadline for Ontario students to accept offers to attend university. Once an offer was accepted, all other offers on the table were rescinded. The University of Guelph said it would keep its residence open. This was a major factor in Danielle choosing Guelph over Western. Two days later, the University of Guelph reneged on its promise, throwing thousands of students’ plans into chaos.
Ms. Galvin, along with other parents, contacted school administrators. They were informed that the Wellington-Dufferin-Guelph health unit had conducted an inspection and, therefore, would only allow a few students into residence. The university did eventually allow foreign students into residence. Ms. Galvin was informed by the Minister of Colleges and Universities that the ministry does not interfere in the operations of colleges or universities.

Further, the University of Guelph administration did not mandate professors to deliver virtual lectures. In Danielle’s case, this meant four out of five professors in her first-year class did not deliver a single lecture. In November 2020, Danielle attempted suicide but was found by a friend. Ms. Galvin and Danielle’s sister rushed to the hospital, but neither was permitted entry. The doctor said this was because Danielle was 18-years-old and was considered an adult.

By Christmas 2020, the provincial government advised people to isolate in bubbles, so Ms. Galvin and her two daughters spent Christmas together, without extended family. During the winter of 2021, Danielle had moved into a townhouse. Ms. Galvin observed the Ontario government was still allowing regional health units to dictate mandates, so the rules differed across the province. At the university, the campus police patrolled the grounds constantly looking for students who were violating the rules. Danielle and four of her friends were issued $880 fines.

To attend school in September, students were required to be vaccinated. Ms. Galvin and her two daughters were vaccinated. In-person classes were resuming, but as Ms. Galvin pointed out, Danielle’s mental health had greatly deteriorated. In January 2022, the province was locked down again for two weeks, despite all the students being vaccinated. Ms. Galvin implored the University administration, the MPP, and the Ministry of Colleges and Universities to allow the students back into schools.

She cited research from the Canadian Paediatric Society warning that the risks to students were far greater if they were not allowed back into school. On January 17, 2022, the University of Guelph called a snow day, even though students were learning virtually. It was this same week that Grace died by suicide. A few days later, and still waiting to start post-secondary school, Sayuri died by suicide. A few days after that, Danielle died by suicide. None of these young women knew each other, but they were all so despondent after almost two years of punishing lockdowns and restrictions that greatly disrupted their lives. Ms. Galvin believes that these academic and social disruptions were a major contributing factor in the breakdown of their mental health and eventual suicides.

Other concerns came to light. Witness Gary Bredeson, an Alberta resident, had three adult children attending post-secondary schools when COVID hit. He said the boys had become quite sick following Christmas break. By March 2020, post-secondary schools in British Columbia had moved to online. He became concerned over the difficulties of the boys completing online courses in the basement. Mr. Bredeson said the increased costs for a lower level of instruction, plus the cumulative social effects of being shut out of the social fabric, weighed heavily on the family.
In another example, Mr. Paquette studied medicine at Sherbrooke University prior to obtaining a bachelor’s degree in elementary and preschool teaching. He communicated regularly with pediatricians, public health physicians, and others. In his opinion, the pediatricians had either been silenced or had chosen to remain silent. He said the notice from the Association des Pédiatres du Québec (APQ) at the start of the 2021 school year was ignored by public health and the government, which collectively chose not to publicly defend the precautionary principle for children. Mr. Paquette concluded the COVID measures were disproportionate and detrimental to children’s development. In Québec, he said the data was misused, creating instead an unwarranted fear that led to the populace accepting the measures.

Post-secondary students did not have a voice either, as evidenced by Ms. Vossen. An in-house graphic designer, she had one course remaining to graduate. In August 2021, she was notified that all students attending classes in person required a COVID vaccination. She did not believe it affected her because her course was online. Later, the course was dropped.

She expressed concern to the president of the College, stating, “On behalf of a group of concerned students, I would like to see the data.” The College retracted the mandate, and she requested an in-person meeting, which was denied. Soon after, she opened an Instagram account called Students Against Mandates, using her graphic design background. She received thousands of messages from students across Canada. Many contained stories of their own personal experiences with employers, administrators, and school authorities.

Ms. Vossen said the response from the freedom community was very positive. However, she had a hit article written against her. She was called an “alt-right extremist” and a “Nazi.” The article brought her family into it. She observed threats and rude comments on Reddit, Twitter, Facebook, and Instagram. All of her previous friends cancelled her.

With her educational status in limbo, Ms. Vossen had no intention of returning to an institution that discriminated against her. The positive was the strong support system she received from so many others facing similar predicaments. She said, “Throughout history, we have seen that ‘doing it for the greater good’ leads to nowhere good.”

Mr. McCurdy, an elementary school teacher in Ontario for more than two decades, brought a broader perspective. He said schools were in lockdown for 28 weeks. He discussed the challenges of remote learning within the context of students who did not have access. He pointed to attendance in his own grade 7-8 classes, which dropped to 50-60 per cent of pre-COVID numbers.
He indicated the expectations for students to pass was very low. For those students who did attend and participate, the quality of learning he was able to deliver was drastically diminished. Students lost all their extracurricular activities and opportunities to socialize, which are critical aspects of school and childhood development. In terms of the learning environment, Mr. McCurdy recalled seeing fellow teachers yelling at children to put on their masks. During mandates, children were not allowed to talk to each other while eating. He also noted that since the pandemic, it was very common to have multiple staff off on any given day.

The consequences of COVID policies and measures were already evident in the system. There were immense deficits in children’s learning skills, resiliency, coping skills, problem solving, and confidence levels. He admitted many more children were further behind academically, with some lacking basic reading and writing skills. There was also a much higher prevalence of conflict and violence in schools.

He said he spent more time giving extra help to students than ever before. School attendance had not returned to normal. His other concern stemmed from the move to replace staff with individuals who were not equipped to cope with the increase in aggression and mental health issues. He said replacing educational assistants with paid volunteers to help with children created safety issues.

He was also disappointed that no one at the school board or provincial level acknowledged the negative effects from lockdowns. He believed a cost–benefit analysis of these policies should have been done. He further believed the analysis must include public input and consultations, because we as a society should be working to protect our children. He called the potential damage we have done, “mind-blowing.”

Mr. Studin, the chair of the Worldwide Commission to Educate All Kids (Post-Pandemic) and president of the Institute for 21st Century Questions, raised similar concerns. He coined the term “third-bucket kids” for the students who are neither in physical nor virtual school and are now receiving no schooling whatsoever. Mr. Studin believed most Canadians assumed that all children who were not in physical school had transitioned to virtual learning. This was not the case.

He also said many children did not have the physical or financial resources, such as Internet access, to complete virtual learning. Others did not have in-home support that could have alleviated language barriers, learning disabilities, and unsafe or abusive situations.

Mr. Studin admitted the initial school closures in early 2020 could be called a policy mistake and possibly even be forgiven. However, school closures after this time were policy crimes. He said any intelligent society should have understood there would be massive—indeed, catastrophic—consequences to closing schools for so long, leading to great destabilization when these same children become adults.

His international colleagues do not understand how Canada failed so badly. He continued by saying, “We now understand that it is central to always keep schools open, not just for the wellbeing of children but for the proper functioning of the society.”
Mr. Allen concurred. He said lost educational opportunities will have long-term consequences. As a professor, he could speak to the lost opportunities at the university level. Low education equals lower wages, poorer health outcomes, and decreased life expectancies. If one calculates the value of lost lives, it swamps any benefits from the lockdowns. Factor in the increased family breakdowns, suicides, and supply-chain interruptions and, simply put, it was going to take a generation to find out the actual costs of COVID.

From a public policy perspective, Mr. Leis had stated that Canada is guided by the principles of classical liberalism, which have an extraordinary history related to the assumption that we are born free. Within this framework, we have governments to serve us, but these same governments are not above the law. Therefore, to lock down a society because of COVID is outrageous: the economic, social, educational, and health consequences of this are astronomical. He said we underestimated the reason we have a limited state. Mr. Leis reiterated that classical liberalism is foundational to Western society.

He said freedom of speech allows us to debate and get to the truth. It is also the cornerstone for our standard of living and technological advancement. If we have censorship and the imposition of the state telling us that facts are not facts or that the end justifies the means or that we must follow the science but not in the name of science, we do not have a future. He pointed to lessons that we need to learn.

First, debate is essential (like intellectual friction). It is amazing what we can learn from those who disagree with us. Second, as our society moves closer to authoritarianism, the logical fallacy of never attacking one’s opponent personally has become more prevalent. Third, in a healthy society, the state undertakes the judicial function to ensure the rightful implementation of law. There are no arbitrary arrests. Therefore, for all these reasons and more, COVID was a policy disaster. But not only a policy disaster; rather, also one where civil society was utterly assaulted.

Indeed, tyranny is simply unfettered discretion, Mr. Leis said, and it is happening in public health and, by extension, our politicians. For the direction of this great nation to change, it will require more than the voices of a few. It is time to stand and proclaim, “No more.” Or as Jordan B. Peterson put it, “We hurt the educational opportunities of children and failed to see that the reaction to a crisis can be worse than the crisis itself.”

Conversely, there was a very tiny win. At the University of Calgary, where there is a large Christian presence, lawyer James Kitchen successfully appealed the denial for religious accommodation for approximately 200 students. Initially, the accommodation requests were denied, with only a few students able to get one. He said the denials appeared to be completely arbitrary and that no one seemed to care about the law. After the appeal, all the requests were granted. He supposed, before COVID, there was some respect for the law. But Mr. Kitchen could only conclude that this was moral depravity, and perhaps fear, to the point of not being rational anymore.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

As a whole, the personal and professional testimonies within, as excruciating as each might be, offer a glimmer of hope. That going forward, we will all come to recognize that the only real opposition to illegitimate institutional powers, bullying and coercion by unelected puppet masters, and fear-incited dictates and penalties, lockdowns, public shaming, and censorship is when Canadian citizens come together collectively and demand that the public service, mandated to serve the citizenry, actually does.

Recommendations

A. **As publicly funded institutions**, both universities and colleges must adhere to the law of neutrality before demanding compliance for policies that potentially may not be legally enforceable.

B. **In all publicly funded institutions**, whereby the mission includes scholarly inquiry and academic freedom as institutional tenets, there must be room for dissenting voices, debate, dialogue, and, most particularly, policy revisions when the evidence points to a change in the data and statistics that led to restrictive policies initially.

C. **There must be a cost-benefit analysis** of any policy that leads to school closures, and discussions must include the public and education stakeholders.

D. **In the interest of academic freedom and integrity**, post-secondary institutions and faculty should be able to ask pointed questions free from any fear of repercussions.

E. **Investigate scientific findings** that contradict the narrative, and provide internal grant funding to ensure the evidence relied upon by governments and health authorities is accurate.

F. **Post-secondary institutions** should not be allowed to impose additional mandates or extend mandates beyond that imposed by the government regulators. During the COVID-19 pandemic, once the initial two-week to flatten the curve period had concluded, post-secondary institutions should have lifted all policy restrictions. Similarly, when the emergency orders were lifted, post-secondary COVID policies should also have been terminated.

G. **Offer an array of learning platforms** and alternative arrangements for academic study, including in-person classes, and online, distance, and hybrid options.

H. **Ensure all students have an opportunity** to reach their potential without discrimination or bias due to vaccination status.

I. **Any faculty or staff member who suffered a job loss**, was terminated, or was placed on unpaid leave and subsequently barred from campus should be immediately restored to good standing. Additionally, any negative or potentially stigmatizing comments regarding the employee’s COVID stance should be removed forthwith from that employee’s files. Pensions should be fully restored to pre-COVID status.
J. **Post-secondary institutions should focus** on student achievement and not the removal of students from programs for not being compliant with newly established vaccination policies. No student should lose academic standing or lose successfully completed academic credits for non-compliance to a policy.

K. **Students in residence should have opportunities** to socialize with other residents under the auspices of cohorts. Students should never be restricted to their rooms.

L. **Reimburse students who paid for residence** in good faith but because of a change in COVID policies combined with an individual’s unvaccinated status, were forced to vacate the premises.

M. **Accommodation in accordance with the Charter of Rights and Freedoms** must be made. It is a constitutionally protected right for all persons. Therefore, faculty, staff, and students requesting accommodation should not only have their concerns heard but taken seriously when blanket COVID policies are initiated. This includes accepting medical, religious, and personal exemptions. It also means consideration for other circumstances, including personal choice, convictions, conscience, deeply held beliefs, or health risks (for example, previous adverse reaction to a vaccine).

N. **Health policies should provide allowances** for bodily autonomy and personal choices. Employees and contractors—including faculty members, staff, and students—should not be required to disclose their medical information to obtain an allowance.

O. **Policies that lead to the segregation** of a specific group of students is discriminatory. Therefore, any policy promoting segregation must be immediately removed.

P. **Post-secondary institutions** should have to provide justification in writing for responding to government mandates with inflexible approaches.

Q. **Any policy must be subject to revision** when it becomes apparent that restrictions are not necessary. For example, there should be a mandatory review process every 30 days.

R. **Meet with stakeholder groups—including faculty**, staff, and students—who made different choices regarding vaccines and COVID policies.

S. **Eliminate all policies and procedures** that directly violate human rights legislation, including denial of a service or services.

T. **Employment loss and/or disciplinary action** (including unpaid leave) must follow the same human rights procedures for all faculty and staff. Vaccination status should not be a sufficient excuse or justification for applying union procedures differently.

U. **A union’s mission is to protect and defend the rights** of staff and faculty across campus. The union does not have the right to arbitrarily deny unvaccinated staff and faculty the right to file a grievance and to have the grievance heard.
V. **Employees with long-standing service** should not suffer a loss of pension and other benefits because of personal health choices.

W. **Third-bucket youth** who were not educated during the pandemic need to be found and their circumstances addressed so they can be educated and subsequently prepared for the future.

X. **Schools should not be closed** for periods of time exceeding one week in duration.

Y. **Virtual schooling is not advantageous** to youth experiencing learning disabilities, having language barriers, or living in an unsafe or abusive situation. These additional barriers to learning need to be taken into consideration.

Z. **Young, healthy people should not be shut out** of schools for as long as they were. Studies as early as May 2020 showed that suicides, eating disorders, opioid deaths, and substance abuse were skyrocketing among young people. Students should have been allowed to go back to in-person learning with no more interruptions.

AA. **Special needs children and adults** require additional guidance and direction. Therefore, one-size-fits-all blanket policies need to be reconsidered.

BB. **Public shaming and labelling of citizens** by government officials contributes to lawlessness. Government officials and those in positions of authority need to be held to a higher standard. At the same time, governments should not be permitted to blatantly work against their populations.

CC. **Educators need to publicly defend** the precautionary principle for all children and youth.
7.2.7. COVID Impact on the Social Fabric

When describing COVID’s impact on Canada, the question really comes down to this: Where to begin? Certainly, the tiny cracks in the social fabric may have surfaced pre-COVID, but in the aftermath, these splinters have become deep crevices. Regardless of where one turned, the threat of even further damage was frightening.

At the beginning of COVID, the prevailing narrative was “two weeks to flatten the curve.” Most of the citizenry at the time understood that a pandemic could pose a very real threat. Thus, for the most part, the majority of Canadians were willing to concede to a temporary shutdown for the sake of society as a whole. But what happened when two weeks became two months? And two months, two years?

Some argue COVID is multifaceted and complex. Decisions were made with the goal of protecting public health and safety. Any criticism, even constructive commentary, was quickly dismissed, and dissenters outside the one-sided, prevailing narrative were silenced. Nevertheless, pointed questions needed to be asked. Perhaps the most pressing question: Were the governments and the public service honest with the Canadian people?

Traditionally, when a nation comes under siege from outside forces, its citizens unite to defend the country’s interest. However, the response to COVID and the federal government’s invoking of the Emergencies Act appeared to garner the opposite response. Instead of rallying together in one accord, with a determination to save Canadian ideals, citizens willingly complied with ever-changing health mandates, even when these bordered on the nonsensical. Indeed, mask-wearing, social distancing, and experimental gene therapy tended to be accepted as the price for participating in society.

In actuality, it could be said that Canada’s COVID policies brought out the worst in people. The sense of defeat was palpable in the hearts of men and women on the streets. Hope and optimism for the future was not generally observed within the populace. For many Canadians, there were simply too many hurdles to overcome, so they compromised both principles and conscience just to survive.

Subsequent research points to the negative developments that have permeated nearly every aspect of Canadian society. While, admittedly, a multitude of factors influenced the advance of the pandemic, it would be remiss to think, after hearing the witness testimony, that ulterior motives were not at play.
Inquiry into the Appropriateeness and Efficacy of the COVID-19 Response in Canada

The witnesses alluded to a variety of societal breakdowns, and the irreparable damage that followed in the aftermath of COVID dictates. It is important to recognize the burdens placed on people from all walks of life, journeying within multiple layers of society, because the long-term effects of COVID mandates are intergenerational. In fact, as stated, it could be generations before the harms committed over the years 2020-2023 can be undone, or perhaps they can never be undone. Noticeably, lawlessness increased, but not from the citizenry. Rather, the wrongs that were being committed stemmed from all levels of government officials—the few that believed they knew much better than the populace.

For example, the rule of law, wherein the same application of the law applies to the homeless on the street as the judges dressed in robes in the Supreme Court, has been violated. The supremacy of God was sidestepped. Constitutional rights and freedoms were discarded as if these protections never existed. In many situations, ordinary people who stood for this country, have fallen. Normal day-to-day lives have been damaged. Education and learning opportunities for young people were disrupted.

Medically, suicides, addictions, and domestic abuse increased at phenomenal rates. Adverse medical effects from COVID injections were not accepted by health agencies, even though medically qualified, professional physicians attested to the vaccine injuries to patients. Scientists who contested the prevailing narrative became outcasts. Family businesses were destroyed because these were not considered essential. Neighbours forgot how to trust one another. In its wake, a host of economic, social, health, legal, and public policy tragedies have yet to be acknowledged by the authorities responsible.

One outcome is definite. We are not the same society we were before COVID. Many questions remain. These should include whether the populace is satisfied with the emergence of a new political model that, in essence, replaced all the tenets of parliamentary democracy and justice in Canada. Certainly, the idea that legislators (in consultation with the electorate) no longer decided our destiny during COVID—where Canadians shop, whom citizens befriend, the beliefs and opinions people subscribe to—should have been concerning enough. But appointed (non-elected) health authorities and public service employees, who with the stroke of a pen can further impose predetermined restrictions on one’s conscience and arbitrarily decide where one’s inherent rights to live as free men and women should start and stop, should raise serious alarms. Is this the society Canadians want?

How Did We Get Here?
The reality is the elected officials vacated their posts and instead, abdicated or gave over their respective political and public administration responsibilities to chief medical officers employed as bureaucrats within public health. Equally notable, these individuals were also allotted extraordinary powers that clearly went beyond the scope of good governance and accepted democratic
principles. Therefore, in this specific context, did the actions of chief medical officers and corresponding health bureaucrats border on the political doctrine and practices recognized in political science circles as absolutism.⁴¹

After all, this didn’t just happen in one province, or even within Canada. The one-mind that emerged occurred in most jurisdictions around the world. The Western ideals that Canadians had come to cherish were extinguished by the stroke of a pen. But whose pen? Who decided that the rights and freedoms of citizens no longer mattered in Western democracies? And why, in such a blessed democratic nation as Canada, did so many blindly follow?

As the numerous witnesses alluded to while sharing their personal testimonies, ordinary citizens were arrested and detained in prisons for standing firmly on the rights and freedoms established in the Constitution Act, 1867; the Charter; and the Bill of Rights. Where was the presumption of innocence? What happened that negated the administration of justice?

The questions do not end here. For the three COVID years, the ever-changing mandates differed, depending in which part of Canada one lived. Language changed. The legacy media suddenly became experts in public health, without ever attaining a medical degree. The content these journalists did not substantively understand translated into a word-for-word repeat of press releases disseminated by public health officials. The more bizarre the content contained in health alerts, the easier it became for media to report—for example, 8 p.m. curfews, wherein no citizens were allowed on the streets in Québec, or how travellers were required to obtain travel papers prior to entry into New Brunswick or Nova Scotia. The Atlantic bubble zone was yet another example—wherein residents in the Atlantic region could travel freely throughout the eastern provinces without question, but Canadians living elsewhere were subject to additional scrutiny and COVID preauthorizations.

---

⁴¹ Absolutism: “the political doctrine and practice of unlimited centralized authority and absolute sovereignty. The essence of an absolutist system is that the ruling power is not subject to regularized challenge or check by any other agency, be it judicial, legislative, religious, economic, or electoral.” britannica.com. https://www.britannica.com/summary/absolutism-political-system#:~:text=absolutism, Political doctrine and practice, economic, or electoral agency. (accessed 2023)
This same legacy media also gained an expertise in public shaming. Anyone who opposed the prevailing narrative and, most particularly, those with medical and scientific expertise were labelled as “conspiracy theorists,” delivering a message of “disinformation” and “misinformation.” For their servitude, the legacy media was paid handsomely by their political masters in Ottawa. Truth, investigative journalism, and professional ethics were no longer priorities of mainstream news agencies. As quickly as the government could print news releases, the media adopted them as their own.

There could not be a timelier era for the biblical prophesy forecasting when “right is wrong and wrong is right” to come to fruition. For example, the term freedom fighter, according to artificial intelligence, is subjective—meaning what one group views as freedom, another might consider an act of terrorism or insurgency. Therefore, artificial intelligence does not acknowledge freedom as an inherent, God-given right in Canada. Any responsible educational inference that willingly omits absolute truth (truth that cannot be manipulated) when constitutional tenets are already defined should scare Canadians.

Further, it appears the media, alongside federal and provincial government institutions, only resorted to historical context for villainy so they could then mangle it beyond recognition to prove a desired outcome consistent with COVID mandates. Are there even recommendations capable of countering this increasing trend toward propaganda-type reporting?

---

42 Disinformation is false information deliberately spread to deceive people. Disinformation is an orchestrated adversarial activity in which actors insert strategic deceptions and media manipulation tactics to advance political, military, or commercial goals. Disinformation is implemented through attacks that weaponize multiple rhetorical strategies and forms of knowing—including not only falsehoods but also truths, half-truths, and value judgements—to exploit and amplify culture wars and other identity-driven controversies. https://en.wikipedia.org/wiki/Disinformation (accessed 2023)

43 Misinformation: Misinformation is incorrect or misleading information. It differs from disinformation, which is deliberately deceptive and propagated information. Early definitions of misinformation focused on statements that were patently false, incorrect, or not factual. https://en.wikipedia.org/wiki/Misinformation (accessed 2023)

44 “Woe unto them that call evil good, and good evil; that put darkness for light, and light for darkness; that put bitter for sweet, and sweet for bitter.” Isaiah 5:20: King James Version, 1611.

45 Chat.openai.com, (accessed August 31, 2023)

46 Villainy: befitting a villain (as in evil or depraved character) https://www.merriam-webster.com/dictionary/villainous (accessed 2023)
But legacy media were not the only perpetrators. Social media quickly joined ranks, becoming judge and jury of all commentary that allegedly contravened community standards. Facebook, YouTube, and other social media giants censored content, disciplining or suspending privileges of any user who posted content concerning COVID. At no point did governing authorities, the judiciary, or Crown prosecutors challenge these actions by social media conglomerates, even though freedom of thought, belief, opinion, and expression clearly includes freedom of the press and other media of communication\(^\text{47}\) in the Charter.

There is also another emerging concern regarding dialogue and actions that are contrary to the Charter. Increasingly, it appears Canadians’ rights and freedoms are only concrete and tangible “when reasonable.” For clarity, there is no “when reasonable” attached to Charter rights and freedoms. These rights are inherent and God-given. These are not within a government’s purview to take away. The framers of this nation recognized and founded Canada on these pillars—the supremacy of God and rule of law. These same citizen protections were then reaffirmed and entrenched in 1982.

Further, these citizen rights are guaranteed to be free from any interference or intrusion from government agents of the state. All government institutions are expected to remain neutral, which by extension, prohibits government from selectively cherry-picking which legal activities are deemed reasonable and which are not. These same limitations on government apply to Charter-protected accommodation.

It is herein that the intersection of citizens and governing authorities requires further investigation: the COVID messaging, the forceful actions of authorities, and the question of whether Canadians are once again willing to sacrifice their individual and collective rights and freedoms whenever governments or bureaucrats impose mandates in the future.

Before garnering a response, it may be insightful to review some of the COVID measures imposed over the last three years, and how COVID mandates and government dictates negatively affected the social fabric.

A. Children were told if they visited their grandparents, grandma would die. If these same young people visited their friends, their peers could become infected. Families had to make an appointment to visit loved ones, and far too often, this included bringing the negative results of a rapid COVID test.

B. Children could not play in parks or playgrounds. Social time was not allowed.

\(^{47}\) Section 2(b) of Canadian Charter of Rights and Freedoms states: “Freedom of thought, belief, opinion and expression, including freedom of the press and other media of communication.”
C. Libraries, museums, and youth activity centres were closed. So, too, were hiking and skiing trails. Education was moved to remote or online. Student-learning expectations and curriculum outcomes were minimized. Structured schedules, so essential to those who plan their lives around them, were disrupted. This, in particular, had a significant impact on people with special needs, as the program services necessary for their health and wellbeing were shut down.

D. The gaps in access to education were even more pronounced when marginalized communities are factored in (for example, financial stress, increased worry, increased conflicts).

E. Public policies contradicted each other. For example, soup kitchens in Ontario were permitted to feed up to 50 persons in a facility at the same time, but religious services held in the very same building were limited to five or ten in-person gatherings, depending on the COVID mandate in place at the time. There was the witness who shared her story. While her mother was alive, she was not permitted in the hospital. But when her mom died, she could sit by her mother’s bedside and hold her hand. Spiritual care for a palliative patient was conducted through a window. The five children of a man who was assaulted by a disgruntled customer could not see their father before he died. There was also the heartbreaking story of one young teen who ventured down a path from where he could not return.

F. Health authorities were adamant that COVID vaccines were effective and safe, and yet after administering the vaccine to seniors living in long-term-care facilities, there were more COVID outbreaks, more COVID deaths, and presumably more adverse injury events. In Ontario and Québec, specifically, there were reports of the elderly being found in deplorable conditions. When employees walked out at one facility, the resulting circumstances were so shocking that the Canadian Armed Forces were called in to help.

G. Individuals with special needs, including learning disabilities, or mental health issues were put on hold. Countless Canadians waiting for surgeries continued their medical struggle without healthcare intervention. The elderly became even more isolated from friends and families. Many died. The short- and long-term impacts on vulnerable populations are still to be tallied.

H. The homeless, who generally find shelter on city streets and in wooded areas, were forced to find alternative ways to comply with 8 p.m. curfews because COVID measures and lockdowns already prevented them from finding a temporary warming space, bathrooms, or showers in government buildings and not-for-profit facilities.

I. Charitable organizations, including churches, were prevented from offering in-person support programs within the community. For example, Alcoholics Anonymous moved all meetings online. Temporarily, this might have been considered an acceptable compromise. However, if the persons needing AA relied on free computer usage from the library, they no longer could receive support because the libraries were closed. Ironically, the very addiction these recovering addicts were running from was still open and ready to serve.
J. Funeral restrictions were maximized, adding to the grief of family members and friends attempting to say goodbye to a loved one. Proper burials and funeral services looked very different from pre-COVID. As a consequence of the pandemic, the grief and mourning processes were disrupted, negatively affecting people’s emotional wellbeing. One witness reported that the COVID practice was contrary to the bereavement recommendations for grieving families listed on the Canada.ca website.

K. For the first time in known history, middle-aged women, typically with children still at home, were dying by suicide. The mean age of these women was 47 years old. This demographic was never identified as a risk group. Witnesses spoke of other deaths by suicide as well—of beloved ones who could no longer see the light of this day that would guide them safely into the next.

L. Mobility restrictions were linked directly to the COVID mandates in each province and territory. In larger provinces like Ontario, different rules applied depending on the health district one resided in. Internationally, borders were closed by governments. Hotels were secured as quarantine facilities for travellers arriving in Canada. The whereabouts and activities of Canadian citizens were tracked by public health agencies. Those who travelled outside of Canada were subjected to specific protocols. Inside Canada, where travel from province to province is a guaranteed mobility right in the Charter, several provincial governments imposed additional obstacles and border checkpoints. Citizens were often quarantined. Within the quarantine procedures, travellers were questioned every day by health officials. In several provinces, documentation required by health officials included a mandatory travel itinerary complete with details of overnight locations (including the names and addresses of all residents in the home) if spending time at a family member’s or friend’s home. Two examples show the length to which governing authorities would go to control the populace.

1. In September 2021, Prince Edward Island, for example: ordered anyone travelling to the province be tested, regardless of their vaccination status; recommended travellers 12 and older be tested again between the fourth and eighth day after they entered the province; required that school-aged children under 12 who returned to PEI from travelling, test negative for COVID-19 before attending school; ordered unvaccinated or partially vaccinated travellers to isolate for eight days upon entry and then test once again. The province’s PEI pass, which permitted entry onto the Island, would only be issued to people who showed they were at least two weeks removed from their second COVID-19 vaccine dose.48

---

2. In northern Ontario, travellers were required to sign in at eating establishments with verifiable personal contact information. Washrooms in most restaurants, tourist information centres, gas stations, and rest stops were closed to the public.\(^49\) The changing rules became so complicated that Restaurants Canada created a chart informing food and drink establishments of public health requirements, which coordinated with colour codes.\(^50\) For example, green was to “prevent,” yellow was to “protect,” orange was to “restrict,” red was to “control,” and grey was to “lock down.” Accommodations added further layers of restrictions. Hotel swimming pools and gyms were closed.

M. Newborns were taken from their mothers at birth under the pretence that the infant or mother may have COVID. Depending on the specific hospital, the mother could not see the child for up to 24 hours.

N. Families were denied access to loved ones in hospitals and long-term-care facilities. Scheduled surgeries were put on hold. Many patients on long waiting lists died in the interim.

O. Access to information requests were ignored by the majority of federal and provincial governments and agencies.

P. Bank officials who forced patrons to line up outside in the winter months based their orders on social-distancing and customer-limit protocols. During the day, when staff were at the bank, an added emphasis was placed on sterilizing ATM machines; but in the evening, there were no employees ensuring compliance with COVID measures.

Q. Unions are supposed to protect the rights and interests of paying members. The purpose of unions is to negotiate with employers on collective bargaining issues and workplace concerns. During COVID, however, witness testimony repeatedly pointed to the failure of unions to represent their members. Unions did not ensure vaccine-related policies were fair or transparent, and that workers’ rights and/or personal medical concerns were taken into account before employment status decisions were made. There was rarely accommodation made for employees with medical and religious exemptions. The unions did not negotiate for alternative work arrangements. Safety measures such as ventilation and sanitation, and additional safety precautions designed to protect both vaccinated and unvaccinated employees were not raised with the employer. Unions did not argue for members’ vaccination choices that emphasized personal autonomy and medical privacy. When employees who were unvaccinated were escorted from the workplace, unions did not defend the employees’ rights. Witnesses said their filed grievances were not heard. Legal and ethical issues were not considered when the COVID vaccinations were introduced. The balancing of collective and individual interests, normally advocated for by unions, was not strived for. Unions did not advocate for employer policies that protect public health and respect workers’ rights.
R. As alluded to in witness testimony, regulatory bodies\textsuperscript{51} were determined to control members who questioned COVID mandates. This was particularly true in healthcare, but other witnesses told of similar actions in their own regulatory professions as well. It was observed from the testimony that many of the actions taken by the respective regulatory bodies may have gone beyond the scope of their authority. This was not a first-time occurrence for the College of Physicians and Surgeons in Ontario. In a similar context, it should be noted that the Alberta courts in the Shelia Lewis organ transplant case went to great lengths to protect the coveted doctor–client privilege.\textsuperscript{52} The Honourable Judge R. Paul Belzil opined that in the view of the court, it is not necessary for treating officials to reconcile differences in expert opinions, but rather physicians must be free to decide which expert opinions they accept in exercising their clinical judgment which informs the standard of care.\textsuperscript{53}

\begin{itemize}
\item\textsuperscript{51} There are three types of regulatory agencies in Canada: self-governing bodies, which regulate the conduct of their own professionally qualified members; independent government agencies and boards; and regular line departments headed directly by Ministers, which regulate specified industries and activities. The governing body is empowered by provincial legislatures to determine their own requirements for admission and similarly, to discipline members who do not adhere to prescribed standards of professional conduct.
\item\textsuperscript{52} [30] It is not sufficient to establish that physicians are acting within a legislated, publicly funded framework. Were that determinative, it would follow that all decisions made by physicians would be subject to Charter scrutiny, a proposition which is contrary to existing jurisprudence, where courts have explicitly held that physicians acting in the regular course of providing medical care are not government agents: see \textit{R v. Dersch}, 1993 CanLII 32 (SCC), [1993] 3 SCR 768 at 777, 85 CCC (3d) 1; McKitty at para 48; \textit{Rasouli (Litigation Guardian of) v. Sunnybrook Health Sciences Centre}, 2011 ONSC 1500 at paras 84–93, 105 OR (3d) 761, aff’d in \textit{Cuthbertson v Rasouli}, 2013 SCC 53 on other grounds.
\item\textsuperscript{53} From paragraph (42) The Honourable Judge R. Paul Belzil (J.C.Q.B.A.) concluded in Paragraph 89, “the Charter has no application to clinical treatment decisions made by the Treating Physicians, and in particular has no application to the Treating Physicians establishing preconditions for XX transplantation. The Originating Application is dismissed in its entirety.” The case was heard on June 29–30, 2022. The decision was made on July 12, 2022. \textit{Lewis v. Alberta Health Services}, 2022 ABQB 479.
\end{itemize}
And yet many highly educated and qualified professionals, among them physicians and surgeons, who spoke publicly against government-imposed mandates—including COVID vaccines and/or governments’ responses to COVID—were subject to disciplinary actions initiated by their own professional regulatory bodies. Dissenting viewpoints were suppressed; physicians were made examples of in order to prevent other doctors from raising concerns too. Moreover, one physician testified to his willingness to lose his livelihood and professional credentials to warn the populace of the potential dangers of COVID-19 vaccinations. The fact that an increasing number of medical physicians are being systematically suspended, disciplined, or professionally removed from their positions cannot be ignored.

As the testimony revealed, the respective colleges appeared to have turned investigations into fishing expeditions. In one example, the college went so far as to seize patient files from the doctor’s office. Still, not one of these accused healthcare professionals harmed or caused the untimely death of a patient.

Ethics in the medical context includes Informed Consent. This did not happen. Governing authorities passed legislation that absolved pharmaceutical companies from wrongdoing. This meant pharmaceuticals were no longer accountable to the Canadian public for adverse medical reactions, undue harm, or death. Moreover, the clinical trials for COVID-19 vaccines are ongoing, so ethically, how could health authorities and governments condone the vaccines as safe and effective?

Both economically and socially, COVID presented significant challenges. So-called quiet quitting was an emerging trend that appeared to gain momentum as the mandates increased. It was almost as if Canadians were entering their homes and closing the door to the outside world once and for all.

Business operations were defined by bureaucrats as either essential or non-essential. Many people lost their jobs. Households faced reduced income. Family businesses that had weathered previous economic downturns were forced to close while big-box stores and government-sponsored businesses remained open. Building-size regulations or fire code occupancy authorizations were not used as a standard for determining gathering numbers. From witness testimony, Costco was allowed 818 customers in the store at the same time, while businesses and churches with similar size facilities were restricted to ten. The reduction in businesses led to decreased choices in consumer purchasing. For businesses forced to close, there was financial distress and economic hardship.

U. The goal of science is the pursuit of knowledge—not necessarily the pursuit of truth. There is a distinction. When the public follows the science, there is a shifting alliance from the supremacy of God to the supremacy of science. But science changes over time. It is not constant, which is part of the attraction to the discipline of science. Consider the Milgram experiments, the rationale of conscientious objectors,\textsuperscript{55} and the various scenarios like electroshock treatments\textsuperscript{56} that led to the establishment of professional ethical standards, such as the Tri-Council.\textsuperscript{57}

V. Religious and medical exemptions have long been accepted as forms of accommodation in Western democracies. This apparently changed during COVID, when the decision-makers for employment insurance (EI), for example, universally disallowed EI benefits to unvaccinated claimants. Given that the EI program is sustained through payroll deductions of employers and employees, the federal government does not have the legal, moral, or ethical authority to suggest the decision to reject exemptions are about balancing individual rights with the public interests. These civil employees are not qualified to determine the legitimacy of exemptions either. Why not? Because EI is not funded by the federal government. The other point worth noting here is that these same employees are not hired to challenge the legitimacy of medical or religious exemptions. Public service employees are hired to perform their duties according to the legislation that governs their responsibilities. There is no discretion in the legislation. EI as public policy is intended to provide Canadians with income when their employment circumstances change.

It should also be noted that limiting exemptions, is not a legal, moral, or ethical way for increasing vaccination rates within the broader community. It borders on coercion, which in and of itself is illegal in the public square, and this becomes more egregious when demanded as a program requirement from government employees.

\textsuperscript{56} ECT electroshock therapy also known as electroconvulsive therapy Electroshock therapy: History, effectiveness, side effects, and more (medicalnewstoday.com). (accessed June 30, 2021)

Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

W. This brings the conversation directly to the Canada Emergency Response Benefit (CERB), the Canada Recovery Benefit (CRB), the Canada Recovery Sickness Benefit (CRSB), the Canada Recovery Caregiving Benefit (CRCB), and the other forms of government compensation handouts during COVID. CERB was considered a key financial support program introduced by the federal government to provide financial assistance to individuals who were directly affected by the pandemic and lost income as a result of job loss, quarantine, caregiving responsibilities, or reduced working hours. This begs an obvious question: How can employees who contribute their hard-earned income to payroll deductions (which includes EI premiums) be denied insurance benefits for choosing not to be vaccinated, and yet, the federal government can dole out public funds with no questions asked? It is no wonder the Lord says the right hand of government does not know what the left hand is doing.\(^{58}\)

This could explain why civil liberties groups criticize the discriminatory acts of governments or why the truckers at the Freedom Convoy stood their ground in Ottawa and Windsor, Ontario, and Coutts, Alberta. Because all levels of government and health authorities, including elected and non-elected officials, arbitrarily put onerous restrictions on the movement or peaceful assembly of citizens within the public square. Indeed, the governing authorities went too far when they infringed on individual freedoms. As the testimony revealed, these same governing authorities condoned bending a knee for Black Lives Matter and other groups during COVID mandates, but then threatened the truckers and attendees at churches and funerals with hefty fines and jail time.

Besides heavy-handed bullying, the police services in Canada did not follow their own emergency plans or established protocols. There was no pursuit of justice for the greater good, either. Section 7 of the Charter—which guarantees life, liberty, and security—was discarded, as were many other constitutional provisions.

As Canadians witnessed, governments at all levels continued pursuing their objectives throughout the pandemic. Political legislation was still being put forward. The public service was still employed. Bureaucrats remained nameless. Justice was behind a screen, wherein only the privileged could obtain access. In the process, governments continued to award contracts to businesses that health authorities deemed essential. It would be difficult to deny the obvious patronage and nepotism. In the example of drug stores, witness testimony alluded to contracts awarded to administer COVID vaccinations outside of a fair and open tendering process that provided every entity, business, or organization with the same opportunities. The administrative state continued playing games with citizens’ lives—because at no point were these employees held accountable for wrongdoing.

Nevertheless, when someone points the finger at citizens, there are three fingers pointing back at them. Governments, like the people, are bound by the law. Governments cannot just decide which laws are to be obeyed and which are to be disregarded.

---

\(^{58}\) Jonah 4:11.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Throughout COVID, there were winners and losers—each declared by the same governing officials who were elected to represent the public’s best interests but did not. There was excessive power imposed by authority figures against hardworking Canadians: police versus citizen, teacher versus student, employer versus employee, judge versus accused, elected official versus constituent, vaccinated versus unvaccinated. Is this the trickle-down effect of passive-aggression? Or is it simply the governments’ method for crumbling a democracy from the inside out?

Regardless, the same application of the law for citizens did not apply equally to those in privileged positions of power. And there was no accountability or transparency. As numerous witnesses shared, ordinary citizens were arrested and detained in jail cells for standing firmly on the rights and freedoms established in the Constitution Act of 1867, the Charter, and the Bill of Rights. Churches were seized. The RCMP sent canine units to hunt for peaceful churchgoers. Truckers participating in the Freedom Convoy had assets seized. And so did a retired Ontario Provincial Police officer for facilitating dialogue between the truckers and governing administrators.

Did anyone ask: Where was the presumption of innocence? Or what happened in Canada that negated the administration of justice? Who is responsible for adhering to the Precautionary Principle in public policy making, which should have legitimized the adoption of preventive measures to address potential risks to the public? Who is the ultimate judge when egregious actions should lead to liability, but there is no public recourse? Who lied?

Perhaps the country can take a lesson from witness Steve Kirsch, who said, “The state has manipulated your mind; once you are willing to question your beliefs, everything else makes sense.”

---

59 Passive-aggression behaviour is when you express negative feelings indirectly instead of openly talking about them, for example, During World War II, when soldiers wouldn’t follow officers’ orders, experts described them as “passive-aggressive.” A new term back then, but one that is still relevant today. Someone who uses passive-aggression may feel angry, resentful, or frustrated, but they act neutral, pleasant, or even cheerful. They then find indirect ways to show how they really feel. Passive-aggression isn’t a mental illness. But people with mental health conditions may act that way. Passive-aggression could damage your personal and professional relationships.

This is not to suggest there are not some glimmers of hope. The *Ingram* legal case in Alberta is most certainly a step forward for democracy and justice. Citizens are awakening to the repeated propaganda and messaging that consumed the airwaves over the three COVID years. Critical questions are being asked. And over 300 brave souls, Canadian citizens who believe in standing up for what is right and just and true, shared their personal testimony so that this nation, from shining sea to sea to sea, could be restored from the clutches of schoolyard bullies in adult bodies who need to understand, first, the meaning of *good governance* before sitting in positions of privilege.

American writer, novelist, and Pulitzer Prize winner Pearl Buck\(^61\) (1892–1973) described the true essence of society in this way: “Our society must make it right and possible for old people not to fear the young or to be deserted by them, for the test of a civilization is the way that it cares for its helpless members.” United States Vice-President Hubert Humphrey\(^62\) carried Ms. Buck’s thought one step further when he said, “The moral test of government is how government treats those who are in the dawn of life, the children; those who are in the twilight of life, the elderly; those who are in the shadows of life: the sick, the needy, and the disabled.”

Or, as Jesus so aptly said in the synagogue in Nazareth, “The Spirit of the Lord is upon Me, because He hath anointed Me to proclaim good news to the poor. He has sent Me to proclaim liberty to the captives and recovering of sight to the blind, to set at liberty those who are oppressed, to proclaim the year of the Lord’s favour.”\(^63\)

This is the ultimate mission field for all Canadians to pursue, and in so doing, let the brave NCI witnesses and the truckers in the Freedom Convoy join the many other Canadian voices that understand real answers are not found in rationalizing logic (because as we have observed over the COVID Years, logic too often turns into evil), but rather in shining brightly in one accord, so we too, as proud Canadians, can adamantly declare, “Never again.”

**Recommendations**

The discussion raises important concerns about the negative impacts of the federal government’s pandemic response on the fabric of Canadian society. These impacts encompass a wide range of areas, from personal freedoms and trust in institutions to economic, social, and health consequences. To prevent such issues from happening in the future, we put forth the following 12 recommendations.

**A. National Crisis Oversight Council**

Commission a study to determine the validity of setting up a National Crisis Oversight Council (NCOC), with a rationale and expected format as follows:

---

Rationale

Establishing the NCOC is essential to safeguarding democratic principles, protecting individual rights, and maintaining public trust during future emergencies, such as pandemics. The NCOC will serve as an independent, multidisciplinary body tasked with monitoring, policing, and investigating government actions during crises.

Basic Characteristics and Principles

Representation: The NCOC will comprise representatives from diverse sectors of society, including law, medicine, science, faith, business, media, arts, and culture. Each member will undergo a public appointment process, with credentials and potential conflicts of interest transparently disclosed.

Subpoena powers: The council will possess subpoena powers, allowing it to compel testimony and evidence from all sectors, including government officials, the judiciary, and other relevant stakeholders.

Public access: To ensure transparency and accountability, the NCOC will offer the public direct and unfiltered access. A user-friendly platform will enable citizens to express concerns, provide observations, and access council proceedings.

Legislative clarity: The powers and responsibilities of the NCOC will be clearly outlined in legislation, eliminating the need for regulatory details to be determined separately. This legal foundation will establish the council’s authority and scope.

Empowerment for change: The NCOC will have mechanisms to influence government actions during emergencies. It will be empowered to make recommendations, demand corrective actions, and trigger public awareness campaigns when necessary. Its primary goal will be to uphold democratic values and individual rights and freedoms, and help ensure the wellbeing of citizens.

Media access: The council will be expected to have unrestricted access to all forms of media to maintain public trust and transparency. Regular briefings, reports, and public statements will keep citizens informed of its activities and findings.

Purpose and Benefits

The NCOC would be founded on the principle that a robust system of checks and balances is vital in times of crisis. Its purpose would be to:

- Safeguard democracy: Ensure that democratic principles are upheld during emergencies, preventing overreach and abuse of power.
In summary, the establishment of the NCOC would be a proactive response to ensure that during future emergencies, the rights and values of Canadian society are upheld. It strengthens democracy, promotes transparency, and empowers the public to actively participate in safeguarding their wellbeing and fundamental rights.

B. **Transparency and honest communication**: Governments should prioritize transparent and honest communication with the public during crises. Information about the nature of the crisis, measures being taken, and the expected duration of those measures should be clearly and consistently conveyed.

C. **Accountability mechanisms**: Establish mechanisms for holding public officials accountable for their decisions during crises. This includes oversight bodies that can review actions taken by governments and ensure they align with constitutional rights and freedoms.

D. **Respect for constitutional rights**: Safeguard constitutional rights and freedoms, even during emergencies. Governments should not infringe on these rights without clear and justifiable reasons, and any restrictions should be proportional and time-limited.

E. **Balanced approach**: Develop and implement a balanced approach to crisis management that considers public health alongside economic, social, and mental wellbeing. Decisions should be evidence-based and consider the broad spectrum of societal impacts.

F. **Community engagement**: Engage with communities, civil society organizations, and a wide range of experts in decision-making processes. Encourage open dialogue and ensure that policies and measures are sensitive to the unique needs and circumstances of different groups within society.

G. **Education and awareness**: Promote public education and awareness about public health measures, their rationale, and the expected outcomes. Informed citizens are more likely to be able to make informed decisions and hold officials accountable for their actions.
H. **Support for vulnerable populations**: Develop strategies to support vulnerable populations during crises—such as the homeless, those struggling with addiction, and victims of domestic abuse. Ensure that access to essential services is maintained.

I. **Healthcare infrastructure**: Invest in and strengthen healthcare infrastructure to ensure capacity and readiness for future public health emergencies. This includes resources for mental health services, addiction treatment, and domestic violence support.

J. **Mandatory ethics training for health care workers**: To enhance the ethical standards and ensure the protection of fundamental patient rights and access to care, we strongly recommend the implementation of annual mandatory ethics training for all healthcare workers. This training should apply to frontline, administrative, and managerial staff across the healthcare system, resulting in the following benefits:

   - **Ethical awareness**: Annual ethics training will promote awareness of ethical principles, ensuring that all healthcare workers have a comprehensive understanding of their ethical responsibilities toward patients, colleagues, family members, and the healthcare system as a whole.
   
   - **Patient-centred care**: Ethical training will underscore the importance of prioritizing patients’ wellbeing, rights, and dignity in all healthcare decisions and actions. It will reinforce the commitment to patient-centred care.
   
   - **Legal and regulatory compliance**: Ethical training will help healthcare workers understand and comply with legal and regulatory requirements related to patient rights and access to care, reducing the likelihood of breaches and legal issues.
   
   - **Improved communication**: Ethical training can enhance communication skills, fostering open and honest dialogue with patients and their families. This will contribute to better-informed decision-making and greater patient satisfaction.
   
   - **Crisis preparedness**: In times of crises like the COVID-19 pandemic, healthcare workers will be better prepared to make difficult ethical decisions under pressure, ensuring that patient rights and access to care are upheld even in challenging circumstances.
   
   - **Accountability**: Mandatory training establishes clear expectations and accountability for ethical behaviour. It provides a basis for addressing breaches and taking corrective actions promptly.
   
   - **Continual improvement**: Annual training allows healthcare workers to stay updated on evolving ethical guidelines and best practices, facilitating a culture of continual improvement in patient care.
   
   - **Organizational culture**: Ethical training can contribute to building a culture of respect, compassion, and integrity within healthcare institutions, benefiting both patients and staff.
K. **Scientific integrity**: Protect the integrity of scientific research and expert opinions. Encourage open debate and diverse perspectives within the scientific community to ensure that policy decisions are well informed.

L. **Legislative safeguards**: Review and update emergency powers legislation to strike a balance between swift response and protection of individual rights. Ensure that such powers are subject to regular parliamentary review and oversight.

In essence, the goal is to develop a comprehensive strategy that prioritizes the health and wellbeing of citizens while respecting democratic values, individual rights, and the resilience of Canadian society as a whole. These recommendations aim to foster a society where crises are managed with care, accountability, and a commitment to the long-term welfare of all citizens.
7.2.8. The Effects of Government Pandemic Measures on Faith Communities

Introduction
When governments decided to close gathering places during COVID, it wasn’t by chance or because the safety of citizens was at risk. It was according to the playbook of totalitarian regimes that authoritarian governments resort to when attempting to control the citizenry. By design, the first to close were gathering places where people could freely converse. From a bigger-picture perspective, it appeared to be all part of the plan to prevent people from discussing the motivations behind the launching of a strange flu-like pandemic—and possibly, too, in meeting, from finding ways to resist the oppressive actions of governments that followed the playbook.

Curiously, the first ordered closed were restaurants, in-person bereavement, addictions support, small businesses, schools, meeting places, and places of worship—each deemed non-essential by health authorities. Although this section primarily deals with churches and how governments used force to shut down congregant assemblies that had remained open or that decided to reopen during the pandemic, it is also a message of hope and education: that going forward, every citizen initiative, every support group, every business regardless of size or purpose, every school, and every church will always be deemed essential. Readers will also have an opportunity to understand why governments and their agencies acted beyond the scope of the law.

More important, this section on faith and churches provides a glimpse into the lives of the real heroes in Canada—the many NCI witnesses who boldly and very publicly proclaimed their very personal life experiences. These strong men’s and women’s actions represented a higher calling, including standing up for democratic ideals, the Constitution, an ordered society, and functioning social fabric—where men and women are free to serve others without barriers from the state. It is these individuals (and the many more voices NCI could not accommodate) that will be recorded in the history books. For it was these honest hardworking Canadians who stood boldly against persecutors and prosecutors alike.

Perhaps the next time the federal and provincial governments, the media, the judiciary, professional regulatory bodies, police forces, the public service, school boards, ministers of health, and solicitor generals act beyond their respective scope of authority, and not under the supremacy of God and rule of law, the people of Canada will stand together in unity against any and all authorities that choose not to respect the people of Canada, from which ultimately comes their power.

Why is this important? Because this democratic experiment called Canada—founded firmly under the supremacy of God and rule of law—is still worth fighting for. To this end, public policy makers need to become educated with Canada’s constitutional roots—and those governing, reacquainted with representing the populace, rather than appointing non-elected bureaucrats to dictate by rule. Therefore, if the intent is to represent well, governing authorities ought to respect that every citizen, including the privileged, are not only equal and free, but on a lifelong spiritual journey.
While people’s beliefs in God or a higher power may differ, what is universally true for all citizens who are not philosophical materialists is that Canadians are united in our understanding of life as being a spiritual journey. That citizens are living souls, unique beings created for a purpose, and for this reason alone, citizens require the freedom to embark upon their respective faith mission, in accordance with their personal conscience and convictions.

These same ideals and moral values inspired Canada’s first Constitution. Not just religious-based traditions, as today’s secular-minded might imagine, but moral values that reflected the conscience and faith of people throughout the country. It is in this spirit the framers and founders laid down a God-inspired foundation that resulted in Canada becoming a beacon of hope. The founders were determined to prevent legislative or administrative decision-makers from fettering the exercise of discretionary powers in the future. Carefully crafted checks and balances were critical in establishing the institutional pillars and framework that would prevent citizens from potentially enduring abusive authoritative governments. Legal precepts were based on the moral laws of God. Freedom and, most particularly, keeping religious freedoms safe from tyranny and dictators, was paramount. This led to Canada’s founding on the supremacy of God and rule of law.

“Insofar as the dialectic between God as supreme and law as human rule is observed, maintained, nurtured, developed, and practised, Canadians will be blessed with rights and freedoms truly worthy of men and women.”

In other words, neither the supremacy of God or the rule of law could be true unless both were equally true. A more comprehensive explanation of the significance of this point follows. But for now, any theological or political analysis intended to shape this nation should begin with God and church.

So, what is a church? Metaphorically, a church can be likened to a lighthouse. It orients ships away from coastal dangers. It also directs ships safely into harbour. In carrying out these dual responsibilities, the lighthouse illuminates a light so powerful it resonates with neighbours near and far. Nonetheless, a lighthouse is much more than an historic landmark. Ships sailing in the height of a raging storm would be lost without it. For the lighthouse keeper, never letting the light go out is much more than a job. Indeed, it can be legitimately equated with a life calling.

It is from this perspective that the figurative aspects of the lighthouse can be compared to religious and faith-based organizations. Like lighthouses, churches, too, are analogously situated as beacons of light in communities, instrumental in warning people of life’s imminent dangers—both spiritual and physical. This may explain why churches strive to provide stability for congregations. Similarly, churches carry the torch of inviting people into abundant life, wherein, like the lighthouse, the light of life shines brightly.

65 John 4:14; John 5:24; John 8:12.
Further, people recognize the need for an anchor that holds during times of societal upheaval. Historically, churches have stepped into this role. Recognized as places of belonging and solace, church communities are charged with spreading the good news gospel message of the Lord Jesus Christ. Often this includes displaying faith and the love of others through charitable works. These include loving one’s neighbours, taking care of the elderly and orphans, and giving so that no one within society is without.\textsuperscript{66}

But today, like many societal constructs, there are exceptions. Not every church provides spiritual direction and moral guidance. Not every religious organization believed it was wrong to acquiesce to a government-imposed moratorium on civil liberties and freedoms. For the churches consequently caught in the quagmire of COVID restrictions, several immediate concerns emerged. Specifically, the spiritual leaders and attendees of these congregations believed blind obedience to worldly governments contravened the Lord’s command to assemble.\textsuperscript{67} The authorities in Canada ignored this nation’s founding principles.

Many of the congregants within churches that remained open or reopened during the pandemic cited the scriptural example of apostles Peter and John, who authorities commanded not to preach in that name. The apostles responding said, “Whether it be right in the sight of God to hearken unto you more than unto God, judge ye. For we cannot but speak the things which we have seen and heard.”\textsuperscript{68} Thereafter, the apostles continued preaching in the name of Jesus.

Other churches pointed to Romans 13. Here, apostle Paul offers a reasoned rationale for submitting to higher authorities. To paraphrase, rulers, by virtue of their office are responsible for promoting the good within society, while similarly protecting the public’s interest. When churchgoers submit to governing authorities, it is because these same authorities understand the important contributions religion and churches make within communities and, by extension, the social fabric. Reverend Jonathan Mayhew offered an in-depth commentary of Romans 13 in the year 1750. He states:

Some suppose the apostle in this passage enforces the duty of submission, with two arguments quite distinct from each other; one taken from this consideration, that rulers are the ordinance, and the ministers of God (Romans 13:1–2, 4) and the other, from the benefits that accrue to society, from civil government (Romans 13:3–4, 6). And indeed, there may be distinct motives and arguments for submission, as they may be separately viewed and contemplated.

\textsuperscript{67} Hebrews 10:25.

\textsuperscript{68} Acts 4:19.
But when we consider that rulers are not the ordinance and the ministers of God, but only so far forth as they perform God’s will, by acting up to their office and character, and so by being benefactors to society, this makes these arguments coincide, and run up into one at last. At least so far, that the former of them cannot hold good for submission, where the latter fails.  

As alluded, the persons who are vested with authority are those who are democratically authorized to carry out their legislative duties and responsibilities on behalf of the citizenry. Who those are, the apostle notably leaves Christians to determine for themselves; but whoever they are should be obeyed. Why? Because it is not without God’s permission that these are clothed with authority to cultivate good within society. This is not to suggest that rulers have their commission immediately from God, the supreme Lord of the universe, because according to Reverend Mayhew, this would border on blasphemy.  

Only mind to do your duty as members of society; and this will gain you the applause and favour of all good rulers. For while you do thus, they are, by their office, as ministers of God, obliged to encourage and protect you; it is for this very purpose that they are clothed with power.  

But what happens when these same state authorities choose to do evil, subsequently becoming a terror to good works? Historically, the Romans 13 interpretation wherein believers are taught to submit to oppressive leaders without question (also recognized historically as the divine right of kings’ doctrine) is not a new impasse. For centuries, this long-misunderstood analysis has surfaced in the public square, primarily whenever a plan is underway for some governing authority to overstep its constitutional and legal authority.  

Some surmise the intent of these constant resurgences of Romans 13 is to confuse and divide the church. Nevertheless, to suggest Paul’s counsel to believers, translates into blindly submitting to lawless rulers acting in contradiction to their own laws, is reprehensible to many who believe there is only one King. That is, Jesus Christ, the one and only blessed Potentate, as King of kings and Lord of lords.  

---

69 Mayhew, Jonathan. A Discourse Concerning Unlimited Submission and Non-resistance to the Higher Powers, 1750  
70 Ibid.  
71 I Timothy 6:15; Revelation 19:11-16; Revelation 17:14; Deuteronomy 10:17; Psalm 136:3.
For rulers are not a terror to good works, but to the evil. It cannot be supposed that the
apostle designs here, or in any way of the succeeding verses, to give the true character of
Nero, or any other civil powers then in being, as if they were in fact persons as he describes,
a terror to evil works only, and not to the good. For such a character did not belong to them;
and the apostle was no sycophant, or parasite of power, whatever some of his pretended
successors have been. He only tells what rulers would be, provided they acted up to their
character and office.72

Therefore, it should be obvious that when apostle Paul spoke concerning the office of civic
rulers, his purpose was to encourage that which was good. It was not to dictate beliefs and
practices in religious circles, or to make laws for governing men’s consciences; or even to
inflict civil penalties for religious crimes. Apostle Paul (formerly Saul) understood the value of
an ordered society wherein God’s authority is fully recognized. As a Pharisee of Pharisees,
Paul was very well educated. But Paul also understood the Lord’s grace: “For by grace are ye
saved through faith, and that not of yourself. It is the gift of God.73

Still, as the inversion of Romans 13 suggests, most scribes and pharisees were non-believers,
recognized as heathen when it comes to faith, and therefore, relentless enemies of the Lord Jesus
and the beliefs of faith-based Christianity. After Paul’s conversion, the apostle himself suffered
reproach. He was repeatedly imprisoned, beaten with rods, stoned, shipwrecked, in perils of waters,
in perils of robbers, in perils of the heathen, and even in perils of his own countrymen. Wherever
Paul travelled, he was at significant risk—in the city, in the wilderness, and in the sea.74 While Paul
repeatedly suffered at the hands of tyrannical-type rulers, he was not about to give these same
rulers the authority to exterminate the Christian faith. Didn’t Paul repeatedly preach against the
idolatries and superstitions of paganism which resulted in the promotion of evil?75 Reverend
Mayhew asks the same question.

72 Mayhew, Jonathan. A Discourse Concerning Unlimited Submission and Non-resistance to the
Higher Powers, 1750.

73 Ephesians 2:8–9.

74 Mayhew, Jonathan A Discourse Concerning Unlimited Submission and Non-Resistance to the
Higher Powers; With Some Reflection on the Resistance Made to King Charles 1. And on the
Anniversary of his Death: In Which the Mysterious Doctrine of that Prince’s Saintship and Martyrdom
is Unriddled. 1750.

75 II Corinthians 11:21–27.
Can anyone reasonably suppose that the apostle had any intention to extend the authority of rulers, beyond concerns merely civil and political, to the overthrowing of that religion which he himself was so zealous in propagating. But it is natural for those whose religion cannot be supported upon the footing of reason and argument, to have recourse to power and force, which will serve a bad cause as well as a good one; and indeed, much better.

There are additional reasons why certain churches challenged health orders. First, the scriptures dating back to the beginning of civilization are full of examples of good governance. Canada’s parliamentary practices and laws are firmly grounded in biblical text. The election of leaders through a democratic process also emanates from the Bible. Some prime examples include the selection of seven table servants to look after the widows and orphans; the replacement of the disciple who betrayed Jesus in the Garden of Gethsemane; the Israelites desiring an earthly king to rule over them; and when God instructed Adam and Eve to be good stewards over the land.

The Old Testament offers a further example whereby the Lord God raises seven of twelve judges for the explicit purpose of saving His people out of the hands of raiders. One of these judges was a woman named Deborah. Therefore, the right of resistance, and by extension, the right of believers to resist the usurpation of power by tyrannical authorities has its origin in scriptures as well.

The point being the right of people to depose a ruler whom they find oppressive was established very early in the scriptures. There were also acts of peaceful civil disobedience. In Moses’ time, for example, the midwives were ordered to kill all Hebrew male newborns. When called to give an account before Pharoah, these midwives pointed to the Hebrew women giving birth before the midwives could arrive. There is more:

---

78 I Samuel 8:4–22.

79 Genesis 1:28; I Peter 4:10.

81 Exodus 1:15–21.
If those who bear the title of civil rulers, do not perform the duty of civil rulers, but act directly counter to the sole end and design of their office; if they injure and oppress their subjects, instead of defending their rights and doing them good; they have not the least pretence to be honoured, obeyed, and rewarded, according to the apostle’s argument. For his reasoning, in order to show the duty of subjection to the hither powers, as was before observed, built wholly upon the supposition that they do, in fact, perform the duty of rulers ... exalted to bear rule; and as magistracy duly exercised, and authority rightly applied, in the enacting and executing good laws.\textsuperscript{82}

In this context, laws have two purposes. The first is to ensure the common welfare and best interests of the people comes to fruition. Second, the laws must be agreeable to the will of the beneficent author and supreme Lord of the universe; whose King of kings\textsuperscript{83} rules over all: and whose tender mercies are all over His works.

To suggest tyrants are God’s ministers would be particularly corrupting when these same rulers oppress the citizens they are called to represent. The Scriptures again point to the example of the Israelites in Egypt. The Israelites had asked for time off from their brick-making responsibilities to worship their God. Pharaoh decided that if all the Israelites could think of is worshipping God, then perhaps, they needed to fetch the straw, too, for making bricks. Up until this point, the Egyptians would bring the straw.\textsuperscript{84} In today’s world, it could be likened to the constant increases in taxes. Whatever way the example is discerned, it is important to observe these authorities had stopped submitting to the ordinance of God. This meant, in turn, failing to rule for the good of all people.

Over time, philosophers and scholars shifted their focus. Rather than question whether Christians have a right to oppose unjust laws, the reasoning moved to the justice or injustice of the laws on their own merit. Ironically, the conclusion, “A law which is not just does not seem to me to be a law.\textsuperscript{85} This same premise is confirmed again in section 52(1) of the \textit{Canadian Charter of Rights and Freedoms}, which states, “The Constitution of Canada is the supreme law of Canada, and any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect.”\textsuperscript{86}
As stated previously, the preamble to the Constitution formally recognizes Canada is founded upon principles that recognize both the supremacy of God and rule of law. This means every right and freedom guaranteed within the Charter are formally declared to be founded upon these two principles. Together, these prefatory words are the grounding point which inevitably holds this nation together. It is equally important to note the founding fathers relied on the same tenets in establishing Canada’s original Constitution, the British North America Act (BNA).

In the interest of clarity, it is important to understand that the supremacy of God and rule of law must concurrently hold true. If neither aligns perfectly—or there is a movement of either the supremacy of God or rule of law taking precedence over the other—the result is a broken democracy. Why? Because the rule of law is no longer subject to the supremacy of God (spiritual) and vice-versa: the supremacy of God is no longer beholden to lawful interpretation (political/judicial).

Without both being subject to the other, the elevation of the rule of law leads to tyrannical authoritarian governments which then insist any new law created, even those laws which are absolutely immoral, must be obeyed. Conversely, without the supremacy of God, there lacks an understanding of a much higher law, a spiritual law, that emanates from knowing there is a hereafter.

When Benedictus Spinoza wrote Theologico-Political Tractatus, he argued the Bible, as the sovereign cause of itself, must be interpreted separately on its own terms. Therefore, the Bible cannot be subordinated to a conception of reason, which in this case, would be viewed as a political authority, which is neither superior or inferior to it, either its master or its slave.

For religion, and Christian assemblies in particular, the moral laws of God are not written on tablets of stone or established through legal precedent but penned in individual hearts. Thus, the separation of governance and religious powers is, by virtue of their respective roles, completely independent from one another. This distinct separation is fully understood, since both pillars must, by design, remain fully accountable to both God as supreme and the rule of law. Further, as the framers of Canada’s founding Constitution, the British North America Act, reveal, church responsibilities to the state are not described. Only the state’s obligatory duties to the public are specifically defined. Interestingly—but not surprising, given the original founder debates—the BNA remained silent on the status, authority, and responsibilities of religious institutions within the union. At its root, the duty of the state is neutrality.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

For clarity, the law of neutrality refers to the legal principles and regulations that govern the behaviour of states during times of conflict. Neutral is the state of not taking sides but, instead, maintaining an impartial stance, and that essentially means not favouring one party or perspective over another. In Canadian constitutional jurisprudence, this means the state has an obligation and responsibility to ensure its laws or policies do not unduly burden the practice of religious freedoms. Taken one step further, the state is prevented from enacting laws that result in favouring, or conversely, heavy-handedly burdening one religious belief system over another.

While the rights and freedom provisions in both the historical documents and the Charter apply equally to both religious and non-religious, secular and non-secular persons alike, it quickly became evident during the COVID pandemic that the safeguards, protections and fundamental principles afforded to every citizen equally were increasingly denied to the only congregants the state viewed as a threat to its current and evolving state ideologies.

Perhaps, here, it should be stated that while representatives of every religion and faith group were invited to testify at NCI, it was primarily those of the Christian faith who chose to do so. This was not a premeditated design or some one-sided agenda to stack the deck. It is just what happened. Further to this point, it should be acknowledged that newcomers and immigrants to Canada might have been afraid to publicly speak because in the countries from whence they came, airing one’s views publicly could inevitably result in danger or death.

Regardless of religious (or non-religious) affiliations, all Canadians should recognize that any limitation imposed by the state on even one single Charter freedom can be no greater than necessary or, by extension, must be demonstrably justified by those that govern. As background, the Canadian Charter of Rights and Freedoms, enacted in 1982, forced all governments to revise laws that were contrary to the Charter by 1985. The citizenry presumed, going forward, that any law enacted after 1985 would remain consistent with Charter provisions, and therefore, for the most part, was not concerned that their constitutionally protected rights and freedoms would ever be jeopardized.

The Charter guarantees citizens more than one freedom. Every citizen, for example, has the right to hold and practice their deeply held beliefs without interference or disruption by state authorities. Other protections include freedom of thought, opinion, belief, conscience, and expression. Accommodation and equality rights correspondingly prohibit discrimination.

---

87 Scott, F.R. A Policy of Neutrality for Canada, January 1939.
However, the terms of citizens’ rights and freedoms were arbitrarily changed with the introduction of emergencies legislation in Canada. Formerly known as the War Measures Act, the Emergencies Act granted the federal government expanded powers that go beyond the scope of acceptable laws and regulations within Western democracy. While the Emergencies Act covers a wide range of emergencies—including war, invasion, and insurrection—this Act was written to suggest emergency powers can be invoked when government(s) believe the situation cannot be adequately managed through existing laws and resources.

The procedure for declaring an emergency in Canada is this: the Act requires the Governor-in-Council (cabinet) to declare that a state of emergency exists. This declaration must outline the nature of the emergency and specify to the public the powers that governments plan to exercise. Depending upon the severity of the emergency, the authorization presented to the public by governments may restrict the ability of citizens to carry on their day-to-day activities. To prevent abuse, the emergency declaration must be reviewed on a strict cyclical timeline. Likewise, any restrictions on the populace are subject to judicial oversight and must be consistent with Canada’s constitutional rights and freedoms.

As we heard from NCI witness testimony, the concerns cited by all levels of government in the beginning of the COVID pandemic may have warranted some societal restrictions, but it didn’t take long before the truth began to surface. Was COVID a national emergency such as war, insurrection, or an invasion? Did COVID threaten the populace? Or was it a hoax? As one witness asked, “What is the point of strict distancing in the airport, only to crowd everyone into a plane like sardines in a can?” Another witness asked why COVID restrictions for air travel were lifted in the United States months ahead of Canadians. Yet another witness simply asked, “Is this Canada?” Certainly, the contradictory rules raised numerous questions.

Around this time, pockets of citizen resistance across Canada began to emerge. A number of churches decided to open their doors and stand in the gap for all Canadians. Like the founders of this nation, the churches wanted to ensure the inherent, God-given rights and freedoms of all citizens remained intact. This included the right of all Canadians to attend religious services, to worship God, and to be fully accommodated when state policy priorities transcend personal convictions and conscience. The overarching rationale? That within the spirit of the law, any attempt by the state to impose another authority over the church (including governments) translates into undermining the authority of Jesus Christ as the head of the body of Christ Church, which cannot be tolerated.88

88 Ephesians 1:22–23; Psalm 118:22; Ephesians 4:8, 12; Ephesians 5:23; I Corinthians 11:3; Colossians 1:18; Psalm 68:18; Colossians 2:10.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

As alluded to previously, this inalienable right to worship the Lord not only predates the founding of Canada but has, from the beginning, been instrumental in nations receiving the Lord’s blessings. As the framers of this nation ultimately decided—when they intentionally chose a unique, one-of-a-kind correlation for church and state within the Canadian political landscape—only He determines the standing of His Church.\textsuperscript{89}

Not to be outdone, federal and provincial authorities have more recently relied on a self-serving interpretation of section 1 of the Charter, which ironically, gives deference on all judicial matters to the ruling government. It is at this juncture that the witness testimony becomes even more meaningful in shaping the relevance and necessity of the modern-day church to stand in opposition to a lawless state.

Equally significant are the innumerable negative consequences that emerged within the social fabric when churches became noticeably absent from the societal constructs. Like the ships seeking guidance from a lighthouse keeper amid a rampant, late-night storm, multitudes of people needed an anchor to secure themselves and family members in the societal turbulence caused by COVID measures. Sadly, the spiritual guidance and support the populace sought could rarely be found. Were government authorities successful in their quest to extinguish the light displayed via faithful assemblies? Or was the Constitution simply rules that have been papered over? It is from these perspectives and many more that long-lasting and satisfactory remedies must be found.

\textbf{Canada’s Historic Beginning}

Canadians understand intuitively that a Constitution is a corpus of fundamental law that must, by definition, be subject to the control of those whose lives it regulates. And, similarly, that constituents in Canada are not subservient to the arbitrary whims of dictators, whose motivations include oppressing the populace. Even before Canada was founded as a nation, churches responsible for spiritual matters operated separately from legislated government institutions. Or, as the Scottish used to sing, "Never the twain shall meet."\textsuperscript{90}

This ideal was a priority for the initial framers of this nation. These practical men, (who were often claimed to be pragmatists), understood democratic principles well and, as such, envisioned a future remarkably unique from what they had known from the past. This was evident from the lengthy debates and deliberations which followed: on self-government, representative institutions, security of property, the rule of law, the framework of democratic ideals in a new land that to them must include freedom of conscience, individual rights, and responsible governments that guarantee at its very core political liberty and equality.

\textsuperscript{89} John 18:28; Acts 5:29; I Peter 2:13-17; II Chronicles 7:14.

\textsuperscript{90} Lang, Andrew. “The Bonnie Banks of Loch Lomond.” 1746–1876.
Undoubtedly, the founding fathers firmly believed themselves to be free men. This is evident from the dialogues regarding conscience and liberty within the constitutional framework of a responsible parliamentary government. Although the status of the church within governments and society had yet to be established, its institutional importance was integral to the discussions that took place.

As Reverend Mayhew preached, “Let us all learn to be free, and to be loyal. Let us not profess ourselves vassals to the lawless pleasure of any man on earth … [instead] be loyal to the Supreme Ruler of the universe, by whom kings reign, and princes decree justice. To which King eternally immortal, invisible, even to the only wise God, be all honour and praise, dominion, and thanksgiving through Jesus Christ our Lord. Amen.”

He further claimed that any citizen advocating for unlimited submission or passive obedience to a king or monarchial government wherein those in authority have a divine right to do whatever they please whenever they want, to the point where no one can resist, is misled. But the reverend does not stop at the divine right of kings doctrine, as being only applicable to the king. He also includes all subordinate officers acting beyond their commission and the authority. Today, the equivalent of subordinates would be the public service.

Equally key to the prevailing mindset at the time (and very different to our post postmodernism era) was the understanding that hardly anyone would have argued against imposing consensual standards within a community, even when they extended to the private conduct of consenting adults.

---

92 Divine right of kings is a political doctrine in defence of monarchical absolutism, which asserted that kings derive their authority from God and could not therefore be held accountable for their actions by any earthly authority such as parliament or the legislature. The bishop Jacques-Benigne Bossuet (1627–1704) was one of the principal French theorists of divine right, asserting that his power was modelled on that of a father’s and was absolute, deriving from God; and that he was governed by reason. Anti-absolutist philosopher John Locke (1632–1704) wrote his *First Treatise of Civil Government* (1689) in order to refute such arguments.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

While the obvious imminent concern was the very real possibility and threat of dictatorial rulers and writing a Constitution that would prevent tyrannical government from coming to power, the founding debates represented a much broader intersection—which included the preservation and practice of liberty and religion. For example, T.L. Wood described liberty as inalienable rights. An inalienable right is usually characterized as one that may never be waived or transferred by its possessor. For example, the right to life, liberty, and security. These differ from forfeitable or absolute rights.

“The natural liberty of man is to be free from any superior power on earth and not to be under the will or legislative authority of men but to have only the law of nature for his rule.”

Interestingly, William D. Lawrence was opposed to Confederation, calling the proponents of a unified country traitors and enemies. Further to the point, he said in 1884, “All great results have been the result of years of thought and care . . . there is nothing like a stiff opposition for a man to succeed . . . Kites rise against, not with the wind.” Nevertheless, he proclaimed the spirit of liberty as forever being heard wherever it exists, and that limiting a person’s freedom would never satisfy a free people.

Charles Tupper, for the most part, agreed with both colleagues, firmly believing both civil and religious liberty is needed to be enjoyed by all. He added that he himself would be happy knowing there existed no hostility between different religions. And Frederick Brecken ventured even further, pointing to self-government as the greatest blessing of all because he could now worship God as he pleased. But after some reflection, he also later queried if becoming part of the dominion would at some point in the future, jeopardize this inherent religious freedom.

93 March 10, 1870.

94 Liberty is the exemption from extraneous control; freedom: the power or liberty to order one's own actions; the power of the will in its moral freedom to follow the dictates of its unrestricted choice and to direct the external acts of the individual without restrain, coercion, or control from other persons.

96 Moore, Marven. The Nova Scotian, January 12, 1884.

98 March 28, 1864.

99 March 8, 1870.
A similar sentiment was reiterated by John McMillan when confronted with anti-Christian and unphilosophical excess. Here he pointed directly to Scripture, asking his opposers, who said this line: “And hath made of one blood all nations of men for to dwell on the face of the earth, and hath determined the times before appointed, and the bounds of their habitation, that they should seek the Lord, if haply [sic] they might feel after Him, and find Him, though He be not far from every one of us.”

For those who may not understand the question to Mr. McMillan, this scripture refers to the God of the Bible who desires that we seek after Him.

Others, like W.H. Pope, would be happy to see the province he represented, Prince Edward Island, unite with neighbouring provinces if it would result in the Protestant population having less cause to dread popish supremacy, that religious animosities would weaken, and ultimately great good would become the consequence.

Still another, Robert Pinsent, advocated enjoying the privileges of Britain’s unwritten constitution [the British constitutional conventions] in its full perfection, without blot or blemish. But Pinsent also wanted an education system that offended none, the fullest measure of civil liberty, and perfect freedom and equality in religion, where the exercise of constitutional government can be better and more effectively applied.

What does all this mean? Taking together, the original framers wanted the Constitution to be legitimate in the public’s eyes. The priorities were twofold. The first was how to prevent tyrannical persons from gaining governing authority; and the second, the intertwined connection between churches and state, and civil liberties. This should not be surprising. After all, these men (based upon their own personal convictions), wanted the particular religious institutions they cherished to continue. However, they also understood the underlying necessity that within broader society, this also included respecting the religious traditions of others as well.

Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

To this end, religious liberty was repeatedly discussed in the context of responsible government. Notably, at length. Many sided with John Locke’s arguments¹⁰⁴ that all legitimate government rests upon the consent of the governed, and therefore, the government is beholden to the people. Locke is famous for suggesting church and state should be separate. Perhaps, to a greater extent, that religion and religious distinctions should be banned altogether from operating side-by-side with governments within the political sphere. In essence, this meant politics and the leaders within political systems should be concerned with the people’s legal rights and material welfare. Period. But the leaders had no authority over the hopes and fears associated with spiritual matters, and the life hereafter.

Others joined in the discourse. For Richard J. Cartwright, there were two issues that could lead to the loss of liberty. The first situation occurs when hereditary rulers from aristocratic and oligarchic backgrounds manage to attain positions of power within the governing body. The second is when rulers professed to represent the people so they could obtain power but, then, later exploited them, essentially making rules in defiance of the people’s wishes. More to the point, he opposed governments taking actions that fail to protect minorities and individuals from authoritative overreach.

Mr. Cartwright went on to say: “I think that every true reformer, every real friend of liberty will agree with me in saying that if we must erect safeguards, they should be rather for the security of the individual than of the mass and that our chiefest care must be to train the majority to respect the rights of the minority, to prevent the claims of the few from being trampled underfoot by the caprice or passion of the many.”¹⁰⁵

From these multifaceted commentaries, it was evident that any direction taken toward the establishment of a Constitution for a Dominion from sea to sea to sea must involve steering away from the possibility of tyrannical dictators. From this stance, the following question is asked: Should there be some basic rights ascribed that no amount of majority can trample? Isn’t this the gist of the Constitution?

George-Étienne Cartier considered the underlying motivation that had made England great, comparing it to the vision he wanted to see Canada embrace. He asked, “Had the diversity of race impeded the glory, the progress, and the wealth of England? Had they not rather each contributed their share to the greatness of the Empire? … In our own federation, we should have Catholic and Protestant, English and French, Irish and Scotch, and each by his efforts and success would increase the prosperity and glory of the new Confederacy.”¹⁰⁶

¹⁰⁵ March 8, 1865.

¹⁰⁶ Cartier, George-Étienne. February 9, 1865.
Looking into the future, T.L. Wood asked, "What would happen if Ottawa were ever so amiable and ever so pure that the moment citizens felt the yoke tightening, would the people repent?" For those not as familiar with the Scriptures, the term revolt may seem like a better fit than the word repent. By way of explanation, the people of Israel in the Old Testament often turned to the worship of small gods and idols. Whenever the Israelites did this, their nation would stop prospering. Many times, this led to the Israelites becoming slaves. When they finally repented and asked the Lord God’s forgiveness, Israel would become a blessed nation again. Mr. Wood’s reference then suggests that when Ottawa tightens the yoke, it’s because the people have turned away from the Lord God, and the only way to return to becoming a blessed nation is by recognizing, once again, God as supreme.

John Sanborn concluded that to render a constitutional obligation secure, it must first be in the hearts of the people. He, too, asked the question: “Why was it that the English had always resisted attempts upon their Constitution?” His response? “Because every link of the great chain had been conquered by resistance to oppression, and by sacrifices of blood, by resistance to royal exactions and assumptions, and these achievements were preserved, held dear, understood, valued, and clung to with all the tenacity of that great people’s nature. This was the reason why it rested upon such a solid foundation, why it had endured so long and was likely to endure forever.”

All this to say that within the founding debates, there was considerable latitude to discuss the status of religion within the context of responsible government. Unlike the U.S., where the separation of church and state are clearly defined constitutionally, Canada created a distinctive Constitution, the British North America Act, which remained completely silent on the standing of churches. Translated, this meant the founders, as ardent defenders of religious liberty, had no intention of churches becoming subject to temporal governments and popish-type supremacy.

Certainly, the founders had choices. It wasn’t like the topic of religion, faith, and Christian conscience was not on the table. It most certainly was. Yet, when the founding constitutional documents were signed, any reference to church status was nil. In effect, the BNA was wholly about governance in the physical realm, yet nothing was defined in the spiritual.

This non-acknowledgment of the church was further confirmed in the 1982 Charter of Rights and Freedoms. Think of the rule of law, and God, and the federal and provincial powers as separate pillars. Each can be likened to a pillar, but in Canada these pillars do not intersect. If they did, they would not be pillars. When federal and provincial powers overlap, the federal power has supremacy. Similarly, the Constitution, under the supremacy of God, has supremacy over federal powers. This is why the Constitution defines federal power. Therefore, the status of the church, from the viewpoint of citizens, has not changed since the founding of the nation in 1867. The Charter simply reaffirmed the position of the authors who initially created the British North America Act.

107 March 10, 1870.
Again, the Canada Constitution inclusive of the Charter does not define church and state as interrelational. What the Charter does do is rightly reaffirm the constitutional guarantees and protections of churchgoers. As Canadian citizens, these congregants have the same rights as other citizens to freely assemble and associate. By extension, congregants from all faiths (or non-faiths) can freely worship without opposition or disruption from governing authorities.

The underlying premise, then, is simple: state authority starts and stops with the administration of justice and fair laws. Government responsibilities extend solely to ensuring orderly social structures are maintained, as it pertains to the life, liberty, and security of the populace it is installed to represent. As evidenced, the BNA clearly defines the powers allotted to federal and provincial jurisdictions. Section 91 of the BNA defines the federal and provincial powers.108

Conversely, the body of Christ Church is solely responsible for overseeing spiritual matters under God. These are not intertwined responsibilities wherein the church shares these obligations with governments. Neither are these overlapping responsibilities where the prevailing government could assume a fine line between government’s obligatory duties and the churches’ spiritual authority. In actuality, the silence between these two pillars concludes the state has no authority to bind men’s consciences because all authority, including the power to forgive sins was already wholly given to Jesus. As the Scriptures state, “And ye shall call His name JESUS, for He shall save His people from their sins.”109 Even more obvious, the founders of this great nation had no desire to make churches subject to government.

Therefore, neither government, the judiciary, or state actors can demand Christian churches in Canada—or for that matter, any church or religious institution—comply with government dictates through arbitrary or heavy-handed actions. Alternatively, as witnessed during the COVID pandemic, this could involve civic authorities and law enforcement selectively focusing on religious organizations and outdoor religious gatherings whose beliefs they personally oppose.

Why not? Because the separation of governance and religious powers is, by virtue of their respective roles to the populace, completely independent from one another. There is a distinct separation, even though both pillars are fully accountable to God and rule of law—institutionally distinct because church responsibilities to the state are not defined. Only the state’s obligatory duties to the populace are strictly defined.

108 Section 91 of the British North America Act, 1867, now the Constitution Act, 1867, grants broad powers to the federal government. Its legislative goal is to ensure the peace, order, and good government of Canada. In relation to all matters not coming within the classes of subjects by this Act assigned exclusively to the Legislatures and the Provinces, Parliament would have power over matters of national interest. Issues of regional interest would be given to the province.

So again, what is the church? For Bible-believing churches, there is a strong emphasis on faith and salvation. There isn’t one specific religious denomination universally associated with Bible believers. Instead, it’s a broad term that incorporates various evangelical, charismatic, and independent faith-based assemblies.\textsuperscript{110} Traditionally, these churches emphasize the Lord Jesus as King of kings and Lord of lords, and the Bible as the supreme authority for its beliefs and worship.

Moreover, faith is considered a central tenet.\textsuperscript{111} As well, the emphasis is that salvation can only be obtained through Jesus Christ as Lord and Saviour.\textsuperscript{112} In alignment with Jesus’ teachings, these highlight the power of a believing faith in Him, which in turn, leads to miraculous healings, both physically and spiritually. For example, the Scriptures point to apostle Peter’s shadow healing the sick lying on the roadside as he passed by. Apostle Paul regularly cast out demons from people considered to be insane or mad by society. It is within this context that Bible-believing churches tend to be stronger and more united, both internally as a church and within the community at large. Jesus’ commandment to love one another is a strong component of Christian faith, which often leads to varying forms of evangelism and sharing the Lord Jesus with others.

It should also be stated that not every NCI witness who testified held a Bible-believing worldview or faith to the same degree. This aspect alone signifies the magnitude and breadth of the religious community identified as Christian. This too should prompt an understanding that God did not create cardboard cut-outs. Neither does being created as equals negate everyone possessing a singular uniqueness and purpose. This may explain why painting all Christians with the same brush does not work.

Still, it is remarkable that the testimony collectively led to the same questions, primarily: How were governing authorities able to justify the lockdowns? Where were the churches? And what can believers now do to pick up the pieces of a fragmented social fabric?

Perhaps, understanding how the witnesses viewed church may help. For Wesley Mack, Hon. PhD, church was a fellowship of believers who come together for a common cause—where people who desire teaching and learning can receive spiritual nourishment and, without the threat of external deterrents, can enjoy social interaction with co-worshippers and the pastoral community. Equally significant within the church are the numerous outreach initiatives that support the broader community and demographics at large and, most particularly, cater to the most vulnerable.

\item Ephesians 2:8–9; Hebrews 12:22; II Corinthians 5:7.
\end{enumerate}
\end{footnotesize}
Gospel minister Tobias Tissen added to this definition. He maintained that a church provided a much-needed avenue for socializing and getting together, which includes the exchange of both social and spiritual dialogue. From the church perspective, both he and the congregants who attended felt an obligation to continue gathering. To this end, the church had a duty and responsibility to fulfil scripture and, similarly, not forsake the assembling of the saints, in accordance with the Scripture Hebrews 10:25.\textsuperscript{113}

Other ministers, including Rev. Randy Banks, highlighted the importance of offering spiritual nourishment to patients in hospitals and long-term-care facilities. He reiterated the value and importance of God at the bedside, particularly when, traditionally, this would be a time when people would be at their lowest. But as Mr. Banks also pointed out, spiritual sustenance and healing is not only for palliative patients facing imminent death but also offers much-needed spiritual support for family members and close friends as well.

On this point, Mike Vogiatzakis had an epiphany. Amid a funeral for a six-year-old boy, the police threatened fines if he exceeded gathering limits. An uncle of the boy confronted the director, asking, “What kind of a man are you to keep me from seeing my nephew?” It was here that Mr. Vogiatzakis’ compassion led to inviting both this man and all those waiting in the parking lot to attend the boy’s funeral. He believed that if all the churches had stayed open throughout the pandemic, there would have been fewer deaths. His conclusion? “If we get prosecuted [sic] [persecuted] on earth for doing the right thing, we have another life to live afterwards.”

Jérémie Miller raised concerns that the COVID measures implemented by government were causing division in the community. Early on, he began to question conflicting government messaging, particularly the mantra that suggested it was the citizen’s fault Canada is still coping with a pandemic. He was not an anti-vaxxer. He received the first COVID vaccination. When he returned to get his second vaccination, nurses told him he should consult a doctor. This was because he had experienced side effects after the first vaccination. Big picture, he said church obligations include standing against oppressive policies. He referred to his religious practice and his belief in the right to be protected to live his faith without barriers.

The personal convictions of pharmacist Camille Mitchell led to submitting a notice of liability and a declaration of faith to her employer, the president of Island Health, and the president of the Health Sciences Association. She had been a pharmacist for 26 years. She applied for a vaccine exemption. She was hoping her religious exemption would be approved. However, Ms. Mitchell’s employer never acknowledged her religious exemption. Similar to many other NCI witnesses, religious [and medical] exemptions were either very difficult to get or these were not being honoured.

\textsuperscript{113} Hebrews 10:25.
One of these witnesses was nurse Grace Neustaedter, who testified of her strong personal faith. She held a master of science in nursing. In the beginning of COVID mandates, Ms. Neustaedter thought the vaccination was a reasonable precaution. Because of her research and knowledge, she also knew a vaccination would take five to ten years to be properly tested. She soon realized the required clinical trials and Informed Consent could not happen within the COVID time frame. She also heard health professionals denigrating the unvaccinated, even when these same patients could hear them. She eventually walked away from the career she loved. The irony was, on the same day she was prohibited from setting foot on Alberta Health Services property, she received her 40-year employee recognition plaque.

Ms. Neustaedter’s religious exemption was denied. She never even heard back from her employer after the exemption was received. She did hear that only one exemption was accepted, and this was for a non-Christian. Ms. Neustaedter continued to attend the same church her family had participated in for more than 40 years. She was surprised people didn’t question the COVID restrictions. Some said it was all part of God’s plan. Others swore at her husband, who physically couldn’t wear a mask. She observed that people were more concerned about their own health and welfare than what Jesus would want them to do. They began attending a new church that had intentionally remained open.

Brandon Pringle also felt a firm commitment to religious freedom. In his case, he was persuaded that like-minded believers should not be prohibited from gathering. As he testified, he spoke to the societal breakdown that occurs when churchgoers are prohibited from meeting. Prior to COVID mandates, Mr. Pringle’s family was very close. Family and church events were a regular component of family interactions. They all attended the same church. When the mandates went beyond the two weeks to flatten the curve, Mr. Pringle spoke with his adult children. From a faith-based perspective, he outlined his concerns about emerging tyrannical mandates. They agreed to disagree. He didn’t realize how bad it was going to get. At one point, his son-in-law claimed the reason COVID continued was because the unvaccinated would not comply. Using propaganda, the media had launched a campaign intended to target the unvaccinated. Mr. Pringle was saddened that his once close-knit family was becoming divided.

Patrick Allard was a member of the Manitoba Group of Five. He organized his first protest on May 9, 2020, in front of the Legislature. He called the rallies “mental health rallies” because it brought people together so they were not alone. He missed church so he attended an outdoor drive-in church. He was arrested for shaking hands and hugging people. He said he was treated like a criminal by the police. His bail conditions stated he could not communicate with certain people. He compared the rallies to the government-approved Manitoba Hydro Union and Black Lives Matter demonstrations. He said these were scheduled during COVID mandates too. The difference? There were no arrests in the latter government-approved demonstrations.
Mr. Allard thought Canada might go down this path again in the future and thus, in his opinion, there’s nothing Canadians can do but continue to stand. It doesn’t help, as witness Mr. Pardy pointed out, that the courts were dismissing the evidence of those challenging the rules, or that the constitutional rights and freedoms of citizens were not being honoured by the courts. The question for Mr. Allard then was simple. If the courts were not willing to sort out COVID rules because it would be similar to serving a political function, perhaps it was time for God to intervene.

Dr. Gerald Bohemier said red lights began flashing when everything he had learned in science and in his profession as a chiropractor was contrary to the government messaging on COVID. When attending rallies, he observed a constant police presence. The police recorded the attendees. He was arrested and, from his testimony, not treated very well. The legal protections put in place to protect citizens from unnecessary detainment were not available. He spent the night in jail.

Dr. Bohemier also attended a drive-in church. He knew church services were purposeful and the rights of citizens constitutionally protected. Therefore, religious services could not be interrupted by government authorities. Ironically, Dr. Bohemier was led to remind the police of Criminal Code 176, which prohibits any person from obstructing officiating clergyman, disturbing worship or meetings wherein an assemblage of persons meets for a moral, social, or benevolent purpose. He alluded to the police officers committing a crime. Section 176 specifically states:

**Obstructing or violence to or arrest of officiating clergyman**

- **176 (1)** Every person is guilty of an indictable offence and liable to imprisonment for a term of not more than two years or is guilty of an offence punishable on summary conviction who (a) by threats or force, unlawfully obstructs or prevents or endeavours to obstruct or prevent an officiant from celebrating a religious or spiritual service or performing any other function in connection with their calling, or (b) knowing that an officiant is about to perform, is on their way to perform or is returning from the performance of any of the duties or functions mentioned in paragraph (a) (i) assaults or offers any violence to them, or (ii) arrests them on a civil process, or under the pretence of executing a civil process.

- **Marginal note: Disturbing religious worship or certain meetings (2)** Everyone who wilfully disturbs or interrupts an assemblage of persons met for religious worship or for a moral, social, or benevolent purpose is guilty of an offence punishable on summary conviction.

- **Marginal note: Idem (3)** Everyone who, at or near a meeting referred to in subsection (2), wilfully does anything that disturbs the order or solemnity of the meeting is guilty of an offence punishable on summary conviction.
Pastor Steven Flippin described how *Criminal Code* 176 was breached when the church he was involved with reopened. Two factors contributed to the decision. First, if the legislature was willing to delegate their rule-making authority to unelected officials and, likewise, the church fell outside of the government and judicial jurisdictions, it only made sense for the church to restore its servitude status of helping others. Relying upon the Scripture in Hebrews 10:25, Mr. Flippin said Christ commands us not to be subservient to government. Indeed, he reaffirmed Christ’s desire that we all come to Him.

It should be said, however, the decision to open was not made in isolation. Both the elders and church members consulted together. In time, both the police and health authorities were knocking at the door. Fines were issued. He was told that no court would accept *Criminal Code* section 176 in the same way the church interpreted it. Even though statutes are in place to protect the church from those who would obstruct services, this did not stop the authorities from spying on the church. Eventually, the church was prosecuted and Pastor Flippin forced to take the fines personally. Nevertheless, he said there were wins: attendance doubled; those who attend include young families, new immigrants, and everyday Canadians.

But not everyone was a winner. Mildred Kucher, a woman in her 90s, regularly attended church. Pre-COVID, she was constantly socializing with family and friends. In this regard, the church was more than just a place to go but essential. It might be important to note here that Ms. Kucher was a social butterfly. In fact, as her daughter suggested, it was difficult to get an appointment to see her. Of course, when the churches closed, everything changed for Ms. Kucher. She had always said she didn’t want to die of loneliness, but in the end, it was loneliness that led to her passing. For so many reasons, David Leis’ testimony hit the nail on the head. Never before in the history of Canada has there been such a policy disaster. “Canadians relied on institutions on the assumption that they would serve them, but instead they were let down.”

Through no fault of her own, Ms. Kucher had become a casualty.

Witness Don Woodstock ventured down a different road. He was so adamant that churches were essential and, therefore, should be open that he started a petition that would pave the way for church congregants to hold services in big box stores. As a business operator in the security business, he understood firsthand the COVID fear instilled in clients. For Mr. Woodstock, the paranoia that pit neighbour against neighbour, dividing communities, had gone too far. It was time to rise above the damage caused by COVID policies.

---

Another witness, Steven Setka, shared Mr. Woodstock’s motivation to challenge the prevailing COVID mindset. He raised concerns with his church leadership regarding vaccination passes. The church had reserved a section for undeclared individuals. Within a church of a thousand people, Mr. Setka was the only churchgoer in the unvaccinated seating section. He had since changed churches, which included adjusting to a new social circle. Being deemed an outcast by both his extended family and his church led to a lot of anxiety, depression, and loneliness. In part, he blamed not having a strong, supportive community around him for his struggles. But it wasn’t just churchgoers who were at odds with how churches dealt with COVID measures. Pastors witnessing the negative impacts of COVID lockdowns on the social fabric were not always welcome either.

Pastor Jason McVicar’s experience specifically shows that not every church is the same. Just like so many entities within society, there will always be some that more effectively meet the physical and spiritual needs of the people they serve, and some that will not. In Pastor McVicar’s case, the Board of Directors within the church did not align with his stance on vaccines. Even though the government offered bribes in the form of opening to full capacity if the congregants were vaccinated, Pastor McVicar did not concede his principles. Instead, he parted ways. In so doing, he was able to find a welcoming congregation that did not take issue with his unvaccinated status.

Like varying denominations, leadership roles within the church can differ too. For example, Mr. Tissen did not consider himself to be a pastor. Rather, he considered ministry to be a higher calling. In part, this could be because the role of pastor is often linked to professional employment, whereas ministry is when one willingly chooses to serve others.

Mr. Mack considered himself to be an elder. He said he missed in-person church services. Having spent most of his life working in the church community, COVID measures leading to the closure of assemblies represented a significant change. Although he was still able to watch church services online, he said it was not the same as physically going to church. Christians are called to fellowship, serve, and support one another. COVID restrictions prevented Mr. Mack from giving back to the community. To him, this was a significant loss. He also lost friends because of church closures. Social interaction with like-minded co-worshippers had ended. He said the lack of interactions with the pastoral team left a gap. In terms of the broader community, outreach initiatives were suddenly put on hold. He found the spiritual nourishment that he was used to receiving in his day to day lacking. He was further deprived of visiting family due to border closures.
Mr. Tissen also confirmed the far-reaching impact of COVID measures and lockdowns. First, the church with 160 congregants had been shaken by the actions of police and health authorities during the pandemic. The broader community was divided. At home, his family, too, had suffered from actions taken by government. His children were traumatized by the very police they had been raised to respect. He further alluded to a family get-together in the park. After being widowed, his mother had made plans to return to Europe. It was kind of like the last supper. But instead of a family memory, she watched her adult son arrested and pulled out of reach by state authorities, as if Mr. Tissen was some sort of hardened criminal. His crime? Ministering the good news gospel of the Lord Jesus Christ to those seeking the purpose of life. And, as he indicates, showing others, by his own example, how to love their neighbours.

At 28-years-old, this family man had a much deeper understanding of right and wrong than the RCMP officers who chose to arrest him: These same officers who watched Mr. Tissen bury his father. The same detachment of officers who believed it was within their authority to block the church entrance from congregants who desired to worship the Lord. As another NCI witness observed, the police were on the wrong side of the law.

As an aside, the church of God in Steinbach, Manitoba, had zero COVID outbreaks, no deaths, and everyone to the day of testimony, were still in good form. Mr. Tissen confirmed that in the beginning, the restrictions were novel, and like everyone else, the church family stayed home for a bit. But when they realized people should be there for one other and there was a calling within the Scriptures to do so, the church moved to drive-in services. The scriptural reference refers to believers not forsaking the assembling together, as the manner of some, but instead, exhorting one another, and so much the more, “as ye see the day approaching.”

Mr. Tissen said there was no division regarding the decision to reopen the church. He said the congregation remained in one accord, like a family should be. He observed drive-in church is not the same as physical and social interactions with other believers. Still, when the church acted on their constitutionally protected right to serve God in a manner that historically in Canada could never lawfully be restricted, the church became a target.

Witness Dr. Francis Christian likened many of the actions of governments during the COVID pandemic to the tyranny found in the Soviet Union. He pointed to how the data disseminated through media and health authorities was meant to deceive the public. He also commented on how data was used to frighten and manipulate the population. Although most of Dr. Christian’s testimony focused on vaccines, he spoke about the persecution against anyone who speaks outside of the prevailing narrative. This was an outcome for churches that reopened in Canada had become all too familiar with over the last three years.

115 Hebrews 10:25 King James.
Again, not everyone was going to stand by and watch Canada destroyed. Rick Wall identifies himself as a God-fearing man and praying father. During the pandemic, he missed attending church. As the business owner of a trucking firm, he became suspicious of COVID measures early on. Mr. Wall participated in an outdoor drive-in church because he felt violated that his right to worship the Lord freely was taken away. This was about the same time outdoor gathering sizes were decreased to five persons. Almost one hundred people attended the first outdoor church service. Consequently, everyone who attended received fines for non-compliance to health orders. When the truckers decided to travel to Ottawa as part of the Freedom Convoy, Mr. Wall and his wife prayed about it. They were willing to lose everything to stand for what was right. The couple were both at peace over the decision. On January 17, 2022, truckers went from zero to hero. The truckers had captured global media attention.

Mr. Wall said the non-compliance order was consistent with an outdoor sermon he heard. At the outdoor services he attended, there was always a police presence. Mr. Wall did not ask why the gathering numbers for both indoor and outdoor church services were the same. Nevertheless, it might be insightful to understand what the Lord Himself said: “Who hath measured the waters in the hollow of His hand, and meted out heaven with the span, and comprehended the dust of the earth in a measure, and weighed the mountains in scales, and the hills in a balance?”

It is important to note that in these examples, as witness David Leis alluded, it would appear Canadian society is moving closer to authoritarianism. He said it was so sad that people have forgotten their role in serving people. Others might suggest the landscape witnessed by the public was the contrast between good and evil.

Retired OPP officer Vincent Gircys agreed. He admitted tremendous mistakes had been made because of COVID, and that police forces had violated the oath each officer had taken to uphold the law and serve the community. These deliberate blunders by authorities were like a festering sore within the profession he had been so very proud of, not that many years prior. It should be noted that upon retirement, Mr. Gircys had received an exemplary service medal for his years of service. Yet, as Mr. Gircys testified, he was also concerned with police behaviour.

Watching the deployment of 200 police officers on horses shutting down one single restaurant led him to question how police actions were being taken against citizens. Further, on multiple occasions, he witnessed the tyrannical behaviour of the Aylmer police department toward the Church of God assembly. As a former police officer, he referred to the police actions and the continued violations of Canadian’s constitutional rights and freedoms as deplorable.

---

116 Isaiah 40:11–12.
Beyond the criticism, Mr. Gircys commended officers who voluntarily left the Aylmer police force, for these officers did the right thing. He began publicly raising concerns. He referenced the Canadian Charter of Rights and Freedoms as the most supreme law of the land. Most particularly, he pointed to the preamble in the Charter which states, “Wherein Canada is founded upon the supremacy of God and rule of law.” He remembers his early days in policing when he was issued a King James Bible—a Bible he still carries to this day. He was also instrumental in facilitating communications between the Freedom Convoy truckers and governing authorities. For his efforts, he received two arrest warrants, a $10,000 fine, and his bank accounts were frozen.

Witness Richard Abbot, a member of the tactical unit and SWAT team, confirmed these incidents were not just in the public eye but within the police ranks as well. Officers who refused to disclose their vaccination status were subject to segregation and the “Shame Room.” The latter was the workspace designated for the unvaccinated. Even though officers worked side-by-side in shared vehicles and physical spaces, management continued to mandate irrational policies. It was acceptable for officers to work together side-by-side throughout their shifts but not to break bread at the same table.

As a lawyer, Leighton Grey had the pleasure of representing Grace Life Church, and their struggle with Alberta Health Services (AHS) investigators to understand the law. He said the same AHS employees were given extraordinary powers but had no understanding of how to wield them. Further, Mr. Grey testified the health services investigator had the authority to summon police and make arrests, which eventually led to the imprisonment of Pastor James Coates.

Mr. Grey further explained that section 176 of the Criminal Code essentially prevents the disruption of worship services. And, as Mr. Gircys explained, the protocols and procedures that should have been followed for forensic investigations, were not. It is imperative for police investigators to collect physical, documentary, and testimonial evidence before reaching conclusions. This did not happen in the churches cited here. Therefore, the RCMP who accompanied AHS to Grace Life Church failed in a similar manner as the Ottawa police. The police officers did not understand their oath and Constitution, for if these officers had, they would also have known their actions violated both the Constitution and their oath, plus section 176 of the Criminal Code.

Nevertheless, as Mr. Grey admitted, the entire Grace Life Church incident was an international embarrassment. Bruce Pardy, professor of law at Queen’s University, seconded Mr. Leighton’s testimony concerning the law. He reiterated that Canada’s legal system is based upon the separation of the state into three different branches: the legislature; the executive, or administration; and the judiciary, or courts.117 The rationale for these branches being separate is to prevent too much power from being concentrated in any one branch or person.

---

117 The federal government is separated into three branches. Faith assemblies, or churches, are not listed in how government is structured.
Everything other than the elected legislature and the courts falls under administration. This means the administration is not authorized to act without the legislature passing a statute authorizing the action. Under this umbrella, it’s then the job of the courts to enforce the legislation. The emerging issue, as Mr. Pardy stated, is that the legislatures are no longer passing statutes that contain rules for the administration to follow (as the framers of the country did with the British North America Act). Instead, the legislatures are passing statutes which delegate rule-making authority to the administration. Lawyer John Carpay, in his testimony, concurred. He presented a long list of substantive issues and recommendations for the legislative branch level to address.

But what has happened over time is that the administration and not the courts or elected officials have become the experts. To change this direction, the people of Canada must challenge the premise that our government officials have the expertise and authority to tell us what to do in the name of the public good.

The Honourable Brian Giesbrecht is a retired judge. He weighed into the discussion, reaffirming the mediatory nature of the courts to stand between the government and citizens. He was disappointed with the response of the courts to health mandates. He observed tremendous hardship for people. It did not help that the judges accepted the prevailing narrative of governments and health authorities. He pointed to some of the health mandates which, he said, were particularly unreasonable. Moreover, if the courts were simply going to accept any government order as truth, then what was the purpose of the courts?

When the pandemic was first announced, Mr. Giesbrecht began comparing traditional pandemic policies to COVID responses in Sweden. He teamed up with another NCI witness (retired Lieutenant Colonel David Redman) who was experienced in emergency planning. He said it was like Canada was doing practically the opposite of what the planned emergency response called for. When the two compared Sweden’s COVID response to Canada’s, Sweden’s hands-off measures appeared to be doing much better.

He had hoped that by investigating public policy in Sweden, some form of reasonable, objective discussion would emerge. Mr. Giesbrecht was surprised at the hostile reaction he received from mainstream media. He said the media, including the New York Times, wrote a scathing account about Sweden and how people were dropping like flies. This was not true. He questioned the idea that anyone taking a different view to lockdown mandates (beyond conformity and compliance) was discouraged. He noticed people were increasingly becoming divided.
He gave his opinion on how the courts handled COVID, concerning common law and the Charter. At first, he was surprised and disappointed with how the courts responded to the challenges of citizens and lockdowns. The public expect judges to stand between them and government overreach. Generally, this did not happen. The judicial response seemed to predominantly side with the government narrative. That is, if governments and public health make some sort of proclamation, then who are the judges to question them? He believed what the judges did by deferring decision-making and authoritative powers to health authorities in COVID cases was wrong.

He compared some of the decisions coming out of the United States, where there was a vigorous and lively testing of the rules. He believed this was very helpful from a societal perspective. He raised the example of air travel and masking mandates. The difference between Americans travelling on planes without masks versus Canadians still having to wear them was illogical. For months, Canadians were still required to mask, long after masking rules had been removed in the United States.

Courts south of the border had also struck down several of the most egregious vaccine mandates months before these same mandates were put to rest in Canada. Vaccine mandates caused tremendous hardship for people in terms of adverse reactions, employment, and social interactions. If people thought they could go to court and get the most egregious mandates removed, and obtain a reasonable response to their challenge, this might have helped. It seemed people generally did not think the courts were an option.

The primary issue is that deference is given to health authorities without testing the facts or properly looking into the case. The courts are being too quick to accept whatever decisions are made by governments or health officials, taking what the governments present at face value. The dispute is this: If the court is simply going to accept every decision made by governments, then what role do judges play? Why are courts even needed?

Mr. Giesbrecht cited several examples in Manitoba: the outdoor, drive-in church services where congregants remained under surveillance by a huge police presence, the inability of families to hold funerals and say goodbye to loved ones, going for a hike in a park only to discover the trails were closed, and other rules that were particularly unreasonable. Citizens had a rightful expectation that when they attend court, the judiciary would rightly consider all sides of the story and rule accordingly. Not simply to parrot health authorities. In other words, the public didn’t expect the judiciary to privilege the government decision. In this context, this would be considered unreasonable.
Still, people rely on the courts to protect their individual liberties from the dictates of governments. He said it appears Canada is not the same country now as it was before the pandemic. He had spent considerable time thinking about these matters. Citizens need to ask themselves if civil liberties are important anymore or if they are happy with government making all the decisions. Conversely, judges must ask whether they played a role and whether, after three years, the courts protected the peoples’ rights. He expects media and politicians should also ask the same questions.

In a similar context, Mr. Leis said there is a reason Canada has a limited state. It is important because there needs to be room for the working people, which extends beyond Ottawa. He said the government has tentacles everywhere, creating conflicts of interests. He referred to classical liberalism as a cornerstone of Western democracies. Freedom of speech allows Canadians to debate. If censorship is imposed by the state telling the populace what the facts are, even when they are not facts, Canada will not have a future.

This raises yet another question. Will Canada have a future when the courts are closed to the public? As the testimony alluded, the courts were closed. Consequently, there was no avenue for church organizations to file criminal charges against the state for egregious violations of Criminal Code 176. Church congregants were similarly denied an opportunity to address the oppressive actions taken against them by enforcers who swore an oath to uphold the law. There was more than sufficient evidence of wrongdoing. In addition to police reports, health inspector’s notes, private videos and surveillance records, the documentation proving both health authorities and police officers violated this Criminal Code section was overwhelming. Videos of state authorities entering churches during worship services were also prevalent on social media and in the public square.

This unprovoked attack on Christian churches and citizens should have sounded the alarms within the judiciary. At the very least, there should have been a judicial reconsideration of how these acts of lawlessness against citizens could negatively impact the social fabric, and the judicial responsibility to prevent this from happening. Instead, the judiciary and prosecution teams, for the most part, remained silent. Even when congregants informed enforcement officials that their respective actions violated section 176 of the Criminal Code and that, therefore, the operations were illegal, the perpetrators did not stop. Time after time, police and health inspectors were at the church doors, determined to make an example of churchgoers, as if these people were hardened criminals and not hardworking taxpayers. Outdoor churches were not off the hook either. There, citizens were observed and under state surveillance as well. Those who attended outdoor worship services were identified through police video and vehicle licence plates, and subsequently burdened with outrageous fines.
In one example, the police chief attended an outdoor church service in his private vehicle, and he proceeded to video churchgoers in attendance. No warrant was obtained in advance for violating individual privacy. There was no presumption of innocence. There was no randomness. The police actions were deliberate. The rights and freedoms of every citizen were suddenly diminished. Any long-standing principle or tradition that had served Canada well for almost two centuries was suddenly eradicated.

In comparison, there was no police surveillance or enforcement measures at Costco or Walmart. There were no arrests at the Black Lives Matter rallies, even though people gathered at these, too, during COVID lockdowns. Ultimately, the reverberated state message was clear. Any citizen who did not remain in subjection to the prevailing narratives of the state were in complete violation of these new laws—which were not laws, because these were not based on legal precepts or moral tenets, the supremacy of God or rule of law.

As testified, dictated mandates by appointed health bureaucrats superseded the Charter, the Bill of Rights, and now the Criminal Code, too. Most noticeable, as well, the mandates imposed on citizens were not equally applied to those in authority. There emerged instead a two-tier system between the authorities that govern and the citizens being governed. So much for the rule of law. But this leads to further questions in relation to democracy. Is this what lawlessness looks like? When state officials sworn to uphold the law can choose to violate it without legal consequences? That because the courts were closed to the public, the laws that have ordered Canadian society since its democratic foundation no longer matter?118

Again, when the respective pillars in Canada were initially established, it was understood that an individual’s faith and convictions, and their respective religious institutions, are not under man’s laws. Why? Because the Lord has written His spiritual laws in people’s hearts. Every individual knows what is right and wrong. Further, from the New Testament, Jesus summarized all the Old Testament commandments into two. That is, love the Lord with all your heart, all your soul, all your mind, and all your strength, and love one another.119 Therefore, worshipping God is not contrary to the law, for it is embedded in the hearts and minds of the people.120

118 These same questions apply to Criminal Code Section 245.

119 For Gentiles, there are four additional laws found in Acts 15 and Acts 21.

Further, the greatest love story ever told is even more profound because even though men and women transgressed the laws (because we can’t possibly keep them), the Lord Jesus changed the ordinance completely in order to establish a brand-new law: the law of love. This isn’t a competition. From the very beginning, the Lord God wanted to walk in the cool of the afternoon with His people. When His people just didn’t get it, He made a way where there was no way. He stepped down from glory so that each and every one of His beloved creation could have abundant life in Him. The rebellious will not hear the Word of the Lord. But for those who hear His call, we need to understand that God dealt with humanity before the law was given—in the time of Abraham—wherein we were saved by faith. His plan, even before the foundation of the earth was established, was to fulfil the law once and for all. This Jesus did through the shedding of His own blood.

In this context then, where there is no law, there is no transgression. The law was simply to point us to the Lord Jesus, and when we meet Him face to face, heart to heart, the sins that He paid for are taken away. The bottom line, then, is this. Believers in the Lord Jesus no longer need a grocery list of do’s and don’ts telling them how to live. Because the hearts of believers are in Christ. His righteousness dwelling within, showing and enabling believers how to live. Apostle Paul summarized this best when he said, “The only thing that counts is faith expressing itself through love.”

Therefore, on its own standing, the Bible supersedes the laws of men. As law-abiding citizens, Christians are responsible to a higher authority—this same Master that this entire nation is founded upon—the supremacy of God. As Apostle Paul reminds, the letter of the law kills but the Spirit gives life. In this new era, the Lord did something that hasn’t been done before. He called us into a different life wherein there is liberty and freedom for one and all. Not just so people simply cope or chore away day to day in the mundane but that each and every man and woman has a higher calling that is glorious.

---

121 Matthew 5:17-18; Romans 10:4.

122 Hebrews 7:27; Hebrews 8:12; Hebrews 9:12-14, 26-28; Hebrews 10:10-22; 1 Peter 3:18; Romans 4:15; Romans 2:13-23; I Corinthians 6:1; Jeremiah 32:23; Ezekiel 18:5; Isaiah 8:20; Psalm 19:7; Psalm 1:2; Psalm 37:31.

124 II Corinthians 3:3-18.
Pastor James Coates from Grace Life Church understood the difference between man’s law and God’s and, as such, was willing to stand on his convictions and faith to ensure God-given rights continued to be honoured by the state. As a Bible-believing church, the congregants also believed in their scriptural obligation to continue meeting in person. This led to the decision to open in spite of health restrictions. Pastor Coates was ticketed and arrested in February 2021. He was given strict bail conditions. If he were to accept the conditions imposed, he would be breaking his promise to God. If he did not, he would be in contempt of court for holding church services. For the latter, he could face criminal charges. Mr. Coates refused to bow to the dictates of government bodies. The question for him was: who is God—the state or Jesus Christ? For his response, he remained in jail for 35 days. Even though he was not a flight risk, he was placed in shackles on both his feet and hands. Eventually, there was a satisfactory resolution reached on the bail conditions. The Crown released him and Grace Life Church continued to meet.

In March 2021, the church building was seized. A triple-fence with 24-hour surveillance was installed by the state. It was shocking and unprecedented for this to happen in Canada. The Grace Life congregation went underground. Legal counsel James Kitchen met with the church every week to determine how a church of 500 to 800 people could continue meeting while evading the authorities.

Mr. Kitchen was a member of the Law Society of Alberta. He practiced constitutional, administrative, and criminal law. He fundamentally believed the law was unjust and it was his moral and ethical duty to help the church end the unjust law. The church found locations in the middle of nowhere to meet. He recalled how the church was being sought out by authorities. When they had met twice in a row in the same location, a van with a canine unit showed up at that same location the third Sunday. The church had already switched locations, so they were not there.

Another example was Pastor Tim Stephens from Fairview Baptist Church in Calgary. The congregation met in a mountain provincial park beside the city of Calgary. The pastor preached from a tent. There were reports a helicopter was circling around, watching the congregation. Mr. Kitchen reminded the audience that as a nation we cannot forget the persecution of these churches. The measures taken were unjust and motivated by a public health or health crisis. The constitutional structure, Canada designed to protect citizens and their freedoms, was failing.

Mr. Kitchen was in attendance both times Mr. Stephens was arrested. Both arrests were in front of his children. An hour before Pastor Stephens’ second arrest, the police called Mr. Kitchen to let him know their intent. There was no obligation to call him. Mr. Kitchen immediately called Sheila Gunn Reid from Rebel News, who had a cameraman in Calgary. Rebel was able to deploy them just in time to film the arrest. He said there are other churches facing similar consequences.
Pastors Tracy and Rodney from the church of the Vine in Edmonton prevented a public health inspector from coming into the sanctuary during worship service. As a more charismatic church, they believe church services are a sacred and divine time where the Spirit of the Lord is present. Having someone attend strictly to gather information and observe, with the intent of shutting the church was seen to be disruptive. Ideologically and spiritually, such a government official was an enemy. The church was right. Subsequently, the church was ticketed for obstruction.

During the trial, Mr. Kitchen argued it was a breach of section 2(a) of the Charter of Rights and Freedoms. This section guarantees religious freedoms. The prosecutor applied to the court to not allow Mr. Kitchen to argue that religious rights were violated, declaring that this would amount to wasting the court’s time. Mr. Kitchen did not expect the court to agree with the Crown. Mr. Kitchen was going to be in court the week following the NCI testimony. He was appealing this court’s decision. He said it should have shown how hollow and meaningless section 2(a) of the Canadian Charter had become that freedom of religion could not be argued in a court of law anymore.

Mr. Kitchen explained the importance in caring deeply about what happened in these cases. Freedom of speech goes hand in hand with freedom of religion. If the nation does not keep freedom of religion, it will not respect a citizen’s right to protest either. He further explained, these transgressions of the law don’t just apply to Christians. Atheists would not be permitted to speak either if Christians can’t retain their freedom of religion. He reaffirmed these democratic rights are interwoven fundamental freedoms so we cannot keep one and discard the other. It is for this reason all Canadians must care about what is happening to Christians during COVID lockdowns.

There were similar considerations in other provincial jurisdictions. For example, when the province of Ontario moved to a five-tier coloured system, the COVID measures varied, depending on which region one lived. Toronto, for example, was a red zone, which meant total lockdown for residents. Mr. Mack pointed to the hypocrisy that existed between COVID measures for churches and big box stores. By the beginning of 2021, pockets of resistance were beginning to emerge. A couple of pastors were arrested and fined for speaking out publicly. Most churches at this time remained closed.

It was almost a year later before he saw the church fight back. An archbishop appealed to the Premier of Ontario to allow churches to open for Easter. The archbishop’s request was turned down. He was not sure if the three churches he was involved in (including a mega church with 5,000 congregants) had corresponded with governments. But he did say that as a consequence of government mandates, the gathering numbers for churches had decreased across the country. Many within society had given up on the church community entirely because of everything that happened. He noted that independent churches seemed to do better. Nevertheless, some churches were forced to close and sell their buildings and assets.
When the churches were finally permitted to open again, congregants were required to wear masks, social distance, and be vaccinated. The unvaccinated had to sit in more secluded seating areas, away from congregants. It’s also important to observe that even after all COVID mandates were lifted, some religious institutions continued to enforce masking and social distancing measures within the church buildings. Who made the decision within the churches? Mr. Mack said that in the three churches he was involved in, there was a church committee that decided how the mandates applied to the church. These committees would also correspond with the congregants, ensuring that all three churches followed COVID measures.

In terms of impact, many believers said there was a loss. Many congregants lost touch with friends. Contributing to the church community failed to happen. Whereas pre-COVID, maintaining regular worship and devotions was integral to family connections and/or social interactions, now there was a loss. The Freedom Convoy provided some optimism. When Mr. Gircys attended the Freedom Convoy in Ottawa, he saw more hugs than at an Italian wedding. The crowds were peaceful, positive, and joyful. He did not see violence or concerns. He said CBC lied about the Convoy. Mainstream media reports contributed to the emergence of a police state. The Ontario Provincial Police (OPP) admitted the intel was inconsistent with what the media and government were proclaiming.

Instead, the police accepted a single side of the narrative, even when counter information was available. In the end, police departments caved to political pressure and interference. This, he said, is why police agencies should always remain at arm’s length and separate from politicians. He further explained that police officers are just ordinary people who are capable of great violence if they are lied to or led to believe they personally could be in grave danger. There was political pressure and interference.

Mr. Grey’s testimony alluded to a report commissioned by the Alberta Government. It was intended to determine from a psychological perspective what language and methods could coerce Albertans to comply with the vaccination mandates and lockdown restrictions. He said the number of unknown deaths has increased seven times since the vaccines rolled out. Witness Jody McPhee’s father could certainly have been considered one of the seven-fold statistics.

The determination of religious exemptions of religious exemptions coupled with employment termination has led Ms. McPhee to navigate through the court system, along with several thousand others. Mr. Grey said employers, governments, and unions conspired together to force favourable outcomes. Although Ms. McPhee did not specifically address her faith beyond experiencing a lack of compassion from authorities, it can be said her personal convictions and beliefs contributed to her job loss, particularly given the reference to Christ in her termination letter.
Mr. Tissen offered additional insight into possible government motivations. He received considerable support from friends, but he and his family also experienced a lot of hate too. It was all part of the government’s tactic to divide humanity. He said if the government had the resources to send that many officers to a church, or by extension, to his home, why couldn’t these same funds be used to check in on people and ask how they are coping, and, as well, to allow citizens to use their own judgment and common sense when it came to the potential risks associated with COVID.

He spoke of how his three children were traumatized from witnessing their father’s arrest and the multiple times police officers came to the house to hand out tickets: not just one officer. Sometimes, there were as many as five officers at the door. He saw one of his children peering into the police station to see if they could see their father. He said the entire incident was heart-wrenching. Beyond the church, the private school associated with the church was also greatly affected. There were no end-of-year ceremonies for students or family picnics.

He too saw the hypocrisy of government policies that allowed big-box store parking lots to be full, while church parking lots were arbitrarily closed by RCMP. He noted the congregation is made up of peaceful, law-abiding Christians who were prevented from peaceful assembly and worship. Mr. Tissen cited the car rally event for the farmers in India as an example. Unlike the church gathering, no one in attendance was fined or in trouble for organizing these events. There was also the group of solidarity protesters raising aboriginal political concerns who were not targeted by RCMP either.

Mr. Tissen did not point to these groups to raise contention but rather as a point of comparison, showing the inequalities in how consequences for contravening COVID dictates were applied. He reaffirmed that neither he nor the congregation were being rebellious for the sake of being rebellious. He believed churches are instrumental in supporting individual’s faith journey in addition to spiritual support.

**Conclusions**

When asked his opinion on church closures, Mr. Mack suggested more resistance from the church as a collective might have changed the societal outcome. Sadly, many have given up on attending church because of everything that happened. While some churches attempted to resist and hold services, they were fined. He recalled seeing videos of police physically removing and arresting pastors from the few churches that stayed open. These actions by governments against their own citizens in Canada caught international attention.

What was the reasoning? Canada is now contravening freedom of religion because it no longer adheres to or has a desire to understand Christian principles. How far is this going to go? Retired OPP officer Mr. Gircys probed a little deeper. He asked, how are we going to be treated if the lies continue, knowing that police officers are ordinary men and women? There is nothing in the police training that would inform officers differently. He concluded by saying what happened with COVID needs to be exposed. The idea that the pandemic was so dangerous that it justified all these public policy decisions is what he names the “Great Lie.”
Mr. Gircys believes the lies are endless. But to keep the regime going, there must be more lies. When this happens, it is an indication of a totalitarian regime. If you control healthcare and can censor people, if you control education that indoctrinates, if you restrict movement as in fifteen-minute cities, and many more examples too numerous to cite, this is the ideal foundation for totalitarianism. Add a fear-based pandemic into the mix, and the result is a police state. Besides, when media works in collusion with government, it is collusion at its best and yet another indicator that all is not well within Canada’s parliamentary democracy.

But there is a way out. Mr. Gircys offered a number of recommendations. First, he believes Canada needs to establish a nationwide COVID-19 forensic task force, vetted by the judiciary and one that is completely independent of government. He said it must also have the authority to issue arrest warrants.

Mr. Gircys provided a rationale for a task force. He said a task force could investigate the failings of the police community during the pandemic. For example, the police failed to adhere to the plan. He said that in policing, there is a plan for everything. Police don’t decide to wing it because the circumstance this time is a pandemic, and they are scared.

He said the police failed to understand the information. Instead, they accepted a single narrative from government and the media and would not accept any counter information. He knew firsthand that concise detailed reports were submitted to the various authorities and agencies, but no one listened. In addition, the police failed to understand their Oath even though section 52.1 of the Charter states: “The Constitution of Canada is the Supreme law of Canada, and any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect.”

It was difficult for Mr. Gircys to witness situations where the police were heavy-handed. In his opinion, the officers were not only ill informed but were provided with false and misleading information. He watched the behaviour of the officers. The police had to have believed there was a serious threat against them or there was a very real possibility they could be harmed. Mr. Gircys repeated that all his observations were consistently inconsistent with what media was saying, which is why he believes the officers had to be given false and misleading information—in order to do what the police officers did.

Still, even if the officers perceived there would be violence, professional and personal opinion should have changed when they saw there was no threat. Continuously, the same peaceful response should have caused the officers to question, particularly when the circumstances the officers witnessed were church women singing, children playing, and men ministering to the congregants. Yet, another question: At what point does one’s conscience kick in? At what point did the officers realize the information they were given wasn’t true?
Is there a valid explanation? Mr. Girays heard one officer say during a debrief that the information came from something he watched on CBC. However, Mr. Girays walked the perimeter of the Trucker Convoy in Ottawa for three weeks and the joy-filled atmosphere never changed. Clearly, the violence came from the police officers. It appears a new contingent of officers were brought in, and it’s very likely these new police officers were primed with various forms of intel, including that they might be dealing with crazy people.

There were other concerns. Lawyers reported the courts were making decisions that found Charter rights and freedoms were not violated, so the Charter could not be used as a legal defence. As such, there was no opportunity to question the discrepancies between restricted gathering numbers for churches and the number of customers permitted in big box stores, even when the square footage in both the church and the stores were equivalent in size. It is for this reason witness Mr. Woodstock started a petition. He thought if churches met in the big box stores, that would solve the issue.

Certainly, the restrictions placed on religion, and more specifically, the Christian faith during COVID, was a concern for members of the public. Many who did not consider themselves to be religiously inclined before COVID started attending. Mr. Tissen said many came to the church who would not normally have ventured in. There seems to be an awakening around why churches were being targeted by governments. Many of these new attendees equated COVID health mandates with gross government overreach.

However, the persecution of Grace Life Church led to heightened awareness of these types of actions across Canada. Legally, Grace Life Church is part of the Ingram case, which is still before the court. Once a judicial decision is made other court actions will follow. A fine of $1200 is the worst-case scenario facing Pastor Coates personally, but the church could end up owing hundreds of thousands of dollars to the state. This is the same state or nation which was established under the Supremacy of God and rule of law. This is the same state in which the framers of Canada’s Constitution decided, by making churches a pillar, that governments had no authority over religious organizations.

In terms of legal recourse, Pastor Coates is contesting the violation of his right to believe under the Canadian Charter of Rights and Freedoms. Other lawyers testified. Mr. Kitchen reaffirmed Mr. Pardy’s testimony. That is, the Canadian government is set up intentionally to divide power so that the legislative, executive, and judicial systems are separate. The courts are the third branch of government. Each branch polices the others so that no one branch can become too powerful. For a long time, this constitutional structure functioned well. However, in March of 2020, the legislative and the judicial branches were shut down. All power coalesced into the executive branch. Now unelected Public Health Officers ruled. He went on to say that power corrupts. Thus, it would have been the job of the judicial branch to exert controls over the executive branch. However, as the public and church congregants are well aware, the doors to the courts were closed.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

When reinstated, the courts now saw their role as enabling government, which allowed governments to act in an arbitrary and oppressive manner for the greater good. Mr. Kitchen observed judges who were afraid for their personal safety throughout the COVID years. He had hoped that judges would recognize that there must be some personal sacrifice attached to their high-level positions. And that attached to the duty and obligation to serve their country, there is an understanding it may involve some personal risk.

Mr. Kitchen knew for himself that he would never wear a mask but watched judges act fearfully. He suspects that judges too are consumers of mainstream media. Judges are appointed by politicians who share their political views. He pointed out that the legal profession over the last 25 years has mostly shifted to the left. Mr. Kitchen observed that judges with a lot of experience dealing with complex Charter issues were not ruling on COVID cases.

The questions then are this: Why are there so few judges ruling against government restrictions? What happened to judicial independence, and the duty to ensure people’s constitutional rights and freedoms are protected? Specifically, the public wanted answers regarding human rights, the harms caused by masking, vaccine mandates and exemptions, general COVID restrictions, and the enormity of fines for worshipping God. Perhaps, the judges who may have formerly ruled in favour of personal freedoms are being prevented from presiding over these cases now. It also appears that chief justices were taking many of the restriction-related COVID cases. This, in and of itself, led to many of the rulings being pro-government and pro-health restrictions.

Another dilemma that emerged is the regulatory capture of professional colleges. Examples of these include the Colleges of Physicians and Surgeons, as well as the regulatory bodies for accountants and lawyers. Similar to the three arms of government, it is imperative that regulatory bodies have independence from the government as well. Indeed, the purpose of these colleges is to resist and criticize government policies while also protecting the public interest. When regulatory bodies choose to wholly support government and criticize and/or remove licensing from their professional members, the message being sent to the public is not only pro-government, but the move is towards tyranny.

Mootness in the legal arena is similarly a concern. Courts don’t want to waste their time on academic debates. Rather, courts want to act on real issues. This leads to the appearance of judges using mootness to help governments promote their actions. In this context, if governments enact a law, it takes lawyers time to launch a challenge, file the court documents, and schedule a hearing date. Then, just before the hearing, government removes the law. Everyone affected by the newly imposed law (yet now removed) is now left with substantial legal costs. The case has not been heard, so therefore, no time was spent in court arguing the merits of the case. Beyond the lack of discourse and constructive debate, there is no recourse either because the respective government has removed the law in question. This happened many times during COVID. In essence, the government could impose tyrannical laws, pull the law before a hearing, and then call any action against government as moot. This means no one could hold the government accountable.
But governments could then reinstate that law or something equally as unconstitutional later. Mr. Kitchen recommended that some judges could be elected to overcome the problems associated with political appointments. He suggested that judges who rule provincially should be appointed provincially. Through the election process, it is more likely that judges will reflect the views and values of the province. Mr. Kitchen estimated that conservative judges are now outnumbered eight to one in Canada. He also pointed out that often, judges with left-leaning opinions are not always tolerant of their colleagues’ conservative voices.

Mr. Kitchen said it has taken a quarter of a century to arrive where the judicial system is now. It will likely take just as long for the system to recalibrate back to adherence to the rule of law and the Charter. He believes the *Charter of Rights and Freedoms* has been rendered useless. To change this, the Charter may require amending or maybe even be discarded. Before the Charter, very strong decisions had been made by conservative judges in favour of human rights.

Now, with the Charter, those rulings are rare. At the very least, section 1 (which allows the judiciary to limit an individual's Charter rights) must be discarded. Mr. Kitchen believes that a moral society can engage in self-government and subsequently live more freely with more equality. Interestingly, the founders of Canada discussed self-government in their deliberations as well, so this might be a discussion worth pursuing in the days ahead. Regarding judicial appointments, it's a well-established fact that political and bureaucratic favouritism can occur, and this becomes especially problematic when it's seen as nepotism within the context of good governance. Indeed, laws are only as good as the people who enforce them and live by them.

The ethical challenges weave a deeper thread. Imagine how morally bankrupt one has to be to insist that someone submit to an experimental injection or be fired from their job. To prevent these types of actions by the state from taking place in the future, Mr. Kitchen recommended that Canadians stop consuming corrupt mainstream media and seek more truthful alternate news and information sources.

Mr. Pardy suggested new legislation around delegation of parliamentary and legislative responsibility would be a good beginning. He added the Charter likely needs to be revised, since it has been shown to be inadequate. He also called for more transparency in the public service. Mr. Leis went further, saying it is atrocious what has happened and that it was by design that so much information was withheld from the public. He was equally disturbed by a law profession that did not ensure the rightful application of the law. Jordan B. Peterson considered how public opinion was manipulated to justify the imposition of restrictions on citizens’ basic human and constitutionally protected rights.
To counter the conflicting protocols, Mr. Allard cited the insightful example he used to persuade a school principal not to impose mask-wearing protocols on his daughter. He said if his daughter was to be segregated from classmates in the school, then students from every other minority group should also be segregated. Rightly, the principal understood the analogy and the human rights consequences of such a move. Canada’s forefathers had similarly referred to society taking care of its minorities as well, and in so doing, humanity would be all the better for it.

Francois Amalega took a different approach. A resident of Québec, he immigrated to Canada in 2012. When COVID began, he understood the stakes were high. In Canada, the government was trying to take the place of God, but any government posing as a small "g" god would be void of all hope. He believed withdrawing religion from the public square is not the answer.

A mathematician by profession, Mr. Amalega observed the contradictory rules and how the uncertainty was creating anxiety. He said things did not fit. He taught his college students to think critically, and yet the pandemic narrative did not align with the COVID data and statistics. The analogy he used was the government is building the plane, while Canada is flying it. The only conclusion he could reach was governments were lying to Canadians. Instead of protecting citizens, he said they were trying to destroy the social fabric. Not willing to concede, Mr. Amalega began publishing on social media. His Facebook account was constrained. Nevertheless, he kept on going—refusing to wear a mask at the College or in public places. He said by pursuing peaceful civil disobedience, he was fighting the good fight of faith for all Canadians. For not complying to mask mandates at work, he was suspended for three days and later two weeks. The College offered a compromise. They did not want to see him leave. Mr. Amalega resigned, saying he made the choice.

He used the extra time he had on his hands to protest. There was no violence. Every protest he attended was peaceful. The time came for Mr. Amalega to protest inside the police station. He told the police he was looking for freedom again, which was locked up in the police station. By now, he had received numerous tickets and was jailed four times for refusing to wear a mask. He was unsure how many nights in total he spent in jail. One of the mask fines was for showing up in court to fight his fine for not wearing a mask. Another time, Mr. Amalega was held in prison for over three months for being within 300 feet of Premier Legault, who showed up unexpectedly at the protest. Premier Legault allegedly regularly violated 8 p.m. curfews.

When interviewed, he told the media he had won. He referred to the various ways prisoners were treated. He wants to know which judge signed his arrest warrant because to him, that judge is the biggest criminal of all time. Mr. Amalega drew the comparison that if he is condemned, then the judge too is condemned. We are all accountable for our actions and this includes judges.

He understood COVID-19 as a medical story whereby people would say anything as if it were the truth even when there was no proof. Everything is opaque. He said when citizens don’t respond to intimidation and fight for justice, becoming more vocal about the wrongs governments are committing, the people win. And by extension, this nation and all the citizens within Canada will win.
The question was asked: Where does Mr. Amalega get his inner strength? He said it is his belief in God that keeps him motivated to keep standing for what is right. He explained human authority is a gift of God, but like Canada’s founders, he maintained human authority is also beholden to God. Why is this testimony so critical? Because one man believed in standing firmly for his personal convictions, for truth, and for those who cannot stand. In total, he received $98,000 in fines. He had hoped to reach $100,000 before testifying at the NCI. Nevertheless, the point was made. Being a person grounded in faith, standing boldly against unlawful mandates, may come with a personal cost, but the tangible benefits for the good of society going forward are long-lasting.

Is there a spiritual climate change needed in Canada? He responded by saying that when he first arrived in Québec, the topics of politics and religion were forbidden topics, but these are the most important topics within a society. Even non-believers are an important subject. He said it is not good for only one religion to dominate, but to withdraw religion altogether from society is not good either. Why? Because religion offers hope. Government does not offer hope.

Regardless of how one perceives Mr. Amalega’s actions, his sincere, deeply heartfelt testimony is confirmation that COVID is all about a spiritual struggle. The upside, and Mr. Amalega’s message is, when people band together and stand solid on their convictions, the truth shall prevail.

At the end of the day, Mr. Amalega’s insights might prompt churches to require that Canada restore the democratic pillars which have blessed this nation over time. There can be no disorder within a democracy. This means federal and provincial governments cannot abdicate their electoral responsibilities to the public by appointing bureaucrats from health agencies to rule in their stead. When the law of the land is broken, because rulers have decided to act outside the citizens who promote good works, society breaks down. Jesus calls those responsible for social upheaval workers of iniquity125 because they have rejected the Lord’s overriding law of love in the New Testament.

With regard to citizens’ lack of access to courts during COVID, there was no standing for ordinary citizens to bring criminal charges against police and state authorities. In earlier times, Jesus stepped up, becoming a mediator126 between God and man. But who stepped in for hardworking Canadian citizens during COVID? This question requires a response. Because at the end of the day, closed courts essentially gave employees of the state a licence to do whatever they wanted to do. And what happened? state officials chose to disrupt the peaceful order of society and the worship of the Lord in church services by actions that were unlawful.127

125 Psalms 59:2-12; Matthew 7:21-23; Ezekiel 18:30; Psalm 119:133; Proverbs 10:29; Micah 7:8; Titus 2:14; I Corinthians 13:5-7.

126 I Timothy 2:5-6.

The final point: churches are pillars that are not answerable to man-made governments. This foundation was established historically by the founders of this great nation and in Canada’s Constitution. The questions the founders reckoned with will need to be asked once again. In other words, can we enact laws that can infuse life into our nation? Because if the most knowledgeable and wise individuals could discover a law that could bestow life, then Jesus’ sacrifice would have been meaningless. However, on the cross, Jesus exhibited the highest form of love in the universe, and this love represents the Life and Light for our great nation.

May every church understand what it took for each of these witnesses to come forward and boldly stand. The overarching message is that we all, churches included, continue to shine His light brightly.

Recommendations

A. **Recognition of all religions**, including the body of Christ Church, by all levels of government is paramount in a free and democratic society and must be afforded all protections and shields guaranteed under the *Criminal Code*, the *Constitution Act, 1867*, the *Bill of Rights*, and the *Canadian Charter of Rights and Freedoms*.

B. **Churches do not require the permission of governments** to open or close. However, when churches decided to respond favourably to the governments’ call—a two-weeks to flatten the curve—these same churches must also have had the decision-making authority to reopen when projected COVID death and illness numbers don’t come to fruition.

C. **Revisions of the Emergencies Act**. In May 2020, the launching of the *Emergencies Act* granted Cabinet powers to evacuate people and remove personal property from any specific area, acquire property, direct any person or any class of persons to render essential services, regulate distribution and availability of essential goods, services, and resources, authorize emergency payments, establish shelters and hospitals, and impose criminal sanctions. Moreover, the Act allows the federal government to essentially nationalize parts of the economy wherever it thinks it’s necessary, including Cabinet assuming the control, restoration, and maintenance of public utilities and services to ensure the wellbeing of Canadians.

Later, citizens witnessed governments creating travel passes to curtail movement under the *Emergencies Act*. There needs to be parliamentary and legislative revisions to the *Emergencies Act* in an effort to reduce the unprecedented sweeping powers of the federal government over provincial jurisdictions and the citizenry and the unbridled discretion of authorities and powers administering new criminal laws without established opportunities for redress.

---

D. **All governments should be required** to provide full disclosure of all the relevant data that led to the declaration of emergency measures, the degree of parliamentary oversight, the dialogue regarding the risks and legitimacy of the lockdowns, and how temporariness was factored into the invoking of the Act.

E. **Governments and public sector employees** by virtue of public funding must remain neutral. Freedom of religion is a protected right that supersedes the authority and actions of governments. Public policy can neither be discriminatory in how the law is applied. For example, all churches regardless of the number of congregants, the square footage of the building, or the ability for each individual church to accommodate citizens within the boundaries of ever-changing COVID restrictions were painted with the same brush. On its face, the essential and non-essential list of organizations afforded carte blanche government approval appears discriminatory, and therefore, should be challenged under human rights legislation.

F. **Remedy discriminatory conduct** through mandatory education programs. For example, the duty to accommodate is a legal concept that aims to ensure every citizen has equal access to benefits, services, and opportunities. In the context of the Canadian Charter of Rights and Freedoms, the duty to accommodate refers to the principle that individuals and groups should not be treated unfairly or denied opportunities because of their personal characteristics or religious beliefs. In fact, the duty to accommodate places a duty on all employers and service providers, including governments and institutions, to make reasonable adjustments to the policies and practices without unnecessarily imposing hardship on the legitimate interests of a workplace.

Throughout COVID, legitimate questions were ignored. Yet, discretionary discriminatory actions were evident, imposing undue hardship on those who requested religious accommodation. Therefore, mandatory religious education courses for all public sector employees to ensure citizens are not discriminated against for religious practices and beliefs would send a much-needed message to public sector employees who discriminately targeted men and women of faith.

G. **Going forward, there must be a clear**, evidence-based rationale for locking down citizens and society. And subsequently, when the *Emergencies Act* is revoked, there must be ample opportunities for redress, public conversations, and debate in the public square that will counter future restrictions on the citizenry.

H. **Criminal Code section 176** must be retained.

I. **Every individual has an inherent right** to end-of-life, spiritual and/or pastoral care or God at bedside services that align with their specific faith. Therefore, all publicly funded institutions, including hospitals, and long-term care facilities must comply.
J. **Courts must accept deeply held beliefs** for religious convictions and respect that not every citizen, when writing an affidavit to support their views, is familiar with conveying the breadth and depth of their convictions in a manner that would overwhelmingly influence the Court.

K. **The presumption of innocence** must be adhered to in all judicial proceedings occurring in every province and territory but Québec, where the latter operates under civil law. From the evidence, it appears prosecutors have too much influence on how the court uses its time. For example, the statement that constitutional arguments are a waste of court time and, therefore, should not be heard is not acceptable. Again, if a citizen’s constitutional rights have been violated by virtue of their personal beliefs, thoughts, opinions, or expression, the actions of governments must be called into account, or else the law is being brought into disrepute.

L. **Bail conditions must be reasonable and fair** and cannot prevent an individual from performing their employment duties and responsibilities. This includes pastoral service within a religious context.

M. **Separation of courts**, the separation of courts from the public service.

N. **Regarding procedural fairness and natural justice**, it’s time for a comprehensive national dialogue to take place involving the church and Canadians who firmly believe the church is foundational and necessary for the social and economic wellbeing within communities. The church is uniquely qualified and capable of making decisions that impact the social fabric.

O. **The prevailing belief** that there is a higher spiritual accountability in this life which determines our individual standing for eternal life cannot and should not be negated by government or judiciary.

P. **Churches and citizens are encouraged** to create a public policy watch for any legislation that potentially negates the rights and freedoms of faith groups. The attempt to silence religious speech over the last three years should not go unnoticed.
7.3. Economic Impacts

7.3.1. Impacts of Mandates on Small-/Medium-Sized Business

Introduction
The mandatory lockdowns of businesses had a devastating effect on small- and medium-sized privately owned businesses across Canada.

According to Statistics Canada, in 2020 there were 1.22 million employer businesses in Canada, and of these, 1.2 million or 97.9 per cent were small businesses (1 to 99 employees), and 22,725 were medium-sized businesses (100 to 499 employees).

In 2020, small businesses employed 7.7 million persons or 67.7 per cent of the private workforce in Canada, and medium businesses employed another 2.3 million persons or 20.6 per cent of the private workforce. So, together these two types of business employed 88.3 per cent of the entire private workforce in Canada.

Small- and medium-size businesses in Canada account for approximately 51.9 per cent of Canada’s Gross Domestic Product that is generated by the private sector.

At the time of writing this report, Statistics Canada had included on their website “Key Small Business Statistics 2022”; however, many of the comparison graphs included in this “2022” report had not been updated beyond 2019 statistics, and information updates were to December 2021. Updating these graphs to reflect the period of time during the pandemic is crucial to understanding what happened due to the mandates.

These figures from Statistics Canada highlight the critical nature of small- and medium-sized businesses in Canada.

Although the pandemic mandates had an effect on all businesses in Canada, the impact was particularly acute when it came to privately held small- to medium-sized business.

These small- and medium-sized businesses did not have access to the level of resources that were available to support the larger national and international businesses operating in Canada.

As privately funded entities, the majority of small- and medium-sized businesses lacked access to alternative sources of funding for their operations.

Shortages of supplies and materials were most keenly felt by these small- and medium-sized businesses as they did not have exclusive access to suppliers in the same manner that national or multinational businesses did. So many of them simply ran out of supplies.
Labour shortages were also keenly felt by the small- and medium-sized businesses as employees either stayed home or left the labour market due to early retirements or forced mandatory vaccinations.

Many workers who qualified for government assistance stayed home for the full duration of their benefits.

Businesses experienced additional costs due to new requirements for spacial separation, hygiene, and the restriction of facility occupancy.

The terror generated by the government reporting and the media created a toxic and fear-filled environment that caused many employees to fear coming to the workplace.

Small businesses, the backbone of the Canadian economy, were particularly vulnerable during the pandemic. Many were forced to close temporarily or permanently due to lockdown measures and reduced consumer spending. The impact of these closures on business owners, employees, and local communities has been profound.

Even businesses that managed to survive faced ongoing financial struggles, including rent payments, utility bills, and limited access to credit. The government implemented relief programs such as the Canada Emergency Business Account (CEBA) and the Canada Emergency Rent Subsidy (CERS) to provide financial assistance. However, the long-term viability of many small businesses remains uncertain, particularly in industries heavily impacted by ongoing restrictions and changing consumer behaviours.

Catherine Swift testified that many owners of the businesses that she represents reported significant negative impacts due to the various government “support” programs. These effects included the fact that many employees stayed away from the workplace until such time that their CERB benefits ran out.

Tamara Ugolini testified how her small start-up business was destroyed due to COVID-19 mandates imposed by the government, resulting in discontinuation of operations and financial loss.
Testimony Concerning Impacts of Mandates on Small-/Medium-Size Business

**Catherine Swift**
President of the Coalition of Concerned Manufacturer’s and Businesses of Canada; she reviewed the mandate effects on small- and medium-sized businesses.  
(Toronto: March 30, 2023)

**Douglas Allen**
Economist; he provided an economic analysis of lockdown measures.  
(Vancouver: May 4, 2023)

**Chris Scott**
Owner of a café; he described the effects of mandates on his business and community.  
(Red Deer: April 28, 2023)

**Joseph Bourgault**
Owner of medium-sized manufacturing facility; he described the impact of mandates.  
(Saskatoon: April 20, 2023)

**Don Woodstock**
Small security firm owner; he made interesting observations of mandates.  
(Winnipeg: April 14, 2023)

**Darrell Shelley**
Business owner; he described the effects of COVID-19 mandates on his audio visual business.  
(Truro: March 17, 2023)

**Terry Lachappell**
Equipment operator; he lost retirement income due to lockdowns.  
(Truro: March 17, 2023)

**Peter Van Caulert**
Small business owner; he reported on the effects of mandates on his training business.  
(Truro: March 17, 2023)

**Jamie Paquin**
Owner of wine business; he related the effects of mandates and a comparison to Japan’s mandates.  
(Toronto: March 30, 2023)

**Tamara Ugolini**
Family hydrovac business; she described how they were bankrupted by COVID mandates.  
(Toronto: March 31, 2023)
Catarina Burguete
Owner of family brewery and bar; she reported their bar closed due to mandates.
(Toronto: April 1, 2023)

Shea Richie
Restaurant owner; he described the impact of public health measures on his business.
(Winnipeg: Thursday, April 13)

Rick Wall
Owner of trucking company; he described the effects of lockdowns on trucking.
(Winnipeg: April 14, 2023)

Bryan Baraniski
Owner of hotel and restaurant; he recounted the impact of public health measures on business.
(Saskatoon: April 20, 2023)

Zoey Jebb
New business owner with loan from Business Development Bank of Canada in 2019; she ended her business in bankruptcy due to mandates.
(Saskatoon: April 22, 2023)

Louise Wilson
Owner of Dollar Store; she related the impact of mask mandates.
(Saskatoon: April 22, 2023)

Michele Tournier
Owner of chuck wagon racing business; he described the impact of COVID measures on business.
(Saskatoon: April 22, 2023)

Sunje Petersen
Family-owned tourism business in Yukon Territory; she recounted the impact of lockdown measures on her business.
(Red Deer: April 26, 2023)

Tracy Walker
Hairstylist from home; she described the public health surveillance of her business due to COVID measures.
(Red Deer: April 26, 2023)
Conclusions

COVID-19 lockdowns have dealt a severe blow to small businesses in Canada. Many were forced to temporarily close their doors or operate with limited capacity, resulting in significant revenue losses.

The sudden decline in consumer spending and reduced foot traffic had a direct impact on sales, leading to financial hardships, layoffs, and, in some cases, permanent closures. Small businesses often lack the financial reserves or access to credit to weather extended periods of reduced or halted operations.

Small businesses are a significant source of employment in Canada, contributing to local economies and providing livelihoods for numerous individuals. The lockdown measures have led to widespread job losses, with many small businesses unable to sustain their workforce during prolonged closures. Unemployment rates have risen, exacerbating financial insecurity for individuals and families, while reducing overall consumer spending power.

Lockdowns and restrictions have disrupted supply chains, affecting small businesses’ ability to source necessary goods and materials. Import delays, transportation disruptions, and shortages have further strained small businesses already grappling with reduced revenues. These challenges have hindered their ability to maintain consistent inventory levels, meet customer demands, and operate efficiently.

The impact of COVID-19 lockdowns extends beyond economic repercussions. Small business owners and employees often experience heightened levels of stress, anxiety, and uncertainty. The constant fear of financial instability, the burden of making difficult decisions, and the social isolation associated with lockdown measures can have detrimental effects on mental health and overall wellbeing.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

While the Canadian government has implemented various support programs for businesses, including financial aid and wage subsidies, small businesses have faced challenges accessing these resources. Eligibility criteria, application processes, and delays in disbursement have created barriers for many small businesses, leaving them without the necessary financial lifeline to navigate the crisis effectively.

Certain sectors, such as hospitality, tourism, and retail, have been particularly hard hit by COVID-19 lockdowns. These industries heavily rely on in-person interactions and foot traffic, making it difficult to adapt to the restrictions and generate revenue through alternative means. Small businesses within these sectors face unique challenges and require tailored support to survive the economic downturn.

The detrimental effects of COVID-19 lockdowns on small businesses in Canada are significant and multi-faceted. The economic consequences, including revenue losses, job cuts, and supply chain disruptions, have left many small businesses on the brink of closure.

The toll on mental health and wellbeing further compounds the challenges faced by business owners and employees.

As the nation begins to understand the underlying motivation and failure of governments’ actions during the pandemic, it is crucial to recognize the importance of small businesses and the devastating impact governments’ actions had on them. Targeted support to mitigate the losses caused by governments’ draconian and misguided measures is required.

By prioritizing the needs of small businesses and fostering an environment of resilience and recovery, Canada can work towards rebuilding its economy and ensuring the long-term viability of its small business sector.

Recommendations

A. Financial Support:
   a) Simplify and expedite access to financial assistance programs, ensuring that small businesses can easily navigate the application processes.
   b) Provide targeted financial aid to sectors that have been disproportionately affected.
   c) Extend and expand wage subsidies to encourage businesses to retain employees and minimize layoffs.

B. Flexible Regulations:
   a) Implement flexible regulations and licensing requirements to support businesses in adapting to changing circumstances and exploring new revenue streams.
b) Streamline bureaucratic processes to reduce administrative burdens on small businesses and expedite approvals.

c) In cases where governing authorities decided businesses were non-essential, there needs to be accommodation made to allow these businesses to reestablish themselves or in cases where the business has closed, gone bankrupt, et cetera, an understanding within the public service that this is not a consequence of the business owner not wanting to work but a direct result of decisions made by governing authorities.

C. Access to Capital and Credit:

a) Enhance access to affordable capital and credit for small businesses through low-interest loans, loan guarantees, or grant programs.

b) Collaborate with financial institutions to develop tailored financial products specifically designed to address the needs of small businesses during recovery.

D. Promote Local Online Shopping:

a) Encourage consumers to support local businesses by promoting the importance of shopping locally.

b) Develop and implement marketing campaigns to raise awareness of online platforms and e-commerce solutions that facilitate purchases from local businesses.

E. Training and Skill Development:

a) Offer training programs and workshops to small business owners and employees to enhance their skills in areas such as digital marketing, e-commerce, and remote work.

b) Collaborate with educational institutions and industry associations to develop training initiatives specifically tailored to the needs of small businesses.

F. Collaboration and Networking:

a) Facilitate networking opportunities among small business owners, allowing them to share experiences, insights, and best practices.

b) Foster collaboration between small businesses and larger corporations through partnerships, supplier diversity initiatives, or mentorship programs.
7.3.2. Impacts of Mandates on Canadian Citizens

Introduction
The COVID-19 mandates were the greatest and most widespread intrusion into the lives of Canadian citizens that has ever occurred.

COVID-19 mandates were imposed by almost every level of government and were further supported by many institutions and private corporations, including the traditional media.

The tools employed to get citizens to submit included

- arrests
- public shaming
- financial penalties and fines
- denial of services or the threat thereof
- propaganda
- censorship
- secrecy and extensive use of “Orders in Council”
- financial incentives
- isolation
- suppression of the truth

Every aspect of Canadian life was affected.

COVID-19 mandates included the following

- forced loss of employment and denial of employment benefits
- suspension of the Charter Rights and Freedoms
- coerced medical procedures
- breaches in medical privacy
- elimination of Informed Consent
- restriction of travel
- lock-up of, and isolation of, the most vulnerable Canadians, including the elderly
- mandatory lock-ups and quarantines
- tracking and monitoring of citizens’ private communications and cell phone data without a warrant
- suspension of religious services
- suspension of educational institutions
- shutting down of private enterprise
- restrictions of family gatherings
- terrorizing large sections of the population
- institutionalizing/normalizing of hate speech; and hate of identifiable groups
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Laws and mandates that were imposed on the population were enforced unevenly and in the cases of some politicians were not enforced at all.

The impacts to the citizens of Canada and our entire society are devastating and will last for generations to come.

Testimony Concerning Impacts of Mandates on Canadian Citizens

A wide range of testimony was heard from many witnesses located across Canada.

In all instances the witnesses described how the fundamental aspects of their lives and the lives of their families were destroyed.

The terror and propaganda campaign that was unleashed on Canadians caused family divisions and in some instances family breakups. Parent was pit against parent, husband against wife, children against parents; grandparents were denied access to beloved grandchildren, and the most elderly of our citizens were locked away and isolated, left to rot and die in abject loneliness, fear, and depression.

The rate of suicides, drug overdoses, domestic violence, societal violence, family breakups, divorce, and general health problems increased dramatically.

Fundamental institutions of our society were under attack; some responded to protect their rights and traditions, while other institutions completely failed, adopting every measure without question, and enforcing these edicts on their members.

Many churches abandoned their fundamental belief in separation of church and state; they closed their doors and the congregations were left on their own without support, in what was the most trying time since World War II.

The medical profession and the entire medical infrastructure started to shut down and concentrate on an imagined tsunami of COVID-19 illness which never came, meanwhile citizens’ normal healthcare needs were neglected and postponed.

**Excess Mortality During the Pandemic Period**

The testimony of Dr. Denis Rancourt spoke about the rise in societal damage due to the COVID-19 measures, and he claims that based on an analysis of “all cause mortality,” there is indisputable evidence that there were no detectable excess deaths due to a viral pandemic. Dr. Rancourt did testify that there was a rise in excess mortality which was entirely attributable to

- COVID-19 mandates (non-pharmaceutical interventions)
- COVID-19 genetic vaccines toxicity
**Dr. Denis Rancourt**

Dr. Rancourt presented a detailed analysis of all cause mortality data for Canada which provides no evidence of virus mortalities.

*(Virtual testimony: June 28, 2023)*

Dr. Rancourt examined the cause of excess deaths during the COVID-19 pandemic worldwide.

*(Québec City: May 11, 2023)*

Dr. Denis Rancourt provided a critical analysis of all-cause mortality during the pandemic and COVID-19 vaccine rollout.

*(Ottawa: May 17, 2023)*

According to the research of Dr. Rancourt and his team, all of the excess deaths that occurred during the pandemic were caused by the measures undertaken by the government.

**Employment Disruption/Terminations**

Many witnesses testified as to how they lost their jobs due to the mandates, related to forced vaccination with the COVID-19 injections.

Employees who were engaged in public service jobs, private corporations, military, or even volunteer organizations were faced with the unilateral imposition of a mandatory medical procedure, and failure to comply meant losing one’s employment.

In addition, some people were terminated from their employment for exercising their rights to freedom of expression and belief.

Loss of employment struck almost every level of our society from healthcare providers to lawyers, to construction workers, ministers, small business people, teachers, and researchers—just about every area of our society was affected.

To make this situation worse, many of these employees were denied any social assistance through the Employment Insurance plan, and many were held in a kind of legal limbo as the employers called their terminations “leave without pay.”

In addition, unionized workers found that they were not being supported by their unions and were left with no other means of pursuing their rights due to the collective agreements in place.

Testimony was received from the following witnesses:

**Dr. Chris Milburn**

Dr. Milburn was terminated from his position as an emergency room physician due to his expression of his free speech rights.
Dr. Patrick Phillips
Dr. Philips lost his medical licence due to his expression of his free speech rights.

Cathy Careen
She was a teacher who lost her job for not getting a second injection, due to a reaction to the first injection.

Chet Chisholm
He was a paramedic who was banned from returning to work since he only had one injection, due to a reaction to the first injection.

Artur Anslem
He worked for a Canadian railway and was forced to get the first injection. In November of 2021, he had a severe reaction—pericarditis—and was not able to return to work until December 2022.

Terry LaChappelle
He retired from the military and worked on a military base as a civilian contractor. He lost his job due to the vaccine mandate.

Amie Johnson
She was a dental hygienist and lost her job of 22 years due to a vaccine mandate imposed by employer.

Sabrina McGrath
She lost her job at the Nova Scotia Liquor Commission due to a refusal to get the COVID vaccine.

Pastor Jason McVicar
He lost his job as a pastor of a church for his refusal to take the COVID vaccine.

Joe Behar
A New Brunswick civil servant, he lost his job of 20 years as he refused to take the COVID vaccine.

Janessa Blauvelt
A licensed practical nurse, she lost her job due to her refusal to take the COVID vaccine.

Linda Adshade
She was working on COVID-19 data for the Nova Scotia government; when mandates came in, she refused to get the injection and was terminated.

Katrina Burns
She was a substitute teacher who refused to take the injection and was dismissed from her job.

Oliver Kennedy
He was a recreational therapist who was terminated for refusing to get an injection.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Victoria McGuire
She was a registered nurse of 21 years who was terminated from her job for refusal to take an injection.

Rick Nicholls
He was a member of the Ontario legislative assembly who was removed from government caucus for refusing to take the injection.

Lynn Kofler
She was a registered nurse who lost her job due to her refusal to get the COVID vaccine.

Sean Mitchell
He was an advanced care paramedic terminated from his job due to a refusal to get an injection.

Cindy Campbell
An emergency room nurse and educator for 28 years, she was forced into early retirement due to the vaccine mandate.

Kimberley Snow
She lost her job in retail management due to her refusal to get the COVID vaccine.

Ksenia Usenko
A nurse for 15 years, she lost her job in a Rehab Unit as she refused to take a COVID injection.

Jason Kurz
A nuclear technician with working for an electrical power, he lost his job due to his refusal to take the injection and is banned for life from working with a subcontractor of . Essentially, he is barred from working in the industry.

Scarlett Martyn
A paramedic for 24 years, she was terminated from her job due to her refusal to get a COVID injection.

Sean Howe
A locomotive engineer, he was put on unpaid leave for eight months for refusing to get the COVID injection.

Shelly Overwater
A lawyer, she was dismissed from her group practice for supporting other staff who refused to take a COVID vaccine.

Devon Sexstone
He lost his job with a courier company for refusing to take the COVID injection.
Rick Abbot
A police officer for 25 years with the Edmonton Police, he lost his job due to speaking out against the mandates and the actions of the RCMP at Coutts, Alberta.

Jessica Kraft
She lost her job for refusing the COVID injection. She refused due to an existing heart murmur, but she could not get a doctor to give her an exemption.

Michelle Malkoske
A nurse for eight years, all of her shifts were cancelled due to her refusal to get the COVID injection. Her husband was also laid off from his job due to his refusal. They had no income for three months.

Todd McDougall
He worked for thirteen years as a childcare worker and was terminated for refusing to comply with COVID measures of masking and social distancing at weekend protests.

Michel Gagnon
He was forced into early retirement from the military as he did not want to get the COVID injection.

Dr. Francis Christian
A surgeon of 25 years, he was fired from his job due to speaking out against mandates.

Anne McCormick
A former pharmacist working as a pharmacy assistant, she was fired for refusing to wear a mask, despite her medical exemption from wearing a mask.

Cindy Stevenson
She was put on unpaid leave from CN Rail for refusing to get the COVID injection, and while she eventually returned to work, she decided to leave given her concerns about health and safety.

Elodie Cossette
The director for services at a group home, she was terminated for refusing to get injected.

Chantel Barreda
She was a teacher and was terminated from her position for refusing to get the COVID injection.

Danny Bulford
He left the RCMP due to COVID vaccine mandates.

Jacques Robert
He lost his property manager job of 15 years for refusing to take the COVID injection.

Scott Crawford
A paramedic for 30 years, he was suspended from his job for refusing to get the injection. He was not allowed to visit his dying mother in the hospital.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Michelle Ellert
She is on disability leave with adverse COVID vaccine reactions after she was forced to get a vaccine or lose her job. Her mother and daughter each had reactions to the injections.

Babita Rana
She was terminated from her 28-year computer programming position at the University of Alberta for refusing to get the COVID injection.

Grace Neustaedter
A registered nurse for 41 years, she was forced into early retirement due to her refusal to take the COVID injection.

Suzanne Brauti
She worked for the federal government and was terminated due to her refusal to get injected. She was denied a religious exemption and denied Employment Insurance coverage.

Darcy Harsch
He worked with adults with disabilities and was put on unpaid leave due to his refusal to get the COVID injection.

Philip Davidson
He worked for 14 years in the public service in the area of policy development and lost his job due to his refusal to declare his injection status.

Dr. Chris Shaw
A research professor with a PhD in Neuroscience, he lost his position at the university as he refused to take the COVID injection.

Sean Taylor
A military veteran working as a civilian nurse at the time of the pandemic, he was terminated for speaking out on the COVID mandates.

Dr. Ben Sutherland
A researcher for Fisheries and Oceans Canada, he was terminated from his position due to his refusal to take the COVID injection.

Zoran Boskovic
A forester who worked for the provincial government, he lost his position due to his refusal to take the COVID injection.

Camille Mitchell
A pharmacist, she was fired from her hospital job when she refused to take the COVID injection.
Josée Belleville
She was 13 years with the Canadian Armed Forces Special Operations. She was bullied, harassed, and humiliated until they terminated her for not getting the COVID injection.

Gary Lalancette
He was a computer programer for 30 years and was terminated from his job for refusing to get injected.

Dr. Patrick Provost
He was suspended and is currently facing termination from his job as a professor of Biology and Immunology for speaking out against the mandates and the injections.

Sheila Lewis
She was removed from the transplant waiting list for not taking the COVID injection; she could not live without the transplant. In August of 2023, Sheila passed away as a result of her terminal illness.

Kristen Nagle
She is a nurse who lost her job for not complying with the mandated injection. She testified that she was investigated by the College of Nurses and placed on an indefinite suspension.

Jean-Philippe Chabot
Married and father of five children, he was fired from his job at CBC for refusing to get the injection. He could not collect Employment Insurance as CBC coded his termination as misconduct.

Anita Krishna
She worked for 25 years for Global News but was terminated for speaking against the government narrative and mandates.

William Bigger
He has autism and was terminated from his job. He was unable to participate in any of the programs he needed for social support and development.

Laurier Mantil
She was a letter carrier for 7 years and lost her job over refusal to take the COVID injection.

The preceding witnesses described being unilaterally required by their employers to take the COVID-19 injections. The threat against them was that if they did not comply with this unilateral order, they would lose their employment, so they were threatened under loss of employment.

In addition, many of them were denied any assistance from their labour unions and, as a result, were deemed ineligible to take their cases to any further tribunals due to the collective agreements with their unions.
Many of them reported that, at first, they were not immediately fired but were placed on leave without pay or they were suspended indefinitely without pay. This appeared to be a technique used by many employers. When they were finally terminated, their Records of Employment (ROE) were generally coded in a way that they would not be eligible to receive Employment Insurance.

At least one witness testified that his employer, who was a very large power generation company, banned him for life from not only working for that company but also banned any and all contractors who worked for the company from hiring him for life. This effectively ended his career as a nuclear technician.

The environment in many workplaces had become poisoned, and a hateful and bullying atmosphere was allowed to develop, with hate focused on the group of people who refused to comply with the mandates.

Individuals’ private medical status were identified and made known in the workplace, further subjecting those persons to ridicule and hatred.

The political class and the media class were responsible for creating these conditions through their relentless campaign of propaganda and terror.

The damage that these actions inflicted on Canadian society cannot be underestimated. The damage to institutions, families, communities, and the damage to various institutions is profound.

Critical workers who were desperately needed were unceremoniously demonized, ostracized, and then terminated.

The following witnesses described a variety of situations which they experienced or observed during the mandates.

The scope of these testimonials touch every aspect of society in Canada.

**Chief John Grey Burke**
He was a victim of violence (due to his mask exemption because of cancer) at a Canadian Tire store, as a result of terror induced from propaganda.

**Natasha Petite**
She had a medical exemption from wearing a mask and was attacked in a Walmart store. Police arrested her due to terror related to propaganda.

**Marylaine Bélair**
Her husband was run over by an angry customer in the parking lot of a Walmart store. The customer was enraged by mandates. Her husband was rushed to hospital, but she was denied entry to be with him. He was in the hospital for four and a half months until passing away from his injuries. Her children were only allowed to see him once in the four and a half months, and he got very little care.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

**Tobias Tissen**
Mr. Tissen was arrested, fined, and jailed for opening a church.

**Pastor James Coates**
He refused to close his church. He was arrested, fined, and jailed.

**Steven Setka**
His refusal to get a COVID injection caused a split within his family, and when his church brought in vaccine passports, he was refused entry.

**Elizabeth Galvin**
Her daughter committed suicide after her university was locked down, and she was quarantined away from any friends and support groups.

**Brandon Pringle**
He experienced bullying at work, and his family was split over his refusal to get injected. He was not allowed to visit grandchildren for six months due to terror induced in his family.

**Marjaleena Repo**
Wearing a mask presented a serious health risk to her, and so she got a mask exemption. She was diagnosed with terminal cancer, and she wrote a post on Facebook concerning how she was being treated. She got many threatening responses, and a radio station allegedly also attacked her and revealed her personal information. She experienced inhumanity and terror caused by COVID mandates.

**Pastor Steven Flippin**
He watched his congregation deteriorate due to church closings and isolation. He kept his church open to support members, and he was fined.

**Mandy Geml**
She was pregnant through 2020, so she did not get a COVID injection. The schools were shut down due to mandates, and the kids had no activities. Her daughter was bullied by a teacher for not getting the injection. Her mother was in a nursing home and was isolated, and they could not visit her. She commented on how quickly people turned on each other due to terror.

**Heather Burgess**
Her father passed away leaving her mother with dementia in a long-term care home. Her mother was locked down and isolated and was not allowed any visitors. Her mother thought she had been kidnapped; she could not understand the isolation. When her mother was dying, the geriatric nurse kicked them out and would not let them see her. She got vocal when they started injecting kids, and she has been isolated and ridiculed.
**Judy Soroka**  
She was a retired nurse with back injuries and needed therapy and treatment, which she could not get because of the lockdowns. Her condition got worse due to the lack of treatment during the mandates.

**Dianne Molstad**  
She had high blood pressure and she refused to get the injection. Her family doctor of 30 years fired her as a patient as she had not been injected. It took her three days of calling to get a new doctor.

**Angela Tabak**  
Her son had special needs, but prior to the mandates, he was living on his own and working. Due to mandates he lost his job and was isolated at home. He could not get any treatment for his physiological condition and continued to deteriorate, and he spent hours watching news reports. He was found dead from suicide.

**Kim Hunter**  
She has been an early childhood teacher for 20 years. She witnessed the effects that masks were having on the children and did research into the effectiveness of masking. Her workmates isolated her and attacked her for not wearing mask.

**Caroline Hennig**  
Her father’s health deteriorated quickly in a long-term care facility due to isolation and neglect. She removed her father from the home and nursed him back to health. She had to readmit him to care as she left the country; he deteriorated and died under the government’s assisted suicide program (MAID).

**Lynette Tremblay**  
Her mother was in long-term care during the pandemic; the facility was in lockdown despite having no cases of COVID-19. She was denied entry to see her mother, and the police were at the facility blocking people from entering. Patients were allegedly not receiving care during the lockdowns. She took photos as proof of neglect and was barred from the facility.

**Marc-André Paquette**  
He is a kindergarten teacher. He reported significant issues that he was observing with the development of children while subject to mask mandates. He said the politicians had created a campaign of terror to coerce children to comply with mandates and take injections.

**Dr. Keren Epstein-Gilboa**  
She has a PhD in developmental psychology. She stated how children were traumatized due to the propaganda and by the various mask mandates and school shutdowns.
Aidan Coulter
He was a student at Canadian University. He received a letter from the university demanding that he take the injection or he would not be allowed to attend university, so he dropped out.

The testimony of these witnesses describe a society in free fall, where blind violence is used in place of reason and how citizens were attacked or arrested or even killed due to the blind terror that was induced in the population.

People suffering from visible disabilities were attacked and subjected to violence, even an elderly woman with a terminal condition. In the depth of her shock and grief, she was allegedly subjected to mob violence, which was assisted and abetted by a local radio station. These types of attacks are unheard of in Canada.

Witnesses described how their elderly loved ones were subjected to horrific conditions of neglect, isolation, and hate, simply due to the terror induced by propaganda.

People were prevented from seeing or being with their loved ones at the most personal moments of their lives.

Families broke apart and young people took their lives, due to loneliness and isolation.

Expert witnesses testified to the lifelong developmental problems that have been created for our children and that no concrete remedial steps are being taken at present to address these developmental and behavioural effects.

Churches, the traditional centres of our communities, were closed, pastors were vilified, and entire congregations were isolated and prevented from gathering. There was no separation of church and state during the pandemic.

Conclusion
The mandates that were imposed on the citizens of Canada represent the most profound invasion into the private lives of Canadians. No one was spared this assault.

While citizens were subjected to the never-ending narrative that COVID-19 lockdowns were implemented to mitigate the spread of the virus and protect public health, that narrative has now proven to be objectively false.

Many witnesses to this Commission testified that there was no especially deadly or virulent virus that needed to be contended with. The government, at the very least, simply panicked, and they implemented extremely draconian measures which had significant detrimental effects on Canadian citizens.

Some of the damaging effects experienced by individuals during the mandates included
• **Job losses and reduced income:** Lockdown measures resulted in business closures and layoffs, leading to job losses and reduced income for many individuals. This caused financial hardships and increased financial insecurity for households.

• **Small business closures:** The restrictions and closures disproportionately affected small businesses, resulting in permanent closures and the loss of livelihoods for business owners and employees.

• **Financial stress:** Reduced income, uncertainty, and the strain of managing expenses during lockdowns caused financial stress for many individuals and families.

• **Increased stress and anxiety:** The uncertainty and disruption caused by the pandemic measures led to heightened levels of stress and anxiety for individuals. The fear of contracting the virus, financial concerns, social isolation, and other factors have taken a toll on mental wellbeing.

• **Social isolation and loneliness:** Physical distancing measures and restrictions on social gatherings led to increased social isolation and loneliness, which can contribute to mental health issues such as depression and anxiety.

• **Impact on vulnerable populations:** Vulnerable groups, including those with preexisting mental health conditions, seniors, and individuals experiencing domestic violence were particularly affected by the isolation and limited access to support services during lockdowns.

• **Disrupted learning:** School closures and the shift to remote learning disrupted the education of students at all levels. This created challenges in terms of access to resources, effective learning environments, and social interaction, impacting academic progress and wellbeing.

• **Increased educational disparities:** The transition to remote learning exacerbated existing educational disparities, with students from low-income households, those without access to reliable internet or technology, and marginalized communities facing additional challenges in accessing quality education.

• **Delayed medical treatments:** Non-urgent medical procedures and routine check-ups were postponed or delayed due to the strain on healthcare systems during the pandemic. This resulted in delayed diagnoses, potential health complications, and increased healthcare needs in the future.

• **Mental and preventive health impact:** Access to mental health services, preventive screenings, and regular healthcare services were limited during lockdowns. This has impacted the overall health and wellbeing of individuals and could lead to long-term consequences.

• **Disruption of social connections:** Physical distancing measures and restrictions on gatherings disrupted social connections and the ability to engage in community activities, resulting in a loss of support networks and reduced community cohesion.
• **Impact on cultural and recreational activities:** Closure of cultural venues, cancellation of events, and restrictions on recreational activities limited opportunities for entertainment, cultural participation, and personal fulfillment.

People lost their jobs, and families struggled to survive; some people even lost their lives due to alleged vaccine injuries, suicide, or other violence. There was even testimony alleging that a senior was driven into the government’s own assisted suicide scheme and lost their life due to isolation and depression.

The effects of these mandates will be with us for generations.

There are no concerted efforts being undertaken to try to repair the damage done.

Governments are misrepresenting what happened and along with their accomplices in the media, they are reframing the narrative and convincing people that it is over and they should simply move on.

The censorship continues. The lies and the false narrative continue and are further diversifying into other areas without pause.

**Recommendations**

A. **An independent judicial investigation** must be undertaken to determine responsibility and criminality. Any and all institutions, individuals, or organizations that were responsible for breaking of the law need to be brought to justice.

B. **Laws need to be strengthened** to specifically prohibit the mandating of medical procedures and the exposure of private health information. There are current laws in place, but somehow these laws did not protect Canadians.

C. **Canada must affirm its adherence** to international law and human rights and invite an investigation of the actions of the government according to these treaties.

D. **An intensive program** aimed at addressing the developmental damage done to our children must be undertaken and implemented immediately. It is not acceptable to simply move on with business as usual. Children have been emotionally, developmentally, and educationally damaged, and remedial actions are required.

E. **An investigation into the actions of the CBC** and privately held media companies in Canada must be undertaken to determine criminality under the current hate speech and terrorism laws in Canada. It was the relentless stream of hate, propaganda, and terror which was responsible for much of the damage done.

F. **All employees who were terminated** due to refusal to take a medical procedure must be rehired and paid compensation. All costs of these actions need to be paid for by the parties who mandated and implemented the terminations.
G. The regulations concerning the operation of elderly persons’ care homes need to be reformed. Never again should these institutions be allowed to lockdown, isolate, and ignore the needs of the residents and their relatives. Compensation needs to be paid and criminal charges laid as appropriate.

H. A mandatory course on the Canadian Charter of Rights and Freedoms is to be developed and become mandatory for all public service employees, as part of the effort to assure that these actions are never supported again.

I. A high-school level course must be developed to teach the Canadian Charter of Rights and Freedoms and civics to all high school students in Canada. This course must be mandatory nationwide.

J. The history of what happened during the pandemic, including an accounting of who was responsible, must be developed and included as a module in all high school history courses. This history is to be mandatory.

K. Government officials, the judiciary, and regulatory boards did not adequately safeguard the interests of Canadians. It is imperative to implement measures that establish civilian oversight for many of these institutions, ensuring their independence from political influence and interference.

L. Financial Support:
   • Ensure efficient and accessible delivery of financial assistance programs to individuals impacted by the mandates, including those who have lost their jobs or experienced reduced income.
   • Expand income support programs and consider targeted initiatives for vulnerable populations, such as low-income individuals, single parents, and seasonal economy workers.
   • Provide rent and mortgage relief programs to ease the financial burden on individuals facing housing insecurity.

M. Mental Health Support:
   • Increase access to mental health services, including telehealth options, to support individuals experiencing heightened stress, anxiety, and other mental health challenges.
   • Implement public awareness campaigns to reduce stigma associated with seeking mental health support and promote available resources.
   • Invest in community-based mental health programs and initiatives that address the specific needs of diverse populations.
N. Educational Resources and Support:

- Ensure access to remote learning resources and technologies for students to minimize educational disruptions.
- Provide additional support and resources for students from disadvantaged backgrounds to address students experiencing educational disparities and issues related to technology.
- Invest in educational and vocational training programs to support individuals in re-skilling or up-skilling to adapt to changing job market demands.

O. Healthcare Access and Outreach:

- Prioritize and expedite non-urgent medical procedures and screenings that were delayed or cancelled during the mandates to address healthcare needs and prevent further complications.
- Increase outreach efforts to promote preventive healthcare measures such as regular check-ups.
- Enhance access to telehealth services and digital health platforms to facilitate remote consultations and healthcare support.

P. Community Support and Engagement:

- Facilitate virtual community engagement initiatives to foster social connections, combat social isolation, and promote community resilience.
- Provide funding and resources to community organizations and non-profit groups that offer support services, food banks, and other essential resources for those in need.
- Encourage employers to prioritize employee wellbeing by implementing flexible work arrangements, promoting work-life balance, and supporting mental health initiatives.

Q. Communication and Information Dissemination:

- Ensure clear, consistent, and timely communication about public health guidelines, mandates, and available resources to keep citizens informed and reduce confusion.
- Utilize diverse communication channels to reach different segments of the population, including multilingual communication and accessibility measures for individuals with disabilities.
- Combat misinformation and promote evidence-based information through public health campaigns and collaborations with trusted sources.

R. Long-Term Preparedness and Resilience:

- Invest in healthcare infrastructure, including increased hospital capacity and resources, to improve pandemic preparedness and response capabilities.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

- Establish contingency plans and strategies to manage future crises effectively, balancing public health priorities with minimizing social and economic disruptions.

- Foster collaboration between government, businesses, and community stakeholders to develop comprehensive and coordinated approaches for future emergencies.

By implementing these recommendations, the Canadian government and relevant stakeholders can provide support and assistance to citizens impacted by the COVID-19 interventions, helping individuals navigate the challenges, promote wellbeing, and build resilience during and beyond the pandemic.
7.3.3. Financial Impact of the COVID-19 Pandemic Response on Canada

Introduction
The actions of the various levels of government, private organizations, and individuals during the COVID-19 pandemic caused unprecedented disruption to the economy of Canada.

The announcement of the pandemic and subsequent implementation of pharmaceutical and non-pharmaceutical measures resulted in significant economic damage, ranging from widespread job losses to business closures and government debt accumulation.

This section explores the financial impact of the pandemic on Canada, delving into its effects on various sectors of the economy and the measures taken.

According to testimony from Dr. Jordan Peterson, a new disease was detected, which was not well understood, and the authorities panicked and used that panic to impose tyranny. In order to avoid responsibility for their actions, they abdicated their political responsibility to hypothetical experts in public health.

Both political leaders and citizens allowed these non-elected officials to use terror to justify implementation of restrictions. These same officials then unleashed unbridled spending on measures that were actually caused by the restrictions imposed by them. The actions of the government caused “untold economic damage” to all sectors of our economy.

The best way to try to evaluate the damage discussed by Dr. Peterson is to review the data provided by the Treasury Board of Canada to understand the magnitude of spending that was carried out.

Witness David Leis stated that the costs of the mandates were profoundly damaging in all aspects of our society including economics. He further stated that governments did not follow their emergency plans to mitigate these effects.

Evaluation of the totality of the economic effects are well beyond the scope of this report; however, the testimony received did point to a number of specific areas of economic impact and further suggested other significant sources of economic impact which are not yet understood.

Economic Contraction and Unemployment
The pandemic measures led to a sharp contraction of the Canadian economy as restrictions on movement and business operations severely disrupted various sectors. Industries such as hospitality, tourism, retail, and entertainment were hit hardest, resulting in widespread layoffs and business closures.

According to Statistics Canada, the country experienced its steepest economic decline on record in the second quarter of 2020, with a contraction of 11.5 per cent.
The increase in unemployment rates was one of the most significant financial consequences of the pandemic. Many individuals lost their jobs or faced reduced hours, causing financial instability and impacting their ability to meet basic needs. The unemployment rate surged from 5.6 per cent in February 2020 to a peak of 13.7 per cent in May 2020, representing millions of Canadians affected by the economic fallout.

As noted previously, significant taxpayer funds were expended to provide economic support to workers who were forced into an unemployed situation due to the government-imposed mandates.

At the same time, many workers who lost their employment for refusing the mandated injection were refused employment benefits.

**Government Spending and Debt Accumulation**

As a response to the government’s own actions in implementing the mandates and various other unnecessary and ineffective measures, the Canadian government implemented significant fiscal measures.

These measures included direct support to individuals and businesses, wage subsidies, and increased healthcare spending. The Canada Emergency Response Benefit (CERB) provided temporary income support to those who lost their jobs or income due to the pandemic. The Canada Emergency Wage Subsidy (CEWS) aimed to help businesses retain employees.

According to the [Treasury Board of Canada](https://www.treasuryboard.gc.ca), the federal government’s expenditures related to COVID-19 included the following:

2020–2021: $134.9 billion
2021–2022: $ 40.1 billion
2022–2023: $ 60.0 billion (to February 2023 only)
Total: $181.0 billion

To illustrate where this money was spent, a breakdown of the COVID-19 expenditures for 2020-2021 are provided by the Treasury Board as follows:
<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>

</table>
Detailed breakdowns of the expenditures for years 2022 through 2023 are available from the Treasury Board of Canada.

These controversial initiatives led to a substantial increase in government spending and a surge in the national debt. The federal budget deficit for the 2020-2021 fiscal year reached a historic high of over $354 billion. As a result, Canada’s total federal debt surpassed the $1 trillion mark, which will have long-term implications for the country’s fiscal health and future economic policies.

Canada’s Department of Finance reported the following values for the National Debt of Canada:¹²⁹

- **March 31, 2019**: Canada reported a federal national debt of $685.5 billion dollars.
- **March 31, 2020**: Canada reported a federal national debt of $721.4 billion dollars.
- **March 31, 2021**: Canada reported a federal national debt of $1.0487 trillion dollars.
- **March 31, 2022**: Canada reported a federal national debt of $1.1345 trillion dollars.

It must be clearly understood that it is Canadian citizens who are responsible for this debt and that the size of this new debt will have significant impacts on Canadians for generations to come.

Witness Edward Dowd testified concerning the costs related to excess deaths in the United States, and although these deaths are not directly related to the Canadian experience, certain indications can be gleaned from the statistical cost estimates related to excess deaths reported in the 2021 to 2022 period. According to Mr. Dowd, in the United States over the period of 2021 to 2022, there were an estimated 300,000 excess deaths that he attributed to vaccine deaths and deaths due to mandates imposed. The estimated economic cost of these deaths is estimated to be on the order of $150 billion.

Witness Dr. Denis Rancourt’s estimate of these costs for Canada is approximately 10 per cent of these figures, which would equate to around $15 billion in loss.

These estimates do not include the additional losses due to lost productivity.

Dr. Douglas Allen testified that the modelling of deaths utilized by the government to justify their actions was based on false assumptions, and the estimated number of deaths was grossly incorrect. The estimated number of deaths predicted by the government model was approximately 15 times what actually happened.

Additional costs that were not taken into account include

- lost education opportunities,
- increased deaths and reduced life expectancy due to increased unemployment,
- increased deaths due to despair,
- increased domestic violence and family breakdown,
- supply chain disruption costs and consequences, and
- direct deaths caused by lockdowns and vaccines.

Dr. Allen stated:

> Lockdowns are not just an inefficient policy, they must rank as one of the greatest peacetime policy disasters of all time.

**Stock Market Volatility and Investment Implications**

The stock market experienced significant volatility during the pandemic, with widespread fluctuations in values across various sectors. While some companies thrived due to increased demand for certain products and services (for example, technology and e-commerce), others faced steep declines. Investors faced heightened uncertainty and risk, impacting retirement savings, investment portfolios, and overall financial stability.

The pandemic’s financial impact also highlighted the need for diversification and resilience in investment strategies. It underscored the importance of considering factors such as industry resilience, sustainability, and adaptability when making investment decisions. The volatile market conditions prompted many individuals to reassess their financial goals and seek professional advice to navigate the uncertainty.

Some investors removed their capital from the market altogether fearing account lockouts or wholesale market devaluation.

Dr. Douglas Allen testified that there was an $80 billion drop in the stock market in Canada between March and April 2020 as a result of the government’s actions.

**Conclusion**

The government response to the COVID-19 pandemic had far-reaching financial consequences for Canada, impacting various sectors of the economy and affecting the lives of individuals and
businesses across the country. The economic contraction, increased unemployment, government spending, and growing debt levels created significant challenges. Small businesses have struggled to survive, and investors have faced heightened volatility and uncertainty in the financial markets.

Addressing these financial impacts requires a multifaceted approach that involves continued government support, fiscal prudence, and a focus on economic recovery and resilience.

Balancing public health measures with targeted support for affected industries and individuals is crucial for mitigating the long-term effects of the pandemic on Canada’s financial wellbeing. By learning from this crisis and implementing strategic policies, Canada can emerge stronger and more resilient in the post-pandemic era.

Recommendations

A. **Restraints must be placed on public health officers.** They must be required to immediately justify their recommendations with legitimate cost–benefit analyses, and their decisions must be subject to the authority of publicly elected officials and the transparent scrutiny of the public.

B. **All scientific studies on either side** of a crisis must be made available to the public so that the effect of propaganda can be minimized.

C. **Public health officials should never be placed in charge** of an Emergency Response. Emergency Response must remain the purview of professionals trained in medical and emergency procedures who understand how to set goals and achieve them.

D. **Lockdowns and mandates** must require direct legislative authority. These steps cannot be allowed to be carried out under regulations.

E. **The media must be held to account** for their collusion in the propaganda that caused the panic among citizens and authorities.

F. **A detailed financial audit must be undertaken** on each and every dollar that was spent on the pandemic. It must be determined whether any mishandling of these funds occurred.

G. **Identify and prioritize essential expenditures** directly related to public health and safety, such as healthcare infrastructure and support for vulnerable populations.

H. **Evaluate the effectiveness and efficiency** of existing programs and initiatives to ensure resources are allocated wisely, redirecting funds from less effective areas to more impactful measures.

I. **Focus financial support** on the most affected sectors and individuals, such as small businesses, low-income households, and those facing unemployment or reduced income due to the mandates.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

J. **Streamline administrative processes** to reduce red tape, bureaucratic delays, and associated costs, ensuring funds are disbursed promptly to those in need.

K. **Enhance transparency and accountability** in spending by providing regular public reporting on the allocation and utilization of funds, enabling citizens to monitor government expenditures.

L. **Invest in long-term emergency planning** and preparedness measures to mitigate the impact of future pandemics or health emergencies. This may include strengthening public health infrastructure, establishing emergency funds, and enhancing the capacity for rapid response and data collection.

M. **Ensure that future public health emergencies** are operated by the existing Emergency Management Apparatus and that the public health authorities provide input into that apparatus but are not able to lead or control it.

N. **Response to future public emergencies** must be driven by and directed by local emergency planning personnel on the ground and not driven by federal government political processes.

O. **Consider the potential cost-saving benefits** of investing in preventive healthcare measures, public health education, and research and development in the healthcare sector.

P. **Continuously monitor the effectiveness and impact** of government spending on COVID-19 mandates and measures, adjusting allocations as needed based on evolving circumstances, scientific evidence, and changing priorities.

Q. **Engage in rigorous and public evaluation** and assessment of programs and policies to identify areas of inefficiency or ineffectiveness, making data-driven decisions to optimize resource utilization.

R. **Focus on measures that stimulate economic recovery** and job creation, such as infrastructure investments, targeted incentives for business growth and innovation, and initiatives to promote consumer spending and tourism.

S. **Balance short-term relief measures** with long-term economic strategies to foster sustainable growth and resilience in the post-pandemic era.

T. **Canada must adopt a Canada First policy** where our national interest drives overall policy agendas. This applies to all aspects of our nation, including fiscal, financial, social and environmental policy. Global planning and response with a lack of Canadian input created the situation that we now find ourselves in.

U. **Canada is a country** whose economy is dependant on natural resource extraction and production. Canada must implement policies to upgrade and expand these core economic drivers so that export income can be quickly injected into the Canadian economy, addressing these historic debts caused by the government’s actions during the pandemic.
V. **Some of the damage and hardships** experienced by Canadians was caused by an acute lack of independence and diversity of critical aspects of our economy. Canada must rigorously review and apply the anti-combines laws (*Competition Act*) to limit Canadians exposure to undue influence from the many monopolies that currently exist across critical sectors of our economy.

By implementing these recommendations, governments can exercise restraint in spending while ensuring that essential needs are addressed, support is provided to those most affected, and long-term preparedness measures are in place. It is crucial to strike a balance between fiscal responsibility and the necessary investments to protect public health, support the economy, and promote the overall wellbeing of citizens.
7.4. Media Actions During the Pandemic

Introduction

A free and robust democratic society is uniquely and inextricably dependant on the free exchange of accurate and reliable information that is without bias and without government or corporate influence.

It is absolutely imperative that a media source declare any known or perceived biases which it may have to the public so that the public can clearly make a distinction between facts and opinion.

The Canadian public depended on the media providing fair and accurate information to allow them to properly assess the situation as it unfolded and to allow the public to make critical decisions both for themselves and their families.

This report utilizes the following definitions:

* Media* is defined as:
  
  The main means of mass communication (broadcasting, publishing, and the Internet) referred to collectively as the media. Examples include cable and over-air television and radio, internet services, as well as print media such as magazines and newspapers.

* Traditional media* is defined as:
  
  Print media and broadcast media comprised of state and corporate media companies, encompassing television, radio, magazines, newspapers, and internet content as produced solely by those state and corporate entities.

* Internet service provider* is defined as:
  
  Internet services which include simple access provision to the supply of media companies which provide a “public discussion” platform.

Freedom of Expression and Freedom of the Press

The concepts of freedom of expression and freedom of the press are so important to the development of and maintenance of a democratic society that these freedoms are clearly set out in the foundational documents of Canada. For example, Section 2 of the *Canadian Charter of Rights and Freedoms* as expressed and codified in the Constitution Act, 1982.

Within the *Constitution Act, 1982* under Fundamental Freedoms, item 2 states the following:

2. Everyone has the following fundamental freedoms:

   (a) freedom of conscience and religion;
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

(b) freedom of thought, belief, opinion and expression, including freedom of the press and other media of communication;

(c) freedom of peaceful assembly; and

(d) freedom of association.

Item (b) specifically indicates that there is to be “freedom of the press and other media of communication.”

Freedom does not simply refer to the censorship of various forms of media or communication, it also encompasses the absence of interference or influence from the state. A free press is in direct opposition to a paid press which is expressly concerned with and exists to espouse the opinions and positions of those entities that are paying it.

The freedom of the press and media extends to all areas of communication (written or spoken) and in the instance of this investigation must include the freedom of scientific research and publication.

Consumers in Canada are generally protected from unscrupulous or misleading advertising and information. There are generally provisions to protect consumers from “Conduct Against Consumers,” which is to protect the public from misleading and deceptive conduct and unconscionable conduct, et cetera.

So the question becomes exactly what type of media coverage did Canadians receive from their traditional media outlets over the course of the pandemic?

Did the traditional media examine with a critical eye everything that the government was telling Canadians, or did they simply echo what was being provided to them from government sources?

Did the traditional media support freedom within their own newsrooms? Did they permit investigative reporters to examine the claims being made by the government and prepare news stories that were presented to the public?

Did the traditional media carefully interview all sides of the issues, and did they take extra care to protect people who presented alternative views to that government narrative?

Has the traditional media done anything in the current situation to address any of their real or perceived shortcomings during the pandemic?

Testimony Concerning Media Actions During Pandemic

Significant testimony was provided to the Commission which clearly demonstrated that freedom of the press and other media no longer exists in Canada, on all levels involving the traditional media sources in Canada.

Based on the testimonies received, the traditional and online corporate media did not act independent of government and corporate influence.
The dissemination of critical and accurate information concerning the facts related to the pandemic itself, effective measures to treat COVID-19, government-imposed mitigative measures, and the safety and effectiveness of vaccines were almost entirely based on government and industry or government- and industry-influenced or sponsored sources.

Active measures were taken by traditional and online media sources to suppress, censor, and ridicule opposing opinions related to the pandemic.

The recommendations and mandates were in a constant state of change, and the investigative press took no steps to actively investigate or evaluate the validity of those measures and made no attempts to inform the Canadian people of the realities of the measure being mandated.

Without accurate and complete information, the Canadian people could not make critical decisions on medical matters that deeply affected every aspect of Canadian Society. Furthermore, without clear and accurate information, the public were never put into a situation where they could provide “Informed Consent” prior to accepting any proposed medical treatment that was being foisted on them by the government, medical community, and even their employers and religious leaders.

Many Canadians were left at the mercy of what turned out to be an unrelenting cascade of false, misleading, and incomplete information as provided by various government agencies.

Many Canadians were not aware, due to exclusionary reporting and outright censorship, of the experimental and untested nature of the COVID-19 vaccines.

Many Canadians were not aware of the significant planning that had taken place prior to the pandemic and how the mandates and directives of the government during the pandemic were in conflict with the recommendations of the official emergency pandemic plans.

Critical definitions of terms were revised and facts were blurred in order to coerce Canadians into accepting the government/industry narrative.

Long understood and trusted terms were used to provide a false sense of confidence for Canadians. Examples include:

- pandemic,
- vaccine,
- biologic,
- Spike Protein Disease,
- ambassador,
- safe and effective,
- relative efficacy, and
- absolute efficacy.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Traditional media providers and their news broadcasts in Canada are no longer independent of the government and special industry interests as they are either directly funded by government and large industry groups or receive very significant funding through advertising from these organizations.

Due to the Canadian government’s lack of enforcement of the Competition Act, traditional media companies in Canada have been allowed to conglomerate to the extent that little or no independent companies now exist. Most news and media outlets are owned and controlled by a very small cadre of large corporations. This reduces Canadians’ choice of independent media outlets to near zero.

According to testimony received, the CBC alone receives more than one billion dollars in direct government funding; it is not known how much additional funding they receive from government advertising or pharmaceutical industry advertisements.

Other traditional media sources in Canada received hundreds of millions of dollars of direct government funding over the course of the pandemic period. It is interesting to note that this funding was not provided to all media firms, only specific media firms, especially traditional media sources.

In addition, the days of an independent media in Canada and in most of the Western world are long gone. The days of the independent newsroom or the news outlet that are not owned and controlled by huge multinational interests have passed.

Most traditional news sources in Canada are no longer independent, and they no longer permit independent and unbiased journalism to take place within their organizations. Reporters are often specifically directed as to what stories they can and cannot cover, based on a corporate directive.

As demonstrated from the Twitter Files release in the United States, government agencies were working hand in hand with large media firms such as Twitter, Youtube, and Facebook to directly censor and/or limit the exposure of opinions and facts that did not support the approved government narrative.

The NCI heard very specific testimonies from the following witnesses:

**Rodney Palmer**
A veteran journalist, Rodney Palmer presented on the difference between news gathering and propaganda, exposing how CBC shifted away from news gathering to promoting propaganda and fomenting hate.
(Toronto: March 30, 2023)

In his second testimony with the NCI, Rodney Palmer reported on the bias at CBC in terms of their funding and manipulation of the news.
(Ottawa: May 18, 2023)
In a taped announcement for the NCI, Rodney Palmer described CBC’s new Twitter label. (April 18, 2023)

**Anita Krishna**  
She described her behind-the-scenes journey as a former Global TV director.  
(Ottawa: May 18, 2023)

**Jean-Philippe Chabot**  
A former CBC employee, he described how he navigated his vaccine status disclosure.  
(Ottawa: May 18, 2023)

**Marianne Klowak**  
A former veteran CBC journalist, she testified on the decline of journalism at the CBC during the pandemic.  
(Ottawa: May 18, 2023)

**Jeff Sandes**  
He reported on the changing landscape of journalism.  
(Vancouver: May 3, 2023)

**Jeffery Tucker**  
He described the loss of trust in mainstream media during COVID-19.  
(Winnipeg: April 14, 2023)

**Dr. Robert Malone**  
He testified on COVID-19 injections and 5th-generation warfare against humanity.  
(Toronto: March 30, 2023)

**Cathy Jones**  
She described how the media was complicit in the pandemic narrative.  
(Ottawa: May 17, 2023)

**James Corbett**  
An independent journalist, he discussed the international health emergency treaties.  
(Ottawa: May 18, 2023)

The testimony of witnesses allege that the media sources in Canada, which should in a democratic society inform Canadians, did not perform their duties in a non-biased and fair manner.

Witness statements describe a corrupt and biased system of reporting that only presented the government and corporate narrative while omitting any reasonable and balanced dissenting information regardless of the source and the credentials of those sources.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Many witnesses described being targeted by media for ridicule and, in some instances, with violence.

Widely cited is the August 26, 2021, front page of Canada’s largest newspaper the Toronto Star.

In addition, media carried an interview from September 8, 2021, with Mr. Justin Trudeau who stated the following:

Yes, there is a small, fringe element in this country that is angry, that doesn’t believe in science, that is lashing out with racist, misogynistic attacks, but Canadians, the vast majority of Canadians, are not represented by them, Trudeau said.

These are simply a few of hundreds of statements and headlines that targeted Canadians with hate and made them potential targets for violence.

Few if any dissenting articles were provided in the traditional media to rebut these statements or offer an unbiased review of these statements.

In fact, many statements were carried in the traditional media that were factually incorrect and to this date, many of these media outlets have not retracted or condemned the comments made.

People who had legitimate opinions that were contrary to the government narratives were savagely vilified in the traditional media. People were called “anti-vaxxers,” “haters,” “misogynists,” “racists,” and “extremists.”

Witnesses testified that the news was being directed from central corporate headquarters and that reporting or investigation of any opinions which were contrary to the government narrative were not to be pursued.

According to the testimony of Mr. Rodney Palmer, the news organizations contained within the traditional media morphed into propaganda organizations rather than news-gathering organizations.

Mr. Palmer included the following Oxford definition of news gathering:
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

... the process of doing research on news items, especially ones that will be broadcast on television or printed in a newspaper.

He defined propaganda as

Persuasive mass communication that filters and frames the issues of the day in a way that strongly favours particular interests, usually those of a government or corporations. Also, the intentional manipulation of public opinion through lies, half-truths, and the selective retelling of history.

According to Mr. Palmer, the CBC were putting forth as “experts” organizations such as First Draft, who provided propaganda information in place of actual news sources. The information provided by First Draft was in contradiction of other newspaper sources, such as articles in The Washington Post from April of 2020.

There were numerous reports in 2020 from publications such as Vanity Fair, which presented credible evidence contrary to reports by the CBC.

Mr. Palmer provided an article from the BBC from 2023, which directly contradicted the CBC reporting, and yet no retraction or further follow up from the CBC has been provided.

Mr. Palmer cited internal correspondence from CBC concerning pandemic misinformation only weeks into the pandemic, a time when it would not have been possible to discern what was true or false information.

There are a number of industry groups that many of the traditional media in Canada are a part of that seem to be focusing on what they deem as “trust” issues, which Mr. Palmer asserted explains some of the monolithic reporting by many of these organizations.

According to Mr. Palmer, CBC took steps to report over 800 pieces of information found on social media that Internet service providers censored.. It is difficult to understand how the CBC took on the role of censor.

Reporting was skewed toward developing public hate of people who were not in agreement with the government narrative, yet the CBC did not carry out an independent investigation of the information to confirm the truthfulness of the government narrative.

Qualifying language was used to promote the government narrative.
CBC also used articles to suppress alternative drug treatments for COVID-19. Mr. Palmer cited a CBC Radio News article from September 2, 2021.

Anita Krishna testified about the extent of the “hysteria” that was being promoted in the newsroom, right from the very start of the pandemic, prior to them having any real information available. She further stated that their newscasts were leaving out significant areas of information. In her opinion, the news was misleading, and she brought this opinion to management who disregarded her concerns and chastised her for bringing up alternative information.

Anita Krishna also spoke about how the new stories had been slanted to promote certain government narratives, and she had never before seen this level of propaganda and censorship within the newsroom.

Testimony from Marianne Klowak indicated that over her 34-year career at the CBC, she was always allowed to pursue stories without much restriction and that approval was always provided on the local level. During the pandemic, journalists were restricted as to what stories they could investigate and report upon as they related to the pandemic.

Ms. Klowak indicated that many of her stories were blocked and never made it to air; these included reporting on protests, reported COVID-19 vaccine injuries, safety concerns, and other pandemic-related issues.

**Conclusions**

Traditional media sources in Canada did not provide Canadians with fair and balanced news reporting during the pandemic.

According to witness David Leis, over 2,000 media outlets in Canada received federal government funding, and therefore, they are under great pressure to support the narrative being promoted by the government.

The government would not have been able to institute the unprecedented actions during the pandemic had it not been for the collusion between the traditional media and the government.

Traditional media sources promoted propaganda stories, promoted hate, targeted certain Canadians, and provided hateful and dangerous rhetoric.

Hateful and terrifying propaganda promoted terror in Canadians and prompted various people, organizations, and agencies to take steps based on that terror, instead of on science.

From the early stages of the pandemic until the current time, the traditional media has not yet taken any significant steps to correct the record for Canadians.

According to the Government of Canada, following is the definition of terrorism:
In Canada, section 83.01 of the Criminal Code[1] defines terrorism as an act committed “in whole or in part for a political, religious, or ideological purpose, objective or cause” with the intention of intimidating the public “...with regard to its security, including its economic security, or compelling a person, a government or a domestic or an international organization to do or to refrain from doing any act.” Activities recognized as criminal within this context include death and bodily harm with the use of violence; endangering a person’s life; risks posed to the health and safety of the public; significant property damage; and interference or disruption of essential services, facilities or systems.

Given that the actions of the media caused terror and panic within all sectors of Canadian society and that this terror was the result of a political narrative handed down by the Government of Canada, consideration must be given to evaluate the detailed chain of decisions made, to determine if an act of terrorism was, in fact, carried out.

Recommendations

**Canadian Broadcasting Corporation (CBC)**

CBC as an organization must be held to account for their very damaging and dangerous actions. Significant steps must be taken to prevent this from ever happening again.

CBC was originally founded on November 2, 1936. Many of the principles under which the CBC was created and justified, no longer exist. With the advent of the Internet and the incredible reduction in the cost of creating quality content, the CBC no longer has a significant role to play in the promotion of Canadian content or the provision of media services to the rural and remote areas of Canada.

A. **The CBC should be stripped** to its very fundamental functions of providing information to Canadians with a special focus on French language and Indigenous issues. All other current functions and productions of the CBC must be terminated immediately.

B. **All current senior management positions** in the CBC must be removed in light of the revised operational mandate.

C. **Dismiss all on air staff that participated** in the dissemination of propaganda during the pandemic.

D. **Replace the CBC Ombudsmen** with a Board of Canadians chosen from across Canada, with two representatives chosen from each province and territory.

E. **The first task of the Board is to investigate** the origins and relationships with the government and industry that influenced the actions of the CBC during the pandemic.

F. **Remove the CBC from the “Trusted News Initiative”** and all other related organizations.
G. **One of the original functions of the CBC** was to support Canadian content, and as such they should return to that role but not to the role as imagined in 1932; it must realize the reality of the 21st century. As such, the CBC mandate would be to help Canadians to develop Canadian content. We propose the following:

a. CBC facilities and equipment, et cetera, might be made available as a resource to private media developers.

b. Utilize expertise that is currently embedded in the CBC to educate and provide training to private Canadian content producers.

c. CBC should use its resources to promote real Canadian content produced by Canadians, not the CBC.

H. **A criminal investigation** must be undertaken to determine what areas of criminal hate speech law may have been violated based on the reporting of the CBC.

**Other Traditional “Privately Owned” Media**

Other traditional media outlets were as culpable as the CBC, but as private industry players, they do have the right to broadcast in accordance with the *Canadian Charter of Rights and Freedoms*. It would be extremely difficult to monitor their content on an ongoing basis, and it should not be the role of the government to regulate that content beyond required by current law.

A. **However, any and all direct government support** to these media entities must be stopped immediately. There is no reason for Canadian taxpayers to be supporting these entities. They are privately owned and as such must survive in the free marketplace as every other private business must.

B. **There is an uneasy monopolization** of traditional media that has occurred in Canada over the past 30 years. A complete investigation of the traditional media sources must be carried out under all federal legislation that deals with the development of monopolies in Canada.

C. **A criminal investigation must be undertaken** to determine what areas of criminal hate speech law may have been violated based on the reporting of the traditional media venues.

D. **Internet social media platforms** must not be censoring or editorializing content on their sites, unless the content is in contravention of the *Criminal Code*.

E. **The Broadcasting Act must be rewritten** to accurately reflect the broadcasting environment of the 21st century. The *Broadcasting Act* should not be used as a tool of the government to censor content or to advance the promotion and production of Canadian content. The act must endeavour to accurately set out the rules and regulations and remove interpretation or development of regulations by an unelected body such as the CRTC.
F. **The role of the CRTC must be reviewed**, and the CRTC possibly abolished if it is determined that the actual role of the CRTC is to simply develop regulations which are not specifically contained in legislation.

G. **Bolster press freedom** and other media communications protections by enacting comprehensive legislation and constitutional provisions in alignment with the *Canadian Charter of Rights and Freedoms*, which ensures and upholds the rights of free expression, access to information, and editorial independence.

H. **Safeguard journalists** from intimidation, harassment, and threats to their personal safety through effective law enforcement and judicial mechanisms.

I. **Ensure that public broadcasting organizations**, such as the Canadian Broadcasting Corporation, operate independently and are insulated from political interference with editorial decisions made by experienced journalists.

J. **Promote a diverse and inclusive media landscape** that reflects a wide range of perspectives and avoids undue concentration of ownership or control.

K. **Increase transparency** in the allocation and utilization of public funds provided to the public broadcaster. This includes clearly disclosing the criteria and decision-making processes for funding distribution.

L. **Establish independent bodies or committees** to oversee and evaluate the disbursement of public funds, ensuring accountability and preventing undue influence.

M. **Foster the development** of non-profit and community-based media organizations to diversify the media landscape and provide alternative sources of information and perspectives.

N. **Establish grant programs or tax incentives** to support the sustainability and growth of non-profit media outlets, enabling them to operate independently of government influence.

O. **Promote media literacy education initiatives** that equip citizens with critical thinking skills to evaluate media sources, distinguish between fact and opinion, and understand the importance of independent journalism.

P. **Promote adherence to professional journalistic standards and ethics**, including accuracy, fairness, and accountability.

Q. **Support self-regulatory bodies**, such as the Canadian Association of Journalists (CAJ).

R. **Enforce ethical guidelines** and provide recourse for individuals who believe they have been misrepresented or harmed by media coverage.

S. **Engage in international forums** and collaborations to advocate for press freedom and protect independent journalism globally.
T. **Support initiatives and organizations** that promote freedom of the press and other forms of media and provide assistance to journalists facing threats or persecution.

U. **Encourage citizen participation** and engagement in media governance, including public consultations, forums, and advisory panels, to ensure diverse perspectives and community interests are taken into account.

By implementing these recommendations, Canada can foster a media landscape that is independent, diverse, and accountable, serving as a cornerstone of democracy and providing citizens with reliable, unbiased information. It is crucial to uphold the principles of press freedom and support traditional media outlets in their role as watchdogs and providers of independent journalism.
7.5. Health

Introduction
This section of the report is based on the testimony of more than 60 expert witnesses and dozens of citizens who have struggled with many health issues caused by health measures ranging from lockdowns, mask mandates, and vaccine mandates.

Emerging, from an overall assessment of the bulk of the testimonies, is a trend describing the evolution of most of the witnesses, at varying pace, of their respective understanding of this very complex and confusing COVID-19 pandemic health crisis. Whether it was expert witnesses or regular citizens, many were unaware of what was unfolding gradually, then suddenly, they came to appreciate that something odd was going on.

These informed individuals are still a fringe, yet there is a rapidly growing minority that are relentlessly sharing their understanding of the bizarre health crisis that we experienced.

Because of their habitual trust in the institutions, very few had detected the actual situation earlier on: the absurdity of the proposed non-pharmaceutical interventions (NPIs) along with the suppression of early treatment on baseless grounds.

Consensus grew with hundreds of thousands of people acknowledging in hindsight the absurdity of the pandemic management. Measures enacted by the government had massive collateral damage and hardly any demonstrated benefits. These measures were supported and presented to the public by a very powerful propaganda campaign. However, to this day, the majority of the population still believe that the NPIs were effective and vaccination was the only way out of the pandemic.

Disseminating the truth to the public will be a challenging endeavour. Unless individuals are willing to question the fundamental objectives of what the pandemic truly entailed and the reasoning behind altering established pandemic management plans to embark on an unprecedented and massive social engineering experiment, they will struggle to recognize the disastrous outcomes resulting from the mishandling of this crisis. Only by addressing these issues can we initiate the essential process of rectification.

List of Witnesses
In preparing this commentary, the authors relied on the following list of witnesses:

Lt. Col. David Redman
An expert on emergency preparedness, he testified on Canada’s deviation from strategic pandemic response.
(Red Deer: April 27, 2023)
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

**Dean Beaudry**
He spoke about risk management and COVID-19 policies.
(Red Deer: April 26, 2023)

**David Leis**
An expert on public policy, he gave testimony on public policy during the pandemic.
(Winnipeg: April 15, 2023)

**Dr. Natalie Björklund-Gordon**
An expert in epidemiology and genetics, she revealed flaws in the COVID response.
(Winnipeg: April 14, 2023)

**Michel Chossudovsky**
An economics professor and director of the Centre for Research on Globalization, he reviewed the social and economic global collapse.
(Québec City: May 13, 2023)

**James Corbett**
An investigative reporter, he unveiled the global pandemic treaty and WHO’s expanding authority.
(Ottawa: May 18, 2023)

**Dr. Jérôme Sainton**
A medical doctor, he analyzed the risk-benefit of vaccines.
(Québec City: May 13, 2023)

**Christian Leray**
A media specialist, he denounced the lack of transparency during COVID-19 pandemic.
(Québec City: May 11, 2023)

**Dr. Jeff Wilson**
A PhD in public health, he discussed the proper outbreak response.
(Ottawa: May 19, 2023)

**Louise MacDonald**
She broke down the misleading government data on vaccine statistics.
(Ottawa: May 17, 2023)

**Dr. Stephen Malthouse**
He gave a physician’s perspective to challenging COVID policies.
(Ottawa: May 17, 2023)

**Dr. Robert Malone**
An expert in mRNA technology, he spoke about 5th-generation warfare.
(Toronto: March 30, 2023)
Dr. Steven Pelech
He discussed the science behind viruses and mRNA vaccines.
(Vancouver: May 3, 2023)

William Munroe
A population analyst, he provided insight into COVID death statistics.
(Vancouver: May 2, 2023)

Dr. Jonathan J. Couey
A neurobiologist, he gave a presentation on coronavirus, PCR testing, and pathogenesis.
(Red Deer: April 28, 2023)

Dr. Keren Epstein-Gilboa
An expert in developmental psychology, she gave a presentation on the impacts of the COVID measures on children.
(Ottawa: May 18, 2023)

Prof. Douglas Allen
An economics professor, he analyzed lockdown measures from a risk-benefit perspective.
(Vancouver: May 4, 2023)

Dr. Greg Passey
An expert in post-traumatic stress disorder, he spoke about narrative shaping and psychological damage from lockdowns.
(Vancouver: May 3, 2023)

Dr. Matthew Cockle
He discussed the conflicts of interest in global health research funding organizations.
(Vancouver: May 2, 2023)

Joseph Bourgault
He spoke on concerning CO$_2$ levels in paper masks.
(Saskatoon: April 20, 2023)

Irvin Studin
He spoke on the impact of school closures on children’s education.
(Toronto: April 1, 2023)

Lynette Tremblay
She shared her heart-wrenching experience during lockdowns.
(Québec City: April 12, 2023)
**Navid Sadikali**
An expert in medical imaging, he explored pandemic rationale and the limitations of COVID injections.
(Ottawa: May 19, 2023)

**Dr. David Speicher**
He highlighted issues with PCR testing and COVID data.
(Ottawa: May 18, 2023)

**Madison Peake**
She gave a personal account of the lockdowns’ psychological toll.
(Ottawa: Day May 17, 2023)

**Kim Hunter**
She discussed the detrimental effects of masking on children.
(Vancouver: May 3, 2023)

**Ryan Orydzuk**
He discussed occupational health and safety considerations.
(Saskatoon: April 21, 2023)

**James Lunney**
He explored the vital role of vitamin D for optimum health.
(Ottawa: May 19, 2023)

**Dr. Francis Christian**
He testified on the censorship of physicians, such as he and Dr. Paul Marik.
(Saskatoon: April 20, 2023)

**Alan Cassels**
He spoke about the UBC therapeutics initiative and provided a critical pharmaceutical analysis.
(Vancouver: May 2, 2023)

**Bryan Baraniski**
He spoke about alternative medication.
(Saskatoon: April 20, 2023)

**Charles Hooper**
He discussed the facts and fiction of ivermectin.
(Winnipeg: April 14, 2023)

**Dr. Barry Bregar**
He discussed the unnecessary fear, suppressed treatments, and vaccine dangers.
(Québec City: May 12, 2023)
Dr. Daniel Nagase
He discussed the unjust treatment of patients and doctors during COVID.
(Ottawa May 19, 2023)

Melanie Alexander
She shared the story of her husband’s medical mistreatment during COVID.
(Ottawa: May 19, 2023)

Dr. Edward Leyton
He spoke of the influence of medical regulatory boards and ivermectin therapy.
(Ottawa: May 18, 2023)

Dr. Peter McCullough
He discussed a study into the autopsy results of vaccine injury deaths.
(NCI Virtual Testimony: July 19, 2023)

Dr. Justin Chin
He unveiled the truth regarding adverse reactions and the vaccine rollout.
(Red Deer: April 27, 2023)

Prof. Denis Rancourt
He presented findings on all-cause excess deaths in Canada during the pandemic.
(NCI Virtual Testimony: June 28, 2023)

Prof. Patrick Provost
An infectious disease specialist, he spoke about concerns with mRNA technology.
(Québec City: May 13, 2023)

Prof. Christian Linard
He discussed concerns about the potential risks and adverse effects of the mRNA vaccine, including its long-term impact on human health.
(Québec City: May 11, 2023)

Vincent Cantin
He testified about his severe vaccine injury.
(Québec City: May 13, 2023)

Dr. René Lavigueur
A family doctor, he shared his expert perspective on COVID-19 vaccine side effects.
(Québec City: May 12, 2023)

Dr. Sabine Hazan
A microbiome expert, she testified about effective therapies for COVID-19.
(Québec City: May 12, 2023)
Évelyne Therrien
She testified about her severe vaccine injury.
(Québec City: May 12, 2023)

Christine Cotton
She revealed flaws in Pfizer’s clinical trials.
(Québec City: May 12, 2023)

Dr. Hélène Banoun
She discussed mRNA vaccines and their side effects.
(Québec City: May 12, 2023)

Carole Avoine
She testified about her severe vaccine injury.
(Québec City: May 12, 2023)

Colleen Brandse
She testified about her severe vaccine injury.
(Toronto: April 1, 2023)

Prof. Denis Rancourt
He presented findings regarding excess deaths during COVID pandemic.
(Québec City: May 11, 2023)

Caroline Foucault
She testified about her severe vaccine injury.
(Québec City: May 11, 2023)

Josée Belleville
She was a victim of vaccination obligations and discrimination in the army.
(Québec City: May 11, 2023)

Prof. Christian Perronne
He spoke on attacks, WHO infiltration, and the dangers of the COVID-19 injection.
(Québec City: May 11, 2023)

Prof. Jean-Marc Sabatier
He testified about the COVID virus and vaccine triggers.
(Québec City: May 11, 2023)

Pierre Chaillot
He testified on the misuse of statistics during COVID-19.
(Québec City: May 11, 2023)
Prof. Didier Raoult
He testified on the evolution of the COVID virus, treatments, and the vaccine.
(Québec City: May 11, 2023)

Mélissa Sansfaçon
She testified about her severe vaccine injury.
(Québec City: May 11, 2023)

Scarlett Martyn
A paramedic, she spoke about the impact of vaccine mandates.
(Toronto: April 1, 2023)

Kimberly Warren
She testified about her vaccine injury and severe kidney problems.
(Ottawa: May 19, 2023)

Aidan Coulter
He testified about his personal experiences as an unvaccinated student.
(Ottawa: May 19, 2023)

Pascal Najadi
He discussed the global implications regarding Swiss authorities and the enforcement of COVID vaccines.
(Ottawa: May 19, 2023)

Dr. Chris Shoemaker
He unveiled the risks and dangers of the COVID-19 vaccine.
(Ottawa: May 19, 2023)

Maurice Gatien
He provided historical context for what’s happening and his work defending the vaccine injured.
(Ottawa: May 18, 2023)

Laurier Mantil
A letter carrier, she discussed balancing pregnancy and safety.
(Ottawa: May 18, 2023)

Capt. Scott Routly
He gave a pilot’s perspective on navigating vaccine mandates.
(Ottawa: May 18, 2023)

Jean-Philippe Chabot
A former CBC employee, he gave insights into navigating his vaccine status disclosure.
(Ottawa: May 18, 2023)
Samantha Monaghan  
She testified on the tragic loss of her son after a blood transfusion.  
(Ottawa: May 18, 2023)

M Tisir Otahbachi  
He shared his story of vaccine injury and what followed in the healthcare system.  
(Ottawa: May 17, 2023)

Mallory Flank  
A former paramedic, she shared her devastating vaccine injury story.  
(Ottawa: May 17, 2023)

Sheila Lewis  
She gave her heartbreaking story of her life-saving transplant being withdrawn.  
(Ottawa: May 17, 2023)

Camille Mitchell  
A pharmacist, she testified on vaccine mandates in healthcare.  
(Vancouver: May 4, 2023)

Shawn Muldoon  
He testified about his severe vaccine injury.  
(Vancouver: May 4, 2023)

Paul Hollyoak  
A coast guard rescue specialist, he testified about his severe vaccine injury.  
(Vancouver: May 4, 2023)

Wayne Llewellyn  
He testified about his struggles against vaccine mandates.  
(Vancouver: May 4, 2023)

Zoran Boskovic  
He shared his experience of losing his job due to vaccine mandates.  
(Vancouver: May 4, 2023)

Ted Kuntz  
He testified on Canada’s lack of safety, efficacy, and Informed Consent for childhood vaccines.  
(Vancouver: May 4, 2023)

Kristen Ditzel  
She testified about her severe vaccine injury.  
(Vancouver: May 4, 2023)
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

**Patricia Leidl**  
She testified about her severe vaccine injury.  
(Vancouver: May 4, 2023)

**Dr. Ben Sutherland**  
He discussed the consequences of vaccine mandates.  
(Vancouver: May 3, 2023)

**Lisa Bernard**  
She testified on vaccine injury and the impact of lockdowns on patient care and mental health.  
(Vancouver: May 3, 2023)

**Dr. Charles Hoffe**  
He testified on natural immunity and COVID vaccine health issues.  
(Vancouver: May 3, 2023)

**James Jones**  
He spoke about the tragic consequences of the vaccine mandates and workplace bullying.  
(Vancouver: May 3, 2023)

**Edward Dowd**  
He discussed the alarming data behind increased death and disabilities.  
(Vancouver: May 3, 2023)

**Dr. Chris Shaw**  
A neuroscientist, he discussed his insights into the future of the vaccinated.  
(Vancouver: May 2, 2023)

**Deanna McLeod**  
She testified about the COVID vaccine approval and trials.  
(Vancouver: May 2, 2023)

**Serena Steven**  
A former nurse, she testified on vaccine-related injuries.  
(Vancouver: May 2, 2023)

**Philip Davidson**  
A public service employee, he discussed job loss due to vaccine mandate.  
(Vancouver: May 2, 2023)

**Vanessa Rocchio**  
She testified regarding COVID-19 genetic vaccine injury and cardiac damage.  
(Vancouver: May 2, 2023)
**Jennifer Curry**  
She testified about her severe vaccine injury.  
(Regular Deer: April 28, 2023)

**Dr. Eric Payne**  
A pediatrician, he testified on the dangers of COVID-19 vaccines for children.  
(Regular Deer: May 28, 2023)

**Dr. Misha Susoeff**  
A dentist, he discussed third-party Informed Consent.  
(Regular Deer: May 28, 2023)

**Judy Soroka**  
She spoke of struggles with the vaccine mandate and medical treatment.  
(Regular Deer: April 26, 2023)

**Dr. Gregory Chan**  
He spoke of his experience in healthcare during the COVID-19 genetic vaccine rollout.  
(Regular Deer: April 26, 2023)

**Dr. Christopher Flowers**  
He testified regarding the clinical trial data reported by Pfizer.  
(Saskatoon: April 22, 2023)

**Dr. Maria Gutschi**  
She gave a presentation as a pharmacist and regulatory specialist.  
(Saskatoon: April 21, 2023)

**Steve Kirsch**  
He placed bets on “The Science” and discussed the statistics on vaccine data.  
(Saskatoon: May 20, 2023)

**Deanna McLeod**  
She testified about vaccine development and the changes to health safety regulations.  
(Winnipeg: April 13, 2023)

**Michael Maclver**  
An embalmer, he spoke about funeral industry abnormalities.  
(Winnipeg: April 13, 2023)

**Dr. Jay Bhattacharya**  
He spoke on the principles of the Great Barrington Declaration.  
(Winnipeg: April 13, 2023)
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

**Dr. Jessica Rose**
She gave an in-depth presentation about VAERS data on COVID-19 vaccines.
(Winnipeg: April 13, 2023)

**Dr. Joseph Fraiman**
He shared his experience in the USA during COVID 2020.
(Truro: March 17, 2023)

**Dr. Mark Trozzi**
An ER physician, he gave a powerful testimony on mRNA vaccines.
(Toronto: April 1, 2023)

**Laura Jeffery**
A licensed funeral director, she spoke about post-vaccine embalming.
(Toronto: March 31, 2023)

**Dr. Laura Braden**
She addressed the natural origin of COVID and mRNA vaccines.
(Truro: March 18, 2023)

**Dr. Patrick Phillips**
A medical doctor, he had his medical licence suspended by the College of Physicians and Surgeons of Ontario (as of May 2022 in relation to his communications on social media)
(Truro: March 16, 2023)

**Dr. William Makis**
An oncologist, he spoke about vaccine mandates and Informed Consent.
(NCI Virtual Testimony: September 18, 2023)
7.5.1. Pandemic Preparedness Plan

Introduction

Pandemics are nothing new, and depending on the definition, there have been about five since the devastating Spanish flu of 1918.

There are historical records of other major pandemics; perhaps none are more notable than the Black Death (the Plague) of the late Middle-Ages that decimated a large portion of the European population. These major health crises usually happen in civilizations that have significant international commercial exchanges, when the overall health of the populations are under huge stresses like famine or war.

These pandemics have left a profound imprint on the human psyche and a warranted fear of disease and death that, historically, were mitigated by reasonable public control measures such as quarantining the sick. However, these troubled times have also been accompanied by irrational measures like “othering” and “scapegoating.”

After millions of years of natural evolution and culture, basic principles of immunity and hygiene were developed to ensure that we live in harmony with the biodiversity that surrounds us in the environment and in our own individual ecosystem made up of our microbiota.

Because of the high levels of human interaction across the world, there is a growing awareness that local epidemics can spread to larger geographic regions and become pandemics of global concern. At the international level, there are agreements in place to harmonize the management of pandemics, using the best practices from the international community.

Although human beings have an instinctual fear of sick people who could transmit diseases, contact with other healthy human beings is far from being dangerous, despite what some germaphobes obsessively espouse. Unless someone is afflicted by a permanent genetic immunosuppression or transient epigenetic immunosuppression due to poor life habits and comorbidities, the risk is negligible.

In fact, contact with other humans, animals, and plants enriches the biodiversity of the microbiota, which in turn educates the immune system—the ultimate foundation of health.

Recklessly isolating and cutting people off from interacting with society results in disease. And when people are sick, one essential condition for their healing is human care and a reassuring human presence; this reduces a sick person’s stress level, which is otherwise immunosuppressive.

The threat level of a pandemic ought to be gauged by the excess number of severe cases requiring medical treatments and excess deaths when the treatments failed. It’s not enough that a new pathogen erupts and produces a local outbreak, which then spreads to more than one country over the span of a few months.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

If the levels of morbidity and mortality are not significantly manifested above the usual baseline population, it should not constitute a pandemic of international concern. It has to be managed locally with an appropriate epidemic management plan.

For respiratory diseases, which affect a significant proportion of the population, it could be challenging to accurately detect cases of a new respiratory virus, such as SARS-CoV-2, as many symptoms can be confused with symptoms triggered by other viruses such as influenza or other coronaviruses. Thus, the counting of excess sick people, above the baseline of other respiratory infections, can be inflated by erroneous attribution resulting from poor diagnostics.

The only objective way to monitor a pandemic on the local or global stage is to carry on in-depth analysis of all-cause mortality, as presented by Prof. Denis Rancourt and Pierre Chaillot.

The analysis of all-cause mortality, which cannot be biased by subjective attribution factors, leads to the conclusion that there was no COVID-19 pandemic caused by a particularly dangerous respiratory virus.

There were excess death peaks in various locations, but these excess deaths were better explained by the health measures deployed for example: the absence of early treatments; the use of ventilators; the use of end-of-life comfort medications like midazolam or Rivotril; the significant reduction in antibiotic use essential for the treatment of respiratory bacterial infections; and by the deaths of despair due to drug abuse and business closures in some sectors of the economy.

Interestingly, the analysis of all-cause mortality during the past century cannot detect significant excess deaths during all of the previous declared pandemics with the exception of the Spanish flu. This pandemic happened on the heels of WW1 on stressed populations that were weakened by fear, famines, and countless injuries, including respiratory airway damage due to the massive use of toxic gas.

And as we now know that the bulk of the influenza deaths during the Spanish flu pandemic were likely the result of opportunistic bacterial infections, treatable by antibiotics, the likelihood that a new respiratory viral pandemic will manifest a death toll similar to the Spanish flu is fairly unlikely.

This begs the question: Why were antibiotic prescriptions so drastically reduced during the COVID-19 pandemic, especially for populations that historically suffered from bacterial pneumonia?

World Health Organization Guidelines

For better or worse, over the past decades we have put in place pandemic plans at the supranational level, under the hospice of the WHO. We can now marshal the best scientific and risk management intelligence in case of a worldwide pandemic that threatens the entire human population. This appears, at first glance, a very noble and desirable objective.

Although this approach seems reasonable in theory, there are in practice two major issues with the centralization of pandemic management by a supranational organization of unelected bureaucrats.
The first one is the potential lack of accountability inherent in an organization staffed by unelected bureaucrats who may be perceived as are likely to be more loyal to the financial contributors of the organization, rather than to the member states. Since some contributors have major interests in the vaccine industry, this conflict of interest may be perceived to influence the agenda of the WHO, without firewalls to mitigate its unrestrained influence.

The second cardinal aspect is that proper management of pandemics cannot be effective if the management is not based on a localized approach. Indeed, many factors like the climate, the population density, age distribution, and cultural differences, to name a few, make the propagation of a disease very different from one country to the other. This cannot be managed centrally by distant bureaucrats that fail to consider the impact of local factors better appreciated by people closer to the terrain.

Furthermore, as people are fallible and corruptible, large unaccountable bureaucratic organizations are prone to foster abusive, self-serving policies that are exacerbated by incompetence and corruption. Nevertheless, individuals from these unelected groups, possessing varying degrees of expertise, are appointed to positions of authority without being held accountable to the public.

This conundrum cannot be corrected by the tax payer, who ends up financing these programs without real representation. As a result, the populations have little power to implement corrective measures when these programs are not delivering the best public health outcomes.

For every developed country, the healthcare system is the most significant budget item paid for by tax payers. As such, autonomy to manage healthcare services and public health measures should be the responsibility of elected officials who are accountable to their electors, not subjugated to supranational bureaucracies.

**Provincial Pandemic Plans**

Every province had an alternative pandemic plan available as of 2019 that was quite different than what was actually implemented. The national plan had been updated in 2016 based on sound public health practices that were developed from the hard lessons learned through previous pandemics. These plans were written together with all public health agencies and many other stakeholders, and they warned about the dangers of NPIs (for example, lockdowns).

By only considering the details of the mismanaged implementation plan, we are missing the real questions: Was the so-called “pandemic of international concern” properly defined? What was the real magnitude of the threat?

According to expert witness Lt. Col. David Redman, we failed miserably because there was no need to deploy these health measures in the first place, and on top of everything, the measures were not directed at the correct public health outcome.

In other words, before crafting, let alone deploying, a grandiose plan of social engineering on a massive scale, we need to ask in simple terms: To what problem is this plan the solution?
And if the problem is ill-defined, the solution is most certainly going to do more harm that good, especially in a fake emergency situation that granted permission to authorities to suspend our normal way of living and disregard personal responsibility. We were treated as a hazard, in and of itself, instead of an asset that would be part of the solution.

If the plan was to create havoc to destabilize the fabric of society, to produce significant morbidity and mortality while creating massive wealth transfer and concomitant impoverishment of the middle class through inflation and public debt, cynically, it was a success.

Strangely, what was actually implemented goes totally against the wisdom of the established pandemic plans that acknowledge that disrupting normal life is very costly both financially and from a public health perspective.

Therefore, from the perspective of public health and population autonomy, which are an essential need for the prosperity of a society, the management of the COVID-19 crisis was a total failure.

The “All Hazards” Approach

We all live in an environment filled with potential hazards, both short and long term. We need to respond to those many hazards with targeted mitigation strategies framed with risk–benefit analysis for each of these measures, be they passive or active. Obsessively focusing on one hazard is ill-advised and a recipe for collateral damage concomitant with neglecting other hazards or essential needs.

By neglecting to present a more balanced perspective of the emergence of a new respiratory virus, the WHO’s successive announcements, starting early 2020, revealed their intention to act as merchants of fear.

On January 20, 2020, based on 1,076 cases, of which only 83 confirmed cases were outside China, (on a population of 6.4B excluding China), the WHO, declared that the window was closing on a health emergency of global reach. This has to be put in perspective with poor case assessment based on confusing symptoms and RT-PCR testing not clinically validated.

A RT-PCR (Reverse Transcription Polymerase Chain Reaction) test is a diagnostic tool used to detect the genetic material (RNA).

On March 11, 2020 based on 44,274 cumulative cases, out of a global population of approximately 8.1B people, obfuscating a likely high proportion of recovered people that would have dampened the danger signal, the COVID-19 pandemic was officially declared. This announcement, of a pandemic, precipitated the worst financial market collapse since 1929. It has been alleged that many people took advantage of the initial market crash through insider trading.

And based on the WHO’s fear-mongering, gradually most of the 190 member states of the WHO most of the 190 member countries of the WHO initiated the ritual of lockdowns for two weeks, which extended to two years, to allegedly flatten the curve.
But what curve? In Canada, on March 9, 2020—two days before the pandemic declarations—there were 125 cases in a population of 38.5 million. The way these cases were determined may be suspect, and no information on the severity of the cases was provided. It is not known how or if these reported cases were clinically validated to be caused by the SARS-CoV-2 infection. Presumably this information could not be determined as the virus had not been identified at the time. Without this critical information, the public was led to believe that the virus was potentially mortal for everyone. This fear was magnified by media reports of people dropping dead in the street in China: fear-mongering on steroids.

In February of 2020, public health already knew that 95 per cent of people dying from what was later named COVID-19 were over 60 years old and had multiple comorbidities. This means that they should have been focussing on targeted protection.

The updates from the WHO showed the same profile every single week starting in March 2020. In Canada, the average age of death with COVID-19 is 82 years old with severe multiple comorbidities. A common characteristic of those who reported died is obesity—83 per cent for the most severely ill—but they didn’t report this information. Why was this risk stratification Not mentioned by any health authorities.

To make matters worse, the health measures discouraged physical exercise. And the stress led to overeating, often of processed food, and increased consumption of alcohol, which contributed to significant unhealthy weight gain of the population.

At the time of writing this Report, Theresa Tam was still broadcasting 52,000 deaths in Canada to keep on scaring people. Meanwhile, on the official Canadian government website, the number was 32,659, almost 40 per cent less. Importantly, Canada ranked last of the Organisation for Economic Co-operation and Development (OECD) with 73 per cent of deaths occurring in long-term-care (LTC) homes. And of the deaths in Canada, 93 per cent were of people over 60 years old.

At the outset of the pandemic there was a good plan to address this declared public health emergency. It was based on controlling the spread of the disease—not cases—while reducing morbidity and mortality by providing access to appropriate prevention measures, care, and treatment. It also entailed mitigating social disruption through ensuring the continuity and recovery of critical services, minimizing adverse economic impact, and supporting an efficient and effective use of resources during response and recovery.

Yet instead of following established emergency plans, many countries followed the game plan elaborated in the Event 201 pandemic simulation, organized in the fall of 2019. Although well intended, the framework of this pandemic plan was misguided by business and military people, along with a few doctors and scientists that had a strong bias in favour of NPIs.

The result of their exercise made absolutely no sense to many experts in public health crisis management. Yet Canada followed it to the letter. Only a few states didn’t: Sweden and Florida.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

And in spite of the harsh criticism and claims that they would be responsible for unnecessary deaths from COVID-19, both Sweden and Florida were vindicated for not following the script as other states had. Their “all-cause excess mortality adjusted for age” revealed death numbers much lower than many comparable states that had been more diligent on lockdowns and masks.

In Canada, we failed at all of the basic tasks of Emergency Management Plan (EMP). It does not appear that any of Canada’s health agencies conducted a systematic analysis of peer-reviewed literature of potential treatments for similar coronaviruses like SARS-CoV-1 or MERS. Nor did they conduct in real time, a cost–benefit analysis of the health measures deployed, using the best independent experts who were free of conflicts of interest.

When the portrait of a public health crisis is not painted with solid data that is put in the right perspective, the fear instilled in the population by decision-makers broadcasting a distorted picture of events results in massive collateral damage, as we have seen.

But it’s also possible that many fearful people were blinded by the feel-good ideology of “saving lives” at all costs. The multi-faceted aspects that must have been considered, which included collateral damages both at the individual and collective levels, were ignored.

With a narrow mind-set excessively focussed on the alleged danger of COVID-19, the public was trapped in the perceived dilemma of exchanging economic damages for alleged life-saving procedures: the effectiveness of which were only hoped for and not demonstrated. Moreover, the fact that economic stress could lead to bankruptcy and become the gateway for future morbidity, due to anxiety, depression, substance abuse, and suicide, was also ignored. So whose lives were being saved in the end?

Government measures failed to protect our most vulnerable—as evidenced by the death toll in LTC homes—and sacrificed our younger generation’s future. What can compensate for the precious years of socialization, language learning, and education lost by our children, who will also have to carry the burden of a national debt that ballooned from $750 billion to $1.3 trillion in one year?

To have deployed one-size-fits-all public health measures, as if everyone were equally vulnerable, is at best incompetent, if not malevolent. Why was there such a focus on the wrong NPIs? Many officials erroneously assumed it would protect the healthcare system.

The push to “protect” the healthcare system was motivated by the fear that if the system collapsed under the pressure of caring for excess sick people, the ability to provide care for other medical needs would also suffer. Paradoxically, to prepare for the anticipated flood of COVID-19 patients, treatment of other medical concerns deemed not as urgent were postponed by administrative edicts.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

On top of this, many people forfeited or avoided seeking medical care for other issues for fear of catching COVID-19 in the hospital. On what grounds did the administrative state know that the COVID-19 disease was a greater health threat than all of the other illnesses? Is it because they blindly believed so without proper assessment?

That irrational fear fuelled by the increasing number of RT-PCR positive COVID-19 cases, the majority of which were asymptomatic, led to a misplaced focus on future COVID-19 cases. Many of the COVID-19 deaths may have been generated in the first place by denying patients early outpatient treatment for the illness.

This was exacerbated by the continual perpetuation of fear and the disruption of normal social life, both of which contributed to the dampening of the immune system. For the most vulnerable, this no doubt led to increased susceptibility to diseases of all kinds, including COVID-19.

How Did That Happen?
According to the testimony of Lt. Col. Redman, it happened due to:

Incompetence: All of the premiers failed to do their own research to gain a deeper understanding of the pandemic’s true threat. Then, many premiers put the wrong person in charge; premiers should have retained final control of the situation as elected representatives. The medical officers were incompetent by refusing to acknowledge they couldn’t do it alone. Why did they, against the best practice recommendations garnered from previous pandemic management, use the wrong NPIs? When challenged in court, they could not produce a single cost–benefit analysis to justify it.

Hubris: Once you make a mistake, it’s difficult to admit it. Governor DeSantis did it in Florida, but it’s rare. After talking to the relevant experts, he admitted: “I got it wrong.”

Without acknowledging the mistake, course correction is very difficult and doubling down seems the only strategy until one is confronted by the evidence from censured documents, such as “The Lockdown Files” in the UK and the flurry of documents from the Twitter files. But these revelations were late coming, and the decision-makers felt they would be off the hook long enough to avoid confronting the consequence of their mistakes.

Self-gain: Politicians were on TV every night and the carefully crafted message, vetted by numerous polls, assured them to win their elections by not admitting their mistakes. The spin on the message was: “We did the best we could under the dire global circumstances; nobody could have done better, and now the crisis is behind us, let’s move on.”

Emergency Management Plan (EMP) and Recommendations
And yet, massive collateral damage has been done; we will be experiencing the enduring effects for generations to come. Not acknowledging the damage only makes matters worse as it precludes the implementation of much needed corrective measures and raises the dark prospect of repeating the same mistakes, or even worse, next time.
The plan to protect public health in case of a severe threat like a pandemic was diverted and turned on its head to protect the healthcare system. Scared public health officials responded to the scared public by focusing the plan on protecting the healthcare system as a proxy of the public.

They failed to recognize that the best strategy to minimize the strain on the healthcare system, be it for physical or mental health conditions, would be to promote good life habits: healthy food, physical exercise, vibrant social life, and other stress reduction practices. That would have reduced the likelihood of people getting sick or progressing to more severe forms of illness.

What did they do instead? They failed to acknowledge that seasonal respiratory diseases are in part the result of low vitamin D levels due to lack of sun exposure. They also stopped providing vitamin D levels due to lack of sun exposure, they stopped providing vitamin D supplementation in many LTC homes and prevented people from going outside to get sun exposure and fresh air where the risk of contamination was non-existent. By contrast, these vulnerable people were locked in poorly ventilated indoor environments, denied social activities that included family and friend visits, and were scared non-stop by the media about the danger of the virus.

Is that really the best way to prevent progression to severe illness? When people got sick under these poor health conditions—not to mention the poor quality of food in many LTC homes—and because COVID-19 was deemed untreatable, the elderly were offered end-of-life comfort medication. Can that explain why in Canada 73 per cent of COVID-19 deaths were recorded in LTC homes?

We must question the wisdom of blindly following the marching orders of the WHO as if infallible, particularly since the WHO seemed to work in tandem with the mainstream media and government-controlled social media to expunge from public discourse any questions about the pandemic plan du jour.

As revealed by “The Lockdown Files,” the pandemic was managed by uninformed people, and the WHO became the justification for all of the other states to follow the “clowns in chief,” as Dr. Didier Raoult put it.

From an epidemic perspective, efficient local measures are much more effective; there is not a one-size-fits-all approach. This is a clear example of the tension between two opposing governance philosophies: top-down global control under the pretext of security versus subsidiarity manifested in bottom-up local measures that respect liberty and individual responsibility.

**Recommendations**

**A. Rectifying the Mistake of Discarding the Emergency Management Plan:** The decision to discard the Emergency Management Plan was a significant error that will require rectification.

---

130 “The Lockdown Files” are a series of articles in The Daily Telegraph containing evidence, analysis, speculation, and opinion relating to more than 100,000 WhatsApp messages obtained from former health secretary Matt Hancock that were leaked to them.
B. **Realigning the Purpose of Pandemic Measures**: The objective of pandemic measures should have been to minimize the impact of SARS-CoV-2 on society, rather than solely focusing on safeguarding the healthcare system.

C. **Utilizing Hazard Assessment for Targeted Responses**: The Hazard Assessment, which continued to identify those most at risk, revealed that lockdowns did not effectively protect them. A more targeted response would have been more appropriate.

D. **Learning from Past Pandemics**: The lessons learned from previous pandemics were regrettably disregarded.

E. **Reevaluating Non-Pharmaceutical Interventions (NPIs)**: The use of non-pharmaceutical interventions did not significantly reduce the spread of COVID-19. Employing them during the initial wave could have been seen as, at best, a mistake. After the first wave, it became a matter of grave concern.

F. **Recognizing the Unintended Consequences of NPIs**: NPIs have resulted in substantial collateral harm and loss of life, often surpassing the impact of the virus itself. Public health was aware of this prior to COVID-19, and yet no cost-benefit analysis was conducted. This constituted a grave error.

G. **Holding Leaders Accountable**: Public authorities bear responsibility for the response to the pandemic and the perpetuation of fear. Accountability should be enforced.

H. **Safeguarding Our Society and Democracy**: Failure to revise our Emergency Management Plan and dispel false beliefs in non-pharmaceutical interventions places our society and democracy in jeopardy.
7.5.2. Follow the “Science”: Real Science or Scientism?

Introduction
From the start of the scientific era, which followed the Renaissance’s rediscovery of ancient Greek wisdom, to the industrial revolution that propelled us into unprecedented prosperity, our societies have increasingly depended on science and technology. In a world that’s becoming more materialistic and moving away from traditional spiritual practices that used to provide the foundation for our understanding of life’s meaning, we’ve even come to revere our technological achievements almost like sacred objects.

In a materialist world devoid of transcendence, the primary goals are the incessant accrual of power, status, and money, with everything they can buy. And everybody is closing the door of their golden cage while willingly accepting entrapment in it with all of their material comforts.

Paradoxically, as material comfort has become the ultimate hollow goal of life, the general knowledge of science and technology that underpins our material way of living has not received the attention required to equip citizens and decision-makers alike to propose optimal solutions in the face of complex problems.

To put it in simple terms, from the general public to the political class and everything in between, including the media, there is insufficient literacy in mathematics, the sciences, engineering, technology, and so on. Yet to those who master these disciplines, immense power awaits as they strive to capture the benefits of a growing monopoly on knowledge and technology. Hence, a new pseudo-religion and its mantra, “Follow the science,” has subjugated the non-critical-thinking crowd.

As explained by many witnesses, confusion due to poor understanding of the scientific process as well as poor knowledge of cutting-edge science in epidemiology, virology, and immunology in the political class, institutions, the media, and not to mention the general public, was at the root of the mismanagement of this public health crisis. It was a situation exacerbated by widespread corruption, as we have witnessed.

Data, Information, Evidence, and Knowledge
Most people have been mesmerized by all the data yet fail to understand the distinction between data, information, evidence, and knowledge. Data is raw facts, statistics, context-free numbers. Information is data that has been processed to provide a proper framework of the context. Evidence is yet another level in which the information is framed to generate testable hypotheses upon which evidence can be fortified. From validated evidence, a body of knowledge accumulates over time as the evidence underpinning it withstands the trial of repeated testing and reproducibility.
Needless to say, during the pandemic, authorities frequently fed the public data that was of questionable quality, validity, interpretation, and scrutiny. Meanwhile, the mainstream media, clueless at the best of times, happily disseminated and endlessly commented upon the data with an air of authority.

Tragically, the population was misled by propagandized misinformation: not through so-called misinformation spreaders on social media but rather through the orchestrated work of official channels, in concert with mainstream media and the censorship of social media.

When a fact is yet to be verified, it is best to specify that all the explanations proposed are hypothesis yet to be verified. A golden rule in research is that one does not develop hypotheses on hypotheses but on validated facts—all of the relevant known and verified facts, that is to say, on observations and the description of phenomena validated by the scientific method. In addition, the methodology of the research and the population on which it was carried out are to be considered before making generalizations.

The sample choice, the experimental protocol—which hypotheses were tested—and the statistical analysis of the results are of paramount importance when it comes to generalizing a negative or positive result from a study to a complete population. Cross-correlations, observer biases, sample size, and many other factors must also be considered.

The study of human beings is complex and the study of an entire population even more so. In the end, ideally, rather than the observation should be free and unbiased. When our observations are unbiased, we avoid getting bogged down by more confusion than knowledge—even if for some it is more reassuring or gratifying to formulate fanciful, often simplistic, explanations to the detriment of scientific rigour.

The most insidious of ignorance is not what we do not know but what we hold to be true without question and which turns out to be false.

Science is constantly evolving through rigorous exploration of new theories, which are bound to gradually change in nuance or be invalidated by new evidence. Thus, the “consensus” of the moment, supported by the majority of scientists, may eventually prove to be outdated or downright false in the light of new empirical findings.

This is compounded because too often results published in very good peer-reviewed journals have proven to be non-reproducible. How much of a problem is that? This is unfortunately very common in medical research as revealed by the famous article: “Why most published findings are false,” written in 2005 by eminent epidemiologist John Ioannidis, one of the most cited scientists in the world in the field of clinical medicine and social sciences.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

This article, the most downloaded from the Public Library of Science Medicine journal, is the most consulted article on the site with more than three million views. It has become an essential reference in relation to the difficulties linked to the reproducibility of scientific studies. Since the publication of this shocking article, a multitude of studies have come to corroborate this worrying observation.

In general, however, these difficulties are poorly documented because the system in place does not favour the dissemination of such information. Indeed, it is very difficult to publish results invalidating what has already been published in the scientific literature. This, therefore, singularly complicates the practice of scientific research and sets up researchers to embark on the wrong track.

This pre-mature publication of studies that cannot be faithfully reproduced is a serious problem, and it was greatly exacerbated in the COVID-19 era as a large number of experts from all walks of life rushed to contribute to the scientific effort to confront the pandemic. Discernment to avoid going astray requires research training and experience, which the vast majority of media commentators, who have little or no practical experience in scientific research, lack.

Any well-trained researcher is perfectly aware of the limitations unverified and unconfirmed data and examines with great circumspection studies that have not been reproduced by independent teams protected from conflicts of interest. Minimally, before fully embarking on a research project, it is necessary to begin by reproducing the crucial results at the basis of the hypotheses to be explored.

Ultimately, it’s not primarily about being right or wrong; it’s about fostering dialogue to gain a clearer collective understanding and to implement solutions that can improve the resolution of stubborn issues stemming from complex systems, which challenge our overly simplified analyses.

Despite anything the mainstream media, social networks, or our politicians might postulate, it is important to recognize that one cannot lie with physics or biology. We must be cognizant of what nature reveals to us, avoid the pitfalls of ideological filters that hide or distort reality, and act accordingly. We must be extra vigilant not to be bogged down by confusion, which is all the more comfortable when it is widely shared.

Scientism
We must make a clear distinction between the belief system or ideology of reductionist materialist science and the pursuit of knowledge that science engages in with an open-minded approach to all new discoveries.

This quest for knowledge, the which is built up through accumulated observations, the development of explanatory theories, experimentation and the generation of new data that confirm or invalidate current theories, should not be restricted to the physical material world alone.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The quest should encompass the entirety of reality, including the metaphysical and spiritual realms. However, this is where most materialistic scientists encounter difficulties. Despite new neurological evidence supporting both the placebo and non-placebo effects, many materialistic scientists still find it challenging to recognize the influence of the mind on physical health.

In this emerging pseudo-religion that materialist science has taken on, often presenting itself as the sole valid path to knowledge, we find ourselves marvelling at the immense capabilities of humanity. It's hard not to believe in our potential to achieve remarkable feats, given the extraordinary progress we've made since the Industrial Revolution.

We succumb to hubris, a trait warned against in ancient tales like the Tower of Babel or the story of Sisyphus, who challenged death. Armed with our science and advanced tools such as computers, we create models aimed at describing nature in immense detail, with the ambition of making highly precise predictions. In doing so, we believe we can alter the course of events with surgical precision, if needed.

We believe that everything would only have beneficial effects, without collateral damage. And we take ourselves for demiurges who can only make good decisions.

This intoxication of power pushes the limits of our ignorance into a blind spot. And the most ignorant are those who are convinced that they know enough but who understand only very superficially the evolving knowledge of science and especially its limits.

With their pseudo certainty, they derive narratives used to justify decisions and actions that cannot be doubted because they have followed the science. Any opposition to this scientific orthodoxy being decried as "conspiratorial" or backward is easy to denigrate, ignore, or censor. And the hunt for heretics is relaunched as in the days of the Inquisition.

It is as if the questioning of the dominant "consensus" of "accepted" science, of which the media is the mouthpiece, was in essence unscientific, ignoring that science fundamentally progresses according to an iterative process that does not sit well with a fixed dogmatism promoting a doxa to which we should adhere.

Knowledge is Not Wisdom
Wisdom invites us to cultivate the humility stemming from our ignorance, which is far greater than what we think we know. Complex phenomena cannot be reduced to simple causes that are supposedly invested with such high explanatory power that we can predict the future with an easily deployed computer model. For models to be valid, they should consider all parameters that can affect the system, as well as the degree of their combined interactions.
We often forget that at our stage of knowledge, these models have limited predictive power. They have to be constantly refined by empirical data, which is often difficult to obtain. However, it is sometimes possible to obtain the data when we take the trouble to compile and analyze relevant observations and the empirical tests of our theories. Retrospective and prospective studies are essential for closing the loop on our often risky predictions. These studies should teach us humility in the face of our cognitive limits and should influence us to exercise caution when we attempt to predict the future.

Unfortunately, the need to communicate, often on a daily basis, a simple message that is accessible to people who may not have the expertise (or the attention span) to appreciate the complexity of these systems, can lead one to propose simplistic, reductive explanations. Those can produce the illusion that we understand what is happening well enough to intervene only positively on the system. As Albert Einstein advised: we must strive to formulate explanations that are as simple as possible but not simplistic.

In our scientific exploration of complex phenomena, it is crucial to take advantage of the long experience of our ancestors who learned to develop strategies which, although imperfect, nevertheless made it possible to face difficult conditions whose complexity overwhelmed them. In other words, we must learn from past experiences, with their share of errors, so we do not have to rediscover knowledge already acquired at the cost of painful historical attempts at trial and error.

We must also be careful not to consider that new theories are necessarily better because they are more recent. The hegemony of these theories du jour is more often due to the philosophical, psychological, and cultural bias of the time than to their scientific merit.

There is a great body of ancient knowledge and wisdom that could be more valid than the new theories because it has stood the test of time. One must be wary of theories that deviate into militant ideologies under the guise of science. Above all, let’s remember that while science describes nature with ever-increasing acuity, it is powerless to advise what to do with this necessarily partial and provisional knowledge and technology. Knowledge may be one of the important elements of the process, but it is certainly far from sufficient to access wisdom.

One wonders what sort of world we live in when people refuse to be exposed to different viewpoints and quickly resort to denigration and censorship as a way to protect themselves from information that would challenge their worldview—our “religion.” Our world seems to be under the influence of two dominant ideologies: scientism in synergy with wokeism. Both ideologies are completely at odds with science.

---

Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The COVID-19 crisis exposed profound societal issues that existed before but had not been widely recognized. The pervasive sense of fear, especially among baby boomers, about death had in many ways numbed our ability to fully embrace and celebrate life. We saw a form of intergenerational prejudice during this pandemic in the willingness to mortgage the lives of the youngest to reassure the oldest.

This obsessive fear was rooted in the disconnection of the meaning of our lives as revealed in all the mythological, religious, and spiritual accounts of humanity, for millennia. In the dominant materialist narrative that we inhabited, there was nothing outside of the material dimension, and after the physical death of our bodies, that would be nothingness. This nihilism was frightening. It was also a source of fragility that the authorities exploited in order to govern through fear.

Recommendations

Considering the critical reliance of our modern society on science and technology, there is a need to distinguish knowledge derived from the rigorous scientific method from beliefs often influenced by ideologies and propaganda. To help distinguish between the two, we recommend the following:

A. **Basic training in epistemology and critical thinking** should be incorporated into both humanities and scientific or technological education curricula.

B. **Experts who participate in public forums** should undergo scrutiny based on the following four fundamental criteria:

   - Demonstrated cutting-edge knowledge and expertise, as evidenced by their involvement in past or ongoing scientific research, providing proof of their understanding of the subject under discussion.

   - Lack of conflicts of interest.

   - Willingness to engage in evidence-based public debates with other experts who may hold differing opinions. Such engagement should involve using rhetoric that avoids ad hominem attacks, appeals to authority, or invoking the mislabelled “scientific consensus.”

   - The detailed, unedited credentials of these public figures must be made known and available to the public. This will enable the public to ascertain the credibility of such experts.
7.5.3. Epidemiology 101 in the COVID-19 Era

Introduction

The concept of epidemiology dates back to Hippocrates, who observed that by and large, there were two types of diseases: endemic diseases, which occur continually in the population, and epidemic diseases, whose occurrences are sporadic, such as infections with unprecedented symptoms.

Although the science of epidemiology has made much progress since antiquity, understanding the occurrence and the evolution of a new disease that creates significant morbidity and mortality is still a huge challenge. The occurrence of a new pathogen—its transmission in human populations, the interaction with the infected host leading to diseases of varying seriousness, and the ultimate resolution of an epidemic as it progresses to the endemic state—is a highly complex multifactorial phenomena whose driving forces are difficult to identify. The relative contribution of the various factors is also very difficult to measure. We have learned a lot since the beginning of the modern scientific adventure, yet our knowledge is still very limited.

The paradigm of modern reductionist materialism, starting with Descartes, is that the world is like a machine whose parts interact with one another according to specific laws of nature written in the language of mathematics. According to this paradigm, all we need to do is identify the components and discover how they interact with one another. With that understanding, it’s assumed we can control the world.

That worldview has several shortfalls as it applies, for example, to the science of epidemiology and as it converges at the intersection of statistics, physics, biology, engineering, psychology, sociology, and politics. The many unknowns in all of the parts of this idealized machine, let alone in the ways they interact, make any modelling attempts to describe and predict how that works is at best naive, if not totally misleading, in many respects.

A flurry of mainstream media commentators took centre stage to project the illusion that epidemiology was a mature science able to predict the evolution and control of pandemics with sophisticated models fuelled by powerful computing. The reality was that what we learned about epidemiology over the past decades had not made our understanding of the COVID-19 pandemic any different than previous pandemics. This illusion of knowledge fooled many people into thinking that they could attribute the rise and fall of epidemic waves to specific human interventions or lack thereof.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The main innovation during the COVID-19 pandemic was the questionable deployment of the RT-PCR diagnostic as a proxy to follow the epidemic waves. Strangely, instead of monitoring the waves of sick people, public health focused their attention on the presence of a viral genetic sequence to define a “case,” irrespective of its consequence on morbidity and mortality. Moreover, despite the poor predictive power of the RT-PCR tests to inform disease progression, they were used in attributing deaths from COVID-19 to respiratory illnesses of all kinds and without formal demonstration. This created systematic errors of attribution that biased official statistics all over the world.

Over-reliance on Modelling

We were misled by models. Without delving into too many details, it is necessary to discuss the concept of viral transmission. The physicochemical interaction of an ill-defined biological agent, the virus—which is sensitive to all kinds of environmental conditions, like UV and humidity—travels in the air to enter the airway of another biological being, which will interact with this virus in different ways, depending on the robustness of the mucosal immune system challenged with an unknown viral load.

Combining all these parameters, which we cannot properly measure in a web of interactions, quickly becomes a combinatorial explosion of probabilities that are impossible to determine. Assuming we could measure all of the parameters, which we cannot, modelling is then challenged by the mathematical laws governing the interaction of the different components.

A relatively simple example is the law of fluid dynamics to estimate the virus transmission in the air, depending on the gravitational force, wind velocity, and humidity. As the equations cannot be fully resolved, we have to assume several measurements. Without those precise measures, what are we going to input as a modelling parameter?

The bottom line is that modelling is a useful tool to generate a working hypothesis, based on approximate assessment, to be validated by empirical measures. Modelling cannot make accurate predictions of complex systems. The limitation is not only the computing power but also the uncertainty about the input parameters to run the model. If the assumptions are incorrect, the output of the model is useless for prediction and is referred to as a GIGO model (garbage in, garbage out).

The over-reliance on models can be due to the difficulty in testing model predictions experimentally or due to the time involved to collect data before the model’s accuracy can be formally assessed. Nonetheless, when a modeller consistently misses the target by a long shot, it would be wise to question the assumptions and mathematical process used to produce its prediction.
A stunning example was the misleading prediction that resulted from inaccurate modelling. This modelling team had been repeatedly off target in their predictions for more than 10 years: notably in the last flu pandemic of 2009 and the mad cow disease debacle that led to the unnecessary slaughter of cattle herds and huge economic losses for UK farmers.

Proper Monitoring of Pandemic Progression

It follows that we must be very wary of modelling. The only way to determine if any human intervention will influence the progression of a pandemic is to carry out well-designed observational studies in randomized trials whenever possible to eliminate the unknown influence of confounding factors, while carefully avoiding random errors and monitoring systematic errors resulting from selection or information biases.

Only true experts with established credentials and a track record can generate and properly interpret those epidemiological studies. Many of those experts informed us of what to expect by making analogies with similar epidemics of the past. The inescapable conclusion of the careful analyses of the best experts, like Prof. Denis Rancourt and Pierre Chaillot, was that there were no pandemics of extraordinary magnitude in 2020–2023, as the authorities promulgated for those three years.

The scale of the pandemic was exaggerated, and in rich countries—with notable exceptions such as Sweden, Japan, and a few American states—the health measures deployed caused more damage to the health of populations than COVID-19 itself. Although Sweden had a bad episode in long-term care homes during the first wave in early 2020, they refrained from imposing lockdowns and ended up with much better public health outcomes.

Statistics compiled at the global level showed that the median age of people who died of COVID-19 exceeded the age of life expectancy and that the vast majority of seriously ill people had several other pathologies. This led Richard Horton, editor-in-chief of the Lancet, to declare in his September 26, 2020, op-ed that the COVID-19 pandemic was truly a syndemic. That is, COVID-19 disproportionately affected the most vulnerable. Healthy young people were more than 1000 times less likely to be seriously ill or die from it. In these circumstances, he was advocating for more nuanced public health measures, as did the signatories to the Great Barrington Declaration.

Furthermore, the peak of excess deaths observed in different regions of the world coincided with the drastic measures put in place to manage the perceived threat. It’s almost impossible that those excess deaths were caused by the dissemination of a deadly virus which didn’t spread across borders and remained in discrete locations within a state or across states.

The drastic measures included (1) withholding early treatments, (2) inappropriate use of ventilators that restored anoxia in COVID-19 patients deprived of early treatments, (3) withholding antibiotics to treat incidental bacterial pneumonia, and (4) comfort end-of-life treatments for patients deemed incurable.
An accurate account of the COVID-19 pandemic revealed the story of a statistics fraud. What did they count? The definition of pandemic was changed. It became a statistical pandemic with cases. After changing the definition in 2009 by ignoring the gravity criteria and only counting numbers of sick people, the WHO further changed it in 2020 to count cases— including people who may not have been sick. Looking at all-cause mortality adjusted for the age pyramid, we note that 2020 was among the lowest since that statistic has been recorded. Nothing happened, anywhere in the world.

As for hospital saturation: for example, in France, even with the dubious attribution of hospitalization due to COVID-19, those patients made up only about two per cent of hospital occupancy. The only apparent hospital saturation was induced by an administrative decision to send all the respiratory-symptom patients (up to three million in France) to only seven of the 1500 hospitals.

Because of the planning already in place in anticipation of COVID-19 waves, hospitals were emptied, and people avoided them due to fear. As a result, the occupancy was much lower for many months— for example, 50 per cent empty in April 2020. No pandemic was evident when measured by an increase in respiratory disease by the sentinel network, a monitoring system. To put the data in perspective, during the worst previously reported pandemics, the sentinel system recorded up to 800 cases per 100,000 population, like in 2014–2015. During the COVID-19 pandemic, the number never exceeded 150 cases per 100,000 population. If one adhered to the definition of epidemic as an excess number of sick people, there was no epidemic in 2020, 2021, and 2022.

**Pandemic by Alleged Fraudulent Testing and Attribution of COVID-19 Cases**

Mainstream media reported alarming surges in COVID-19 deaths worldwide, which were determined not solely through initial RT-PCR testing but by the WHO’s coding ICD-11, implemented on January 31, 2020. This method was seen as a broad and scientifically questionable way of attributing deaths to COVID-19, often based on superficial symptom diagnoses with or without confirmation via RT-PCR testing.

When all respiratory infections were broadly categorized as COVID-19 cases, it led to the creation of misleading “epidemic” curves on the *Our World in Data* website. In reality, the spread of a respiratory virus infection did not align with synchronous events in numerous countries; some were merely delayed in adopting the ICD-11 code, while others had not yet implemented rigorous health measures.

The statistics showed that following the implementation of ICD-11, all other respiratory diseases seemed to gradually disappear and become COVID-19, even when the virus had not been detected. Perverse financial incentives appeared to trigger a diligent transfer of coding attribution.
There was an increase in deaths in some places, like France, that had instituted strict measures in April 2020, but not in other countries, like Germany, that didn’t implement those measures. The so-called first waves occurred in a minority of countries or regions. This could be seen all across Europe and even across different provinces in France, as only 14 out of 100 provinces showed excess deaths, and the spike of excess deaths correlated with the stringency of implementing health measures. The same thing happened in the USA.

Furthermore, excess deaths were overrepresented in “deaths at home” due to the lack of treatment because sick people refrained from going to the hospital. Even if most were attributed to COVID-19, there was no proof because autopsies were not performed.

For example, there were 5200 deaths at home during the COVID-19 period in France, and 4800 of those deaths were from “stroke and heart attack, non-treated” during the same period in a given database, while another database reported up to 6000 deaths from stroke and heart attack. Therefore, every one of the 5200 deaths at home could be accounted for by the lack of treatment.

In the same vein, the reported 5000 excess deaths in LTC homes for the elderly were equivalent to the number of people treated with midazolam instead of Rivotril, as the stock had been exhausted by the U.K., the USA, and Canada.

The rationale was that COVID-19 was a deadly, untreatable disease. Therefore, hospitals would be saturated, and there would be no room to treat the sick elderly; instead the reasoning was give them palliative care for this deadly incurable disease.

In France, the most prevalent place of excess deaths was in hospital. An incredible spike of 6000 out of 7000 excess deaths in three days was reported, with 3000 on the same day. This can only be explained by two reasons: (1) people coming to the hospital were already very sick, and (2) the common treatment in ICU to put patients on ventilators was associated with a high mortality rate. The three causes described—denial of early treatments, ventilators, and palliative care—accounted for the bulk of excess deaths.

The RT-PCR tests were the driver of the statistical fraud. A test was not the reality. For example, the pregnancy test although very accurate has both false positive and false negative results. If we tested everyone, we would get falsely positive pregnant men and falsely negative pregnant women.

We required additional medical data to establish the reliability of the RT-PCR test. By testing everyone, including those without symptoms, we identified a substantial group of asymptomatic COVID-19 cases who were even believed to be capable of spreading the virus. This raised questions about how they could transmit the illness if they didn’t carry an infectious virus but rather viral RNA sequences. If non-ill individuals who tested positive could transmit their non-sickness to others, it implied that everyone had the potential to be a source of infection. Moreover, the RT-PCR test had not undergone formal validation with a gold standard, as was the case with pregnancy tests.
Say the PCR test is 95 per cent reliable, and we tested everybody indiscriminately and found that both asymptomatic and symptomatic people were positive, on average, less than 5 per cent of the time. We would say, then, that the test lacks coherence.

Positive PCR testing over-represented the asymptomatic—detecting, more frequently, people who were not sick while missing people with symptoms—75 per cent of the time. Therefore, these symptoms were most likely not representative of COVID-19 disease. It was a “case-demic.”

During the Omicron phase, the percentage of positive RT-PCR tests increased dramatically to more than 30 per cent in France. Was it truly due to increased viral circulation, or was it from modifying the testing protocol?

In France, the combination of RT-PCR tests, COVID-19 vaccines, and the vaccine pass produced strange epidemic curves that were better explained by human behaviour because the RT-PCR tests were not coherent. Putting the vaccine pass in place created an artificial vaccine efficacy. The only efficacy seen in the randomized clinical trials (RCTs) in France was a reduction in RT-PCR positive tests.

If vaccinated people were not obliged to get tested, a bias of positivity of unvaccinated people who were obliged to get tested would be created. Similarly, when it was revealed that the vaccine was not preventing transmission and that the vaccine efficacy waned over time, people who were anxious about the possibility of infection, got boosted. At the same time, people who refused boosters, which were mandatory for an up-to-date vaccine pass, had to be tested more often. As a result, the boosted people tested less than the double-vaccinated or the unvaccinated, and that created the illusion that the booster worked.

However, as soon as the vaccine pass was lifted, the curves inverted because the boosted people, being more anxious, were testing themselves more often than the double-vaccinated or unvaccinated people that no longer got tested when it was not mandatory. It was all a statistical illusion.

The chilling implication of this rigorous statistical analysis of the official data was that it was a sham pandemic perpetrated by the military and administrative state through a sophisticated psychological operation against the civilian population.

While some people may have died from a virus, which probably escaped from the Wuhan lab, the deaths did not show up in the excess-death data. Deaths from the three other declared pandemics since WW II also did not show up in excess-death data. But wars did, intense heat waves did, and earthquakes did, yet proclaimed pandemics did not, except the Spanish flu.
A pandemic should be characterized by a significant excess of sick and dead people, not unreliable RT-PCR positive cases. The definition was perverted by an unvalidated display of pandemic waves that instilled fear in people and compelled them to submit to never-before-accepted NPIs as a prelude to the vaccination campaign that was sold as a relief to the unsustainable harmful health measures.

**Recommendations**

Due to the confusion caused by improper testing for COVID-19, particularly using unvalidated RT-PCR testing, the following recommendations were made:

A. **Pause the use of RT-PCR** or rapid antigen testing when it is not accompanied by a thorough medical evaluation of disease symptoms.

B. **Conduct a rigorous validation of RT-PCR testing**, including standardized cultivation of the active virus. Establish a defined threshold for the number of amplification cycles that show due used.

Considering the confusion that arose from the lack of transparency in official public data, the following recommendations are added:

C. **Ensure that all government data** is consistently and transparently shared with the public for independent evaluation by qualified experts in epidemiology and statistics.

D. **Make any disparities between data analysis**, done by the government and data analysis done by independent citizens, subject to review by an impartial advisory committee composed of experts in epidemiology and data analysis. This committee should be regularly vetted through public forums to maintain transparency and accountability.
7.5.4. Non-Pharmaceutical Interventions

Introduction
The use of NPIs based on previous pandemic management had been studied for 20 years and updated in September 2019. One of the main concerns about the NPIs used in the COVID-19 pandemic was the glaring lack of a cost-benefit analysis for them.

According to the recommendations in the pandemic plan, there were NPIs which were not recommended to be used.

We were told that certain NPIs would not be used, such as contact tracing, quarantine of exposed individuals, workplace measures and closures, school measures and closures, entry and exit screening, internal travel restrictions, and border closings.

Shockingly, despite the updated pandemic management guidelines for NPIs, many optional and never-to-be-used NPIs were not only used but were mandatory. One of the worst measures was school closures, which will leave indelible traces on our children for decades to come unless we implement robust corrective measures.

From many published studies that compared countries with different NPIs policies, we relearned in September 2020 that the cost-benefit analysis of most NPIs was negative.

Collateral damage from NPIs included massive damage to our individual mental health and our social fabric; other severe health conditions; damage to our children’s education and socialization; and our economic wellbeing as individuals, in business, and as a nation.

More than 400 studies documenting the collateral damage have been ignored by mainstream media.

Conclusion
There was malpractice by public health and individual healthcare practitioners. Relentless vaccination and denial of alternate treatment were rivalled only by bureaucratic stubbornness.

COVID-19 was not more serious than seasonal flu. Had we ever used such NPIs before, except during the Spanish flu? If they were deemed useful for COVID-19, why had we not used them for other pandemics? If COVID-19 had actually been a grave pandemic, what state-of-the-art NPIs would have been used?

Lockdowns
The stated reason that lockdowns were implemented in March 2020 was to flatten the curve in order to protect the healthcare system. Border closures and shutdowns of businesses not deemed to be essential were also mandated to close.
Then, to prevent a second wave, mask mandates were put in place to stop transmission of the virus. The absurdity of such a measure was displayed by its arbitrary rules: for example, masks could only be removed in a restaurant when seated at a table. Other arbitrary measures, like curfews and internal border restrictions based on colour-coded regional zoning, were also farcical.

What about the best practices learned from the past to control respiratory virus epidemics? In 2006, a WHO study on the Spanish flu concluded that lockdowns had no impact and were not practicable. A 2006 paper by the most renowned epidemiologists became the basis for the WHO 2007 plan, which was renewed without change in 2019. No study supported the confinement of sick people for extended periods of time to slow down a pandemic. Because the negative consequences were so dire, the recommendation was that it should never be used. Border closings and restrictions on travelling have always been inefficient.

Among all NPIs, only two have shown some efficacy: air filtration and isolation of sick people. Aggressive NPIs must be abolished, and their further adoption must be proscribed.

When a virus is already in the population, the most dangerous thing to do is confine sick people with non-sick people because the constant exposure within the same unfiltered air increases the likelihood of infection with an even higher viral load, which in turn would be more challenging to manage.

We had already discovered, at the beginning of the 20th century, that people sick from the flu or tuberculosis healed better if their sanatorium beds were put outside. That taught us that contamination was lower outside, in fresh air, so why did we strictly enforce lockdowns on the elderly and keep them indoors for weeks?

Mandatory lockdowns, without considering the impact, actually exacerbated the epidemic waves rather than improved the situation. Conversely, when people had the freedom to move, their exposure to the virus was less frequent, resulting in lower viral loads. In cases where everyone gathered in “essential” stores, like liquor stores, the crowds became more concentrated, leading to a higher risk of contamination with higher viral loads. A study in Spain demonstrated that essential workers were less likely to be infected compared to people who were under strict lockdown. To comprehend this phenomenon, it’s crucial for models to align with real-world observations.

Is Wearing a Mask Appropriate?

Where were the studies supporting the obligation to wear a mask? According to a WHO report published in 2019, just before the pandemic, the studies listed did not find masks effective in preventing the infection of influenza (a respiratory virus similar to the coronavirus). Arruda in Québec and Fauci in the U.S. initially told us the same thing before they changed their tune, without relying on new studies.
Moreover, the CDC chose to rely on the only subsequent study, done in Bangladesh and published after the decision to impose the mask. The CDC used it as a posteriori justification. This study was criticized by several experts, one of whom went so far as to demand either a major correction of its dubious conclusions or the withdrawal of the article published in *Science*, alleging serious shortcomings in the study.

Is it illogical to question the CDC’s sound judgment regarding masks, considering its initial stance that vaccination offered better protection than natural immunity? Their position on the effectiveness of masks is primarily based on a single study it funded, despite the existence of over a hundred published studies during that period that indicated otherwise?

In addition, a recent study in Europe concluded that countries that practised diligent mask wearing did not present better epidemiological results than countries where mask wearing was less strict. The higher mortality in the most compliant countries even suggested a potentially deleterious effect associated with wearing a mask.

**What Should We Think of this Study?**

In Sweden, where masks were not worn at school, the epidemiological data were at least as good, if not better than, Canada or the other Nordic countries. The results of these studies do not consider the collateral damage of wearing masks.

A Danish study concluded that the mask was ineffective, despite strong controversy in the media. Also a study from Finland, in two cities with comparable demographics, concluded that the efficacy of the mask was at best null or even negative.

Why were these studies not considered more seriously? Even more surprising was the absence of more randomized studies which would have made it possible to settle the debate in a more rigorous way. There were ample opportunities to do so during two-plus years of the pandemic.

**Administrative State Confusion and Future Solutions**

The state apparatus did not have a monopoly on scientific knowledge. That was partly because in the public service, promotion to decision-making positions was often based less on scientific excellence than on compliance with a certain doxa, which was subsequently exploited by politicians in support of their agenda. It was not just a Canadian problem; it was widespread throughout the world, and it has gone on for many decades.

Every time you hear “the experts say,” ask yourself some questions: Which experts? What is their claim? Are they exempt from conflicts of interest? Are they prepared to fairly debate the basis of their expert opinion?

Among other things, the COVID crisis exposed worrying gaps in the science literacy of politicians and the media, as well as in the expertise of state agencies where scientists and doctors worked. This problem was exacerbated by a lack of leadership to access the best expertise available at the national and international level and, above all, to use it wisely.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

It was not that there was a lack of competent and well-meaning people in the state apparatus; it was mainly that their voices were not sufficiently heard and considered in a centralized system where dissent was not valued. While the experts who promoted the “right message” got all the positive media attention, the whistleblowers and other dissenting voices were not only ignored but actively sanctioned. This meant that we heard them not at all or very little. We could therefore be fooled by the reassuring use of the phrase scientific consensus, which made us believe that the health authorities knew what to do. All that remained was to obey; otherwise, beware of the consequences.

Understandably during the first weeks, we were in a phase of bafflement, which rallied us to the injunctions of public health. However, when the data became available, we could have adjusted the course to prevent the two weeks to flatten the curve from being unduly prolonged. How could we have seen more clearly through the confusion and propaganda?

This crisis was managed by relying on models disconnected from the reality on the ground and by inciting fear of an invisible deadly enemy. Fear, one of the most powerful emotions, was used to manipulate or influence us. The techniques were similar; it was just a matter of intention and honesty.

The distinction was notable in that manipulation sought to alter someone’s behaviour for the manipulator’s gain, often by feigning to act in the manipulated person’s best interests to extract their willing compliance. Conversely, influence sought to prompt changes in opinions, decisions, and actions that would benefit the influenced person, and it involved their voluntary choices rather than coercion.

When we talk about war, we’re essentially discussing the use of propaganda to immerse us in a narrative with questionable ethical foundations. This war narrative propaganda narrative proposed straightforward and seemingly advantageous answers, stemming from a limited perspective that had shaped our societies since the onset of the industrial revolution. It was constructed upon a reductionist and deterministic materialism that had evolved over recent centuries. This materialistic viewpoint, responsible for elevating humanity from dire poverty, also drove us toward relentless consumerism, even in areas like healthcare. As a result, we have strained the delicate equilibrium of our environment: our actions risk damaging it and we despoil it at our peril. And we now know our health is inextricably linked with our environment.

In the United States, the annual budgets devoted to health, including food, is approximately $4.5 trillion, or about five times the defence budget. Health is one of the most important engines of the American economy and, by extension, of the world economy. This economic fervour has been irresponsible and has occurred without the recognition that humanity is an integral part of the natural world, and our actions risk damaging it.
The current crisis will necessitate fundamental changes to guide humanity toward a more harmonious coexistence with nature. This crisis has the potential to awaken our consciousness through spirituality, which goes beyond the realms of science and technology, drawing from the timeless wisdom of humanity, which is constantly evolving.

Our challenges run deep, and the transformations ahead will be protracted and marked by hardship. Consequently, it will be imperative to exercise patience and cultivate resilience.

In terms of scientific progress, we have entered an era of spectacular discoveries in genomics, which has opened up the world of epigenetics, the microbiome and the virome. Epigenetics has returned the natural environment as central to our health. We have also made considerable progress on knowledge about this wonder that is our immune system, the main source of our healing from infections and cancers.

Although there is still much to discover, we know enough to understand that the majority of diseases that afflict us—whether infections, cancers, or autoimmune diseases—result from erratic functioning of our immune system. The causes are sometimes genetic but are more frequently epigenetic, and we know with certainty that we can have a major impact on epigenetic causes through a healthy lifestyle.

Simply put, a good diet, including a supply of vitamins and minerals; restorative sleep; exercise and relaxation activities, such as walking or meditation; and nurturing social bonds, which helps to reduce stress have been clearly recognized as having an immunosuppressive impact.

During the last two years, have our health authorities seriously promoted a healthy lifestyle or, on the contrary, have they considered several of these protective factors as non-essential?

What price will be paid for delayed treatments of the various pathologies, the anxiety disorders of the young generations who suffered major disruptions in their social and emotional development, and the psychological distress of small entrepreneurs and their families who were forced into bankruptcy? This mental stress has had a major impact on our immune system and is likely to culminate in an outbreak of chronic psychosomatic illnesses in the years to come.

Reviewing the management of the COVID-19 pandemic, it would seem that the germ theory of infections, developed by Louis Pasteur, prevailed over the alternative paradigm promoted by Antoine Béchamp and Claude Bernard, two contemporaries of Pasteur who affirmed that “the microbe is nothing; the terrain is everything.”

According to some historians, Pasteur finally adopted this idea at the end of his life, but several of Pasteur’s heirs still do not have the memo. And yet, an increasing number of immunologists adhere to this idea that a properly functioning immune system, innate and acquired, confers upon an individual the ability to resist infectious pressures of all kinds, with rare exceptions, as well as the various cancers, which do not fail to develop with age in an environment polluted by all kinds of toxic substances.
The worst of these toxins are those that affect the balance of our microbiota, which plays a fundamental role in our homeostasis, including that of educating our immune system. Several scientists reflected that fact when they said that the greatest threat during the pandemic was not the virus but the measures that contributed to weakening our immune system.

The victims of COVID-19 were overwhelmingly elderly people, often sick, and people suffering from several health problems, particularly obesity. Obesity confers greater susceptibility to all sorts of ailments, including the progressive resistance to insulin and to leptin, a key hormone in lipogenesis and essential for the proliferation and homeostasis of immune system cells.

Therefore, the best possible preventive health measure for the next pandemic would be to put in place incentives to mitigate the current epidemic of chronic diseases mostly derived from the consumption of processed food full of fructose and poor in dietary fibres essential for the homeostasis of our microbiota.

Recommendations

In line with the “first, do no harm” principle and adhering to best medical practices and sound scientific practices, the following recommendations are proposed:

A. Avoid mandatory health measures, such as lockdowns and universal mask mandates, unless they have been objectively demonstrated through rigorous studies to have a positive benefit-risk ratio.

B. Prioritize diligent implementation of the two non-pharmaceutical interventions (NPIs) that have a well-established track record of efficacy in managing respiratory infections: air filtration and isolation of individuals who are both sick and contagious.

C. Establish a targeted research and development program to investigate the adverse effects of ineffective NPIs, with a specific focus on the impacts of masking children and restricting physical and social activities. The goal is to formally assess the extent of physical and mental health damage and propose tailored remediation measures.

D. Ensure that scientists and healthcare professionals working within government agencies have access to the best available scientific evidence, free from conflicts of interest, at both national and international levels. This access will enable them to provide politicians with the highest quality and most up-to-date knowledge for decision-making.

E. Instead of prohibiting them, mandate scientific debates to facilitate the emergence of optimal health measures. Encourage open discussions among experts to foster innovation and evidence-based policy-making.

F. Actively promote healthy lifestyles that can enhance the immune system through epigenetic mechanisms. A strong immune system forms the foundation for protection against infections, cancers, and autoimmune diseases.
7.5.5. Early Treatments

Introduction

According to a large number of attending physicians and researchers, an important pillar of pandemic management which was particularly evaded, not to say actively suppressed in most rich countries, was the off-label use of generic drugs whose harmlessness had been demonstrated by decades of use on large populations.

Recommending against early treatments was based on layers of lies, cowardice, and treason to the Hippocratic oath. Sadly, the decision to suppress early treatment exposed the corruption of our institutions, which enthusiastically persecuted the courageous doctors who dared treating COVID-19 patients with all kinds of generic drugs that had been part of the pharmacy for decades and for which the safety profile had already been well established.

Meanwhile, the majority of doctors sat in silence as accomplices of the colleges of physicians, doing treatments discreetly, underground, or doing nothing, out of fear of retribution.

Using an approved drug off-label was far from unusual, as the majority of drugs are prescribed off-label. The fact that drugs proposed as early treatments had not been officially approved by the health agencies for COVID-19 treatment was a bogus excuse to suppress their use.

Besides, we were in the middle of a pandemic, and in the past, the recommendation was to try any potential generic drugs to get some therapeutic benefits. However, the advent of any potential treatment posed a serious threat to the eventual interim authorization of the COVID-19 vaccines. The suppression of early treatment was not for public health reasons—quite the contrary. The data speaks volumes: the death toll was much lower across the world where early treatments were deployed en masse.

Unfortunately, for the longest time, the medical establishment in collaboration with the health authorities collaborated to justify their harassment of the courageous doctors. They claimed to have been protecting the public against alleged snake oil peddlers. To this day, the health authorities have downplayed the importance of vitamin D in the prevention of infectious seasonal diseases, which occur more frequently in the winter when vitamin D levels typically drop below the healthy threshold.

Even in the face of all the evidence on early treatments, advocates were ignored and vilified by the authorities. The c19early.org website regularly updated all observational studies, randomized trials and meta-analyses. As of August of 2023, there was a real-time compilation of 3013 studies examining 4468 potential COVID-19 treatments, of which 52 have already been approved as early treatments in 102 countries. Of all these treatments, ivermectin was among the most effective, with 62 per cent improvement observed in 99 combined studies enrolling 137,255 patients. Ivermectin was recommended in several countries, including Japan, where it was created.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

In spite of the evidence, several attending physicians experienced enormous difficulties, including sanctions. In order to prevent the physicians from deploying ivermectin and the panoply of other treatments which were used freely in several countries, the authorities threatened to revoke, and sometimes did revoke, their licence to practise medicine.

Without speculating on the motivations that led to such a suppression of early treatments, it is likely that the recognition of any treatment whatsoever would have compromised the interim authorization of the experimental vaccines that, by April 2020, were being promoted as a panacea for the pandemic. This all-vaccination strategy required that any valid therapeutic approach be inoperable. And that was what happened, whatever the real intentions were behind those decisions.

It appears, and it is noteworthy, that not a single one of our health agencies did a systematic analysis of peer-reviewed literature of potential treatments. Some bureaucrats, when challenged in court, claimed they were unaware of the information on the c19early.org website. Instead, they cited as gospel the information on the Health Canada website.

Pioneers of Early Treatments
Many doctors faced being reprimanded by their regulators for treating their patients, and many paid the price for their courageous actions to respect their Hippocratic oath. In many states, even taking care of sick people in person was discouraged to fuel the perceived dangers of COVID-19 that propaganda equated with the Spanish flu.

Even earlier on, we knew that this was a lie. The data had clearly shown that in terms of adjusted life years lost, the death toll of the Spanish flu was about 100-fold higher than COVID-19, and they treated the sick people back then.

Considering that many frontline care workers treat Ebola-infected people at their peril, we have to appreciate the level of fear-mongering that made healthcare workers so afraid to take care of putative COVID-19 patients and led them to mistreat the “dangerous“ unvaccinated.

Among the pioneers of early treatments was Professor Didier Raoult. By following the scientific literature, he found that hydroxychloroquine (HCQ), a drug he was familiar with for the treatment of malaria, had been shown to be an effective COVID-19 treatment by a Chinese team. He immediately tested it in his institute, the Institut Hospitalo-Universitaire en Maladies Infectieuses de Marseille (IHU of Marseilles), and found very interesting results, both alone or in combination with azithromycin (AZ).

His first report attracted some positive comments but also some surprisingly negative ones. While many other doctors in France and across the world followed up on these initial successes, a targeted campaign of denigration was put in place to suppress the use of HCQ by any means.
All of a sudden, HCQ not only had to be shown to be ineffective by fraudulent trials, but it also had to be shown to be toxic. The infamous Lancet-gate paper fraudulently claimed a 10 per cent cardiac toxicity based on fabricated data that had to be retracted in a few days. However, as soon as the Lancet paper was out, the Minister of Health used it as a pretext to suppress the use of HCQ in France for COVID-19. Astoundingly, after the paper was retracted, the Minister maintained his proscription of HCQ. This had a chilling effect on HCQ use in France, even to this day.

Prof. Raoult, against wind and tide, continued to use the HCQ-AZ therapy at the IHU. He published the largest observational study, with more than 30,000 IHU patients, showing an indisputable benefit of the combination of HCQ and AZ for the early treatment of COVID-19. In an unprecedented move, he had his study verified by a bailiff as a preemptive measure against the horde of fact-checkers paid by the corrupt mainstream media on behalf of the political establishment.

The saga continued. His study was attacked by the French medical establishment, fighting ferociously to avoid the judicial consequences of having suppressed this early treatment and be found responsible for preventable deaths of thousands of COVID-19 patients.

Another important pioneer in the development and use of early treatments was Dr. Peter McCullough. In August 2020, in front of the Texas Senate, he presented his work on the various phases of SARS-CoV-2 infection—viral proliferation, cytokine injuries, and thrombosis—that have discrete symptom manifestations but overlap over the 30 days of COVID-19 disease.

Dr. McCullough was among the first to actively promote to the medical community a panoply of various treatments that could lead to very effective therapeutic support for COVID-19 patients. His treatments included intracellular anti-infectives, antivirals, antibodies, corticosteroid, immunomodulators, and anti-platelet, anticoagulants. His clear message, based on his medical practice, was that many therapeutic interventions were available to avoid serious disease and death from COVID-19.

This message was echoed by other pioneers, like Dr. Pierre Kory and his colleagues at the Front Line COVID-19 Critical Care Alliance (FLCCC). Dr. Kory made a remarkable presentation in front of the U.S. Senate in December 2020 to promote the use of ivermectin, which had shown solid clinical results.

Although the promise of ivermectin had been strongly disputed by authorities in several countries, a flurry of examples demonstrated its clear effectiveness. Again, as with HCQ, ivermectin was attacked by the medical establishment in many creative ways to suppress its use.

After successes in Mexico, Peru, Japan, and India during the Delta wave where the majority of states treated with ivermectin, the waves lasted 40 days and caused comparatively half the number of deaths in the states that treated, such as in Uttar Pradesh, versus states like Kerala, which had banned ivermectin. At that time, only three per cent were vaccinated in India.
The Delta wave in India was much weaker than in France, which curiously experienced two delta waves that spread over several months, while the wave quickly subsided in India. During the first Delta wave, the vaccination rate in France was 40 per cent; during the stronger second wave, the vaccinated rate was 80 per cent. India’s better performance could not be explained by a low rate of infection in the population because serological tests in June–July 2021 (in 21 of the 30 states in India, enrolling 37,000 people), 67 per cent of people were identified as infected and contributing to herd immunity.

In India, the Omicron variant arrived 10 days later. They had 20 per cent fewer cases than with Delta, and it subsided earlier than in France. France had 10 times more cases with Omicron than with the Delta. In India, natural immunity provided much better protection than did the genetic vaccines in France.

States that treated with ivermectin had much weaker Omicron waves than states that did not treat. For example, in Nigeria (220 million inhabitants) there were 10 times fewer deaths with Omicron (69) than with Delta (800) and 444 times fewer deaths than in France.

These observations strongly suggest that the combination of natural immunity with early treatments such as ivermectin, which is both preventive and therapeutic, was a very effective approach for the control of the COVID-19 pandemic.

Recommendations
Given the incontestable better outcomes in countries that deployed early treatments using a panoply of generic molecules with an established safety record for the management of the COVID-19 epidemic, our recommendations are to:

A. **Reinstate positive incentives** to allow physicians to practise medicine according to an ethical, personalized, and evidence-based science and art, according to their Hippocratic oath. Repudiate algorithmic centralized protocols and punitive administrative edicts.

B. **Investigate alleged corruption** that has interfered with the customary practice of medicine under the fallacious pretext of promoting public health while diverting the health measures to alternative political and commercial interests.

C. **Promote preventative health measures** grounded in healthy lifestyles and real food, avoiding processed foods and sugar overconsumption and promoting adequate vitamin supplementation, physical exercise, sufficient sleep, stress management, and a vibrant social life.

D. **Encourage open and evidence-based discussions** among healthcare professionals, researchers, and regulatory bodies regarding the use of generic drugs for early COVID-19 treatment.
E. **Review and revise treatment guidelines** to include early intervention options that have demonstrated safety and efficacy in large populations. Consider the experience of countries that successfully employed such treatments.

F. **Address institutional corruption** by investigating cases of corruption and suppression of early treatments within healthcare institutions and regulatory agencies. Implement measures to ensure transparency and ethical conduct in decision-making.

G. **Support early treatment research** into the efficacy and safety of early treatment options for COVID-19 by allocating resources. Promote collaboration between medical professionals and researchers in this field.

H. **Ensure patients give Informed Consent** for their chosen treatment by discussing all available treatment options, including early interventions.

I. **Establish independent medical advisory committees**, free from conflicts of interest, to assess treatment recommendations and provide guidance to regulatory agencies. Enhance transparency in decision-making.

J. **Promote awareness of vitamin D** and its importance in preventing infectious seasonal diseases, especially during the winter months when vitamin D levels tend to decrease. Encourage further research in this area.

K. **Hold public health agencies accountable** for conducting systematic analyses of peer-reviewed literature on potential treatments. Ensure that decision-making is evidence-based and prioritizes public health over the public health establishment.
7.5.6. Natural Immunity and Early Treatments Rebuffed to Favour Generalized Vaccination

Introduction

One of the most disturbing aspects of the vaccination strategy debacle was the orchestrated propaganda launched early in the pandemic to undermine the well-established foundation of natural immunity and to denigrate early treatments. Generalized vaccination was sponsored as the unique and ultimate solution for the pandemic. This propaganda was propelled by layers of lies.

We were asked to believe that we were facing a new and exceptionally dangerous virus for which natural immunity would fail to protect us, that no viable treatments existed, and that only new wonder vaccines, developed at "warp speed," could save us.

The first issue with this deceptive narrative is that the analysis of all-cause mortality across the world led to the conclusion that a not particularly virulent pathogen was in circulation. The pandemic was declared as a red flag signal for danger with fairly tenuous infection morbidity and fatality case numbers. When one considered the real prevalence of SARS-CoV-2 infection, it had been grossly underestimated, as was typically the case in early days of any pandemic declaration. This was mainly attributable to a vast underestimation of the true infection rate, understandable when infections were often asymptomatic or pauci-symptomatic (presenting few symptoms).

There was no need to contain this new virus by any extraordinary health measures. Normal personal hygiene and well-established public health protocols targeting the protection of the most vulnerable in an adequately protected environment were sufficient.

Whether the population had much higher preexisting immunity to this new coronavirus than reported or the virus was not as lethal as initially broadcast, conclusions from many studies, even early on, indicated a fatality rate in the same range as severe flu seasons, for which no overall excess deaths are discernible except for the elderly population. But clearly, public health authorities couldn’t claim, on the one hand, that there was a serious pandemic of global concern and, on the other hand, say, “Don’t worry. It’s going to be business as usual. Be prudent, self-isolate when you are sick, and do not panic. Stress is bad for your immune system, which is the best line of defence against any potential infection, or cancer.”

Rather, public health authorities had to be perceived as saviours, in full control of what needed to be done in circumstances they declared as dire, and they did it in unison with the same pre-formatted messages in their fear campaign.

Even if, hypothetically, there was a strong case for vaccination to control a putative deadly virus, we should have acknowledged that for this type of virus in the family of coronaviruses, we have never been able to develop an effective vaccine, either for humans or animals. Typically, the genetic variability of coronaviruses based on RNA genomes confers only partial immunization. We have experienced this firsthand, suffering with recurring colds from the four endemic coronaviruses in the human population. Many expert virologists and vaccinologists knew that, but their voices were either silenced or dismissed.
We were also asked to believe that our scientific and technology progress enabled us to quickly develop a new generation of vaccines based on gene therapy technology that would be safe, effective, and readily produced on a commercial scale.

In reality, the support for these false hopes was on very shaky scientific and technological foundations. Nothing in the proposed gene-based vaccines was going to meaningfully address the shortcomings of natural immunity—for example, the recurrent infections, although of less severity, with variants in the coronavirus family. To make matters worse, the selection of the spike protein as the preferred viral antigen disregarded the known biological toxicity of this protein. Its uncontrolled production throughout the human body led to countless vaccine adverse reactions that became the object of intensive investigations.

Another problem is the known facilitating epitopes in the spike protein. These epitopes were known to likely trigger the production of antibodies that would make the infection worse. Also, the epitopes that were shared with human proteins ended up generating countless autoimmune diseases.

As for the rapid production of the gene therapy vaccines, the process for the adenovirus-based vaccines was fairly well-established by decades of research and clinical trials in gene therapy. However, early on, the adenovirus-based vaccines displayed significant toxicities, leading to their withdrawal in many countries.

By contrast, the mRNA lipid nanoparticle (LNP) vaccines had never been scaled-up, posing a significant challenge for their mass production, which continued to be plagued by many manufacturing issues.

We were also misled to believe that there were no possible treatments, a *sine qua non* condition to pave the way to the emergency-use authorization (EUA) of vaccines and unproven, patented, poorly tested antivirals, such as remdesivir, that ended up doing more harm than good. We already knew the SARS-CoV-2 virus shared extensive homology with other coronaviruses. Therefore, partial cross-immunity stemming from previous infections with other coronaviruses was likely.

Also, early studies based on generic molecules to treat the closely related SARS-CoV-1 had already established their potential treatment—HCQ, for example—to be effective against SARS-CoV-1 infection. Notably, all countries that made wide use of these generic drugs displayed a much better performance in controlling the COVID-19 pandemic.

This COVID-19 Virus is Novel, Very Dangerous, and Not Treatable
The message hammered home in the media was that there was no preexisting immunity in the population, that everybody was equally susceptible to serious illness and death following infection, and that we should, at all costs, prevent infection and transmission until a vaccine was available to confer protection. All of the NPIs were therefore deployed to control the spread of the virus until we could all get adequately protected by the COVID-19 vaccine.
Consequently, a surreal “COVID-zero“ policy was aggressively promoted in many “democratic“ countries—in the footsteps of the authoritarian CCP policies in China. The policy was promoted by the baseless allegation that this new public health policy would be successful if only we implemented it hard enough.

This fantasy was based on glaring ignorance or, at best, serious confusion of the functioning of the immune system, as well as the poorly understood theory of respiratory virus transmission. The immune system has evolved to respond to an almost infinite number of pathogens and is exquisitely adapted to respond effectively, in the vast majority of the cases, with every first encounter with any pathogen from the moment we are born. The first line of defence for a respiratory virus is the mucosal innate immunity. That eventually builds up a stronger adaptive response once mucosal IgAs (immunoglobulin A) targeting the pathogen help neutralize it.

As for suppressing the transmission of respiratory viruses, nothing short of the strict confinement in a BSL-4 (bio safety lab) laboratory works. That level of confinement, however, is impossible to implement in real-world settings. Most of the NPIs are, at best, delusional.

Furthermore, serological data proved the presence of the SARS-CoV-2 virus as early as the end of summer of 2019 without any clear indication of massive infection, morbidity, and mortality. The virus was running in the population at least nine months before the declaration of the pandemic, and as a result, a significant proportion of the population had already been naturally immunized without significant signs of the COVID-19 disease.

Throughout the pandemic saga, we were deceived countless times by a “scientific consensus“ that was created by silencing dissenting voices questioning the hegemonic narrative. In the absence of healthy debates, a so-called consensus was only an indisputable dogma, and therefore unscientific.

There is, however, a scientific consensus to the effect that for the hundreds of putative pathogens we are exposed to, the immune system, innate and acquired, protect the vast majority of individuals rather well and for a long time. One notable and exceedingly rare exception was HIV infection, which could destroy our immune defences. But this was clearly not the case with SARS-CoV-2 or the other natural coronaviruses. Doubting this scientific consensus was like doubting the law of gravitational force.

Good health is dependent on a strong and resilient natural immune system, referred to as the terrain. It included a healthy microbiota, which plays a crucial role in educating the immune system. The optimal functioning of the natural immune system is empowered by a host of good habits like real food consumption with fibres essential for a healthy microbiota, vitamins and other supplements, sufficient sleep, nourishing social bonds, regular exercise, and stress-reduction practices. It is nothing new for populations that have shown remarkable longevity over the centuries.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Strangely, many of these healthy lifestyle habits were either suppressed or compromised by fiat. Instead, public health focused obsessively on avoiding COVID-19 by controlling transmission of the virus, ignoring the crucial importance of the terrain. This obsessive focus restricted the goal of public health to the avoidance of only one putative pathogen.

The epidemiological data spoke volumes. Heathy individuals were only mildly affected by the SARS-CoV-2 infection, and most infections were asymptomatic.

Given the futility and harmfulness of most NPIs, letting the virus run in the general population of low-risk individuals while protecting the most fragile should have been the preferred approach to build the so-called herd immunity, which was one of the best ramparts for the most vulnerable. That approach was taken in Sweden and many other countries that did not mandate NPIs.

Besides, a host of treatments and vitamins were available for those whose bodies were not strong enough to combat the infection. Sadly, these treatments were disqualified as “useless” by health authorities in many Western countries, like Canada. Fortunately, they were available for the most vulnerable during the course of the pandemic and were successfully deployed in many poor countries and in a limited number of hubs in Western countries.

New Gene Therapy Vaccines: Better Than Traditional Vaccines?

Knowing that traditional vaccines had failed at providing protection against coronaviruses, hype was generated around a new platform of mRNA genetic vaccines never shown to be successful for any infectious diseases. The promise of these genetic vaccines was, among other things, that they could be manufactured much faster and could therefore be more readily adapted to the ever-evolving variants of SARS-CoV-2 that could escape vaccine-induced immunity.

There are several misconceptions with that premise. Importantly, the promise of the wonder vaccines to end the pandemic was based on three interrelated lies. The first lie was that those so-called vaccines were sterilizing, preventing infection and transmission. This was impossible to begin with, but a well-funded propaganda campaign got the population to believe it. The mantras were incessant: “Nobody is safe until everybody is safe.” “To be safe, you must be vaccinated to protect yourself and others.” “This is a pandemic of the unvaccinated.”

Nothing was further from the truth. The selective pressure imposed by these non-sterilizing subunit vaccines was, fostering a selective milieu favourable for the selection of new variants escaping the suboptimal vaccine immunity—constantly promoting the emergence of new variants of concern. From the perspective of the pandemic dynamic, it is more accurate to describe it as a pandemic of the vaccinated.

The second lie was, we were promised that with the prowess of gene therapy technology and fuelled by very large financial resources, we could make available successful vaccine candidates in record time, at “warp speed,” without compromising the quality and safety of the products. We were told that we should focus primarily on vaccination. Natural immunity was fraudulently portrayed as much less protective.
A third essential lie was the misnaming of gene therapy-based products as vaccines. From a marketing point of view, the most important reasons to mislabel the mRNA gene therapy products as vaccines were (1) to facilitate public acceptance of the products (as traditional vaccines generally benefited from a positive reputation), and (2) to expedite regulatory approval by skipping the tedious and long-term studies of genotoxicity, tumorigenicity and autoimmunogenicity, which are mandatory for gene therapy products.

Thirdly, the mRNA vaccine platform offered the prospect of rapid vaccine production to catch up with the ever-mutating coronavirus variants that escaped immune protection, which had made it so challenging in the past to produce an effective vaccine.

In theory, it looked like a good idea, but in practice, it had several flaws. One was the assumption that mRNA manufacturing was so much faster than the manufacturing of traditional vaccines: new mRNA vaccines for the variant du jour could be made available more readily. However, this would have been a reasonable assumption only if robust current good manufacturing practices (cGMP) were in place for mRNA vaccines, better than for the other vaccine platforms. This was not the case, as was evident by the numerous quality issues with truncated spike mRNA sequences, plasmid DNA contamination, and sourcing of low-toxicity cGMP-grade (good manufacturing practice) lipids for the formulation of the LNPs (lipid nanoparticles).

Many unresolved quality issues were tolerated by regulatory agencies under the pretext of the alleged emergency. The result was batch variations that were far above the acceptable threshold of injectable products. The magnitude of the issues was difficult to formally assess as it had not been opened to systematic, transparent, and independent analysis.

This rapid scheme of vaccine production also required that the relevant “optimal sequence” for the next vaccine could be identified in a timely fashion. This was, at best, a big gamble with our current knowledge of coronavirus biology and epidemiology. By the time the sequence was selected for mass production and deployed, it was entirely possible that a new dominant variant would be so different that matching the vaccine to the variant in circulation would be suboptimal. It was a futile exercise of chasing a moving target.

Furthermore, this idealized scheme assumed, without documentation, that the new sequence would not affect the overall manufacturing process and safety profile of the new product. This was a leap of faith that was not compliant with a rigorous approval process, at least in the modus operandi of the legacy regulatory agency.

Another crucial issue with the mRNA platform was that neither the dose nor the bio-distribution of the viral antigen ultimately produced in people could be controlled. This was in contrast to traditional vaccines based on inactivated pathogens, as well as current recombinant protein-based vaccines like the COVID-19 NovoVax for genetic vaccines. That mattered a lot because we knew that overdose and/or inappropriate site of expression of the viral antigen could lead to many adverse events not observed with traditional vaccines.
It was well acknowledged that ectopic expression of the spike protein in the heart was responsible for a large number of cases of myocarditis and pericarditis with high morbidity and mortality outcomes, much higher than traditional vaccines. Furthermore, long-term side effects, most likely of autoimmune etiology, were manifested in countless neuropathies, like Bell’s palsy and menstrual dysregulation, and the list side effects are constantly growing.

Also, preliminary epidemiological data point to an alarming increase of cancers reappearing after remission, new types of cancers, and fulgurant cancers (or “turbo-cancers”). Even if the causal link with the mRNA vaccines needs to be more formally established, many possible mechanisms have been postulated to support the hypothesis of cancer induction. These genetic injections also perturb the usual immune response and could therefore hamper the ability of the immune system to combat other infections—especially with latent viruses—or keep cancers under control.

The perturbation of the immune system is observable both in the increased COVID-19 infection rate in the weeks following the injections and the propensity for increased infections with an increasing number of doses.

Several features of the mRNA platform potentially contribute to the innate immune system suppression brought about by the reduction of interferon production, which plays a central role in the control of viral infections and further stimulation of the adaptive immune response. For example, the codon optimization done for improved protein production resulted in the generation of secondary structures of mRNA called G-quadruplexes.

Also, a massive concentration of pseudouridine was incorporated to extend the half-life of the mRNA and to prolong its expression over weeks or months. This pseudouridine contributed to higher spike production, several orders of magnitude higher than natural infection. Together, these features of the synthetic mRNA contribute to reduced interferon production and suppress the innate immune response, at least temporarily, with a host of unknown consequences.

Even if it’s been observed that repeated doses of injection increased the titer of antibodies (IgGs) binding the spike protein, the direct demonstration that more IgGs resulted in better protection was lacking. Clearly, it was not only a matter of the amount of IgG but also of binding quality or type of IgG, not to mention the essential contribution of cellular immunity, which was often overlooked.

Alarming concentrations of IgG4 have been measured in people after the third and fourth dose of injection. IgG4 has been associated with making the immune system tolerant to a given antigen, in this case the spike, as we see in protocols designed to reduce allergic reaction by repeated injection of an allergen. This could partly explain why people became more susceptible to COVID-19 infection following repeated injections of mRNA LNPs. Also troubling is the observation that the class switch from IgG1 and IgG3 to IgG4 is associated with higher incidence of aggressive cancers. Given the well-known role of IgG4 in cancer progression by immune tolerance, these observations warrant serious further investigation.
Finally, the entire concept of subunit vaccines depended on selecting the proper target antigen with the right balance of optimal immune induction that causes minimal toxicity. No significant study had been done to support the contention that the spike protein was the ideal target. Given the known toxicity of the spike protein, the rationale of this choice is questionable.

Avoiding most of the short- and long-term side effects would have been possible with the use of traditional vaccines. When evidence was lacking for selecting an optimal target antigen for a subunit vaccine and the safety and efficacy and cGMP production of an unproven vaccine platform were uncertain, it was much wiser to rely on an established technology like inactivated viruses produced in a well-established, large-scale cell culture platform. This was done by the Chinese company SinoVac. Their vaccine was ready at about the same time and was deployed in China as well as many other countries. Whether it was ultimately better than the mRNA vaccines remains to be studied more thoroughly. In any case, it demonstrated that the speed of development and production rivalled the mRNA platform, with much less uncertainty about the safety profile because it was based on a technology with a long track record.

Mass Vaccination to Reach Herd Immunity?
Some scientists and doctors claimed that mass vaccination, whether with traditional or subunit genetic vaccines, would restrict the chance of variants emerging by reducing the viral load sufficiently that the population of viruses would be so small that the probability of variants emerging would be practically nil. This hypothesis suffered from several serious conceptual shortcomings.

It’s rather the opposite that was likely happening. We saw vaccine-immune escape variants flourishing in highly vaccinated countries, extending the infection waves long past the time the infection was mostly over in low-vaccinated countries, such as in Africa. Several experienced vaccinologists argued that it was unwise to mass vaccinate during a pandemic, especially with a non-sterilizing subunit vaccine, but their advice fell on deaf ears.

Hypothetically, even if the vaccines prevented transmission and even if we vaccinated 100 per cent of the human population, many animal reservoirs could serve as hosts to incubate the evolution of new variants. For example, new variants emerged from mink farms in Denmark and France and led to waves of localized outbreaks. Pursuing the fantasy of global vaccination to control the pandemic was scientifically baseless and absurd.

Any vaccine strategy is based on the concept that our immune system, after a primary infection, develops an effective response against re-exposure to a pathogen, thus preventing us from becoming ill again. For serious infectious diseases, a good vaccine would protect against infection and transmission (sterilizing) and against serious illness, thus preventing severe symptoms and deaths. It would therefore be prophylactic, as it could prevent us from getting sick following the first exposure to the pathogen.
Several but not all vaccines in our arsenal exhibit this profile. Those for influenza have fairly low relative efficacy that varies with seasonal strains. Either way, the best we could hope for from a vaccine is to rival the protection of natural immunity without the drawbacks associated with natural infection. This is really the level to reach, and there was no evidence that we had managed to do better.

For respiratory viruses, natural infection effectively protects against reinfection by stimulating local mucosal immunity. Without this robust mucosal immunity, featuring IgAs as one important component, neither infection nor transmission can be prevented. Those who doubted that the most widely deployed COVID-19 subunit genetic vaccines did not protect against infection or transmission needed only to look at the data on infections around the world. The most vaccinated places were also the places where the highest incidence rates of COVID-19 were observed. Conversely, it was particularly striking to observe what was happening in Africa, which had much lower incidence rates despite the lowest vaccination rate (7%), ten times less than the continents more vaccinated. Undoubtedly, many factors contributed to Africa’s good performance in managing COVID-19, but vaccination was not one of them.

One couldn’t block the replication of a respiratory virus, such as SARS-CoV-2, unless one induced local mucosal immunity in the respiratory tract, which couldn’t be done by injecting a vaccine into the muscle of the patient’s shoulder. It was for this reason that among the approximately 143 COVID-19 genetic vaccines in clinical trials, several were being evaluated for nasal administration. One of these vaccines, developed by the Chinese company CanSino Biologics, had been approved for nasal administration and was planned to be deployed in China. In any case, if the name of the game, for whatever reasons, was to prevent SARS-CoV-2 infection to avoid the most deleterious effects from the infection, all of the COVID-19 genetic vaccines in use were unable to do that.

Therefore, in addition to the unavoidable risk of vaccine-induced adverse effects, they mostly failed to protect from the pathologies associated with the course of an untreated infection, assuming that the individual had generated an adequate immune response to begin with. Indeed, there had been reports of obese individuals who became fairly sick from COVID-19 in spite of having a fairly high level of neutralizing antibodies against the vaccine spike protein. Presumably, factors such as the optimal diversity of gut microbiota and robust cellular immunity were not at play in those individuals.

As we have seen from the data in clinical trials, no attempt was made to test the reduction of transmission, so this contention was not based on the highest criteria of scientific evidence, RCTs. The only conclusion presented from the Pfizer RCT was that these genetic vaccines reduced the occurrence of symptomatic infections, not transmission or severe forms of COVID-19. Symptomatic infections were at an absolute risk reduction of about 1 per cent. This anemic absolute risk reduction was due to the fairly low number of infection cases registered during the course of the clinical trial.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The absolute risk reduction, which should have been reported, but was glossed over in the marketing materials, was much less impressive than the widely reported relative reduction of 95 per cent and, at the very least, should have raised questions about the seriousness of SARS-CoV-2 infection cases in the midst of an alleged grave pandemic.

The evidence collected following the deployment of genetic vaccines in the general population also did not support the prevention of transmission, unless the data were manipulated in their collection, attribution, or representation. As for the more severe forms of COVID-19, the evidence for their reduction by genetic vaccines was rather weak to non-existent, particularly since the start of the Omicron wave.

We must also emphasize that the vaccine response decreased significantly over time. The same phenomenon was observed in many states, including Vermont, the most vaccinated American state, which reported higher infection rates than in the past, and Gibraltar, which had one of the most vaccinated populations. Even with the third dose, Gibraltar experienced a strong surge of positive cases but with a relatively lower morbidity and mortality.

As for the real-world data that provided the initial impression that infection and transmission were reduced following vaccination, many confounding factors could have distorted the picture. One important factor was statistical biases. We know that the false impression of reduction in transmission was mostly statistical illusions.

It was created by the arbitrary attribution of COVID-19 infections of the injected individuals labelled as unvaccinated for the first 14–21 days post injection, depending on the states. A simple delay in tabulation of COVID-19 cases of 14–21 days could create the statistical illusion. Interestingly, the Pfizer files obtained by court order revealed that a third of the adverse reactions after vaccination were COVID-19 infection. The high occurrence of COVID-19 infection in the first 14 days post injection was corroborated by data from health agencies in Alberta and Ontario.

That the COVID-19 genetic vaccines didn’t prevent infection and transmission was no longer disputed in the Omicron phase because the high rate of infection made it impossible to claim any reduction of transmission. But it was also already apparent with the countless so-called “breakthrough infections” during the Delta wave in the summer of 2021. We learned, through a FOIA (Freedom of Information Act), that the CDC (Centers for Disease Control and Prevention), the NIH (National Institutes of Health), and probably the FDA (Food and Drug Administration) were aware of these breakthrough infections as early as January 2021, most likely from the Pfizer real-world data.

Examining the data from the Canadian government’s website, the confusion about the effectiveness of genetic vaccines was understandable. Indeed, several official government data sites reported the figures in a way that left the impression that vaccination had prevented COVID cases (and therefore the transmission) or, at the very least, the more serious symptoms leading to hospitalization or death.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Even if we accepted the dubious attribution of exaggerated cases by overcycled RT-PCR tests or that hospitalizations or deaths with COVID-19 were really caused by COVID-19, a more appropriate representation of official data cast doubt on the merits of the intensive promotion of vaccination. Several tables from the government’s site conveyed the illusion of vaccine efficacy but reported and interpreted data in a misleading way.

The tables failed to consider that (1) the vaccination deployment began at different times, starting from December 2020, and that (2) a valid comparison could not be made by aggregating the unvaccinated and vaccinated populations at the beginning when everyone was unvaccinated. A valid comparison of vaccinated and unvaccinated populations required matching time periods (during which the same variants circulate) and accounting for vaccination status (as multiple doses of genetic vaccines were administered).

When we re-plotted the cases by counting from the start of the declaration of cases with additional doses—for example, from June 5, 2022, instead of the start of the vaccination campaign (December 14, 2020)—we observed that people with three and four doses had more COVID-19 cases (and deaths) than unvaccinated people and people with only two doses. Again, the biased PHAC (Public Health Agency of Canada) report suggested the opposite: that more doses conferred greater protection.

It got worse over time as the rate of people recovering from a previous infection constantly increased. The fact that natural immunity was superior to vaccine-induced immunity was a major confounding factor that made the assessment of potential vaccine efficacy futile unless people were tested systematically for previous infections. Given the evidence, the authorities’ relentless promotion of comprehensive vaccination for everyone was difficult to understand.

Rationale for Vaccination and Challenges to Prove a Positive Vaccine Risk–Benefit

From the get-go, any risk–benefit analysis of lockdowns or COVID-19 vaccines was fatally flawed because it was based on the false premise of an uncontrolled spread of a deadly virus. When the risk of dying from COVID was so low to begin with, how could any measure, whether lockdowns or vaccines, actually protect the general population? The potential benefits barely existed, so the harms were likely excessive.

The first principle of ethical medicine, “First, do no harm,” was flouted. Focused protection, as advocated in the Great Barrington Declaration and as was done in the past, should have been the way to protect the most vulnerable. Strangely, the most appropriate and well-established personal and public health measures were brushed aside, and this cost countless lives. Focused protection would have advocated for targeted vaccination for the population most at risk from COVID-19 complications, assuming that a safe and effective vaccine had been available.

Any medical intervention has an intrinsic harm–benefit profile. For vaccines, the safety profile must be paramount because they are administered to healthy individuals. Vaccine-induced adverse effects had been documented for decades prior to COVID and were deemed to be rare.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The potential risks of an unknown vaccine platform and its long-term adverse effects could not be evaluated properly without years of pharmacosurveillance data. That means gambling on a potential positive risk–benefit ratio could only have been advocated to prevent severe diseases and deaths, a concern primarily for the most vulnerable and not for the general population. But vaccination had been pushed with the promise of preventing transmission and reaching the elusive herd immunity that would have put an end to the pandemic more quickly. Measuring potential benefits and risks of vaccination at the individual level is equally challenging on both accounts—of safety and efficacy.

Without a proper harm–benefit analysis, Informed Consent cannot be given. Health authorities lacked the knowledge to conduct a meaningful risk–benefit analysis for vaccination that would consider the profile of each individual. At the very least, people should have been tested for previous infection before vaccinating them. Logistically, this test should not have been more challenging than the pre-vaccine campaign of massive COVID-19 tests and the routine mandatory tests for people refusing the vaccines.

However, such a health measure would have been at odds with the propaganda claiming the inferiority of natural immunity compared to vaccines. Vaccine efficacy had not even been established by formal epidemiological studies. Efficacy had been assessed using an unsubstantiated biomarker proxy of efficacy—monitoring antibody titers.

From a public health perspective, the buildup of natural immunity would have likely outpaced the vaccine deployment to confer protection against severe diseases because most people infected by SARS-CoV-2 were not seriously sick and were even often asymptomatic. That perspective, of course, assumed the vaccines would have conferred protection, a contention which had not been demonstrated.

Importantly, for vaccination to be effective, an individual’s immune system ought to be functioning properly. The conundrum of higher vulnerability to COVID-19, which was going to be remedied by vaccination, is that what makes people more susceptible to the disease is precisely their anemic immune response. That could be based on genetics, with immunodeficiency syndrome, for example, or epigenetic, as a result of poor diet and lack of sleep and exercise, which perturbs the equilibrium of gut microbiota, essential for proper immune homeostasis. In other words, what makes the terrain weak and renders an individual more susceptible to severe disease is not going to be fixed by a vaccine whose mechanism of action requires a good immune terrain to be responsive.

The phenomenon of vaccine non-responders has been widely documented for protein-based vaccines such as the hepatitis B vaccine. Up to 15 per cent are non-responders. It’s noteworthy that healthcare worker mandates for hepatitis B vaccines acknowledge natural immunity, and those who have recovered from hepatitis B are exempted from vaccination if they provide proof of immunity. In an obvious contradiction of immunology science, such exemptions were systematically denied for COVID-19.
It is also well established that immune senescence of the elderly is a major issue for the effectiveness of flu vaccines. Large-scale epidemiological studies would be required to properly ascertain the likely extent to which this problem affected the efficacy of the COVID-19 vaccines. In the absence of such studies, the recommendations of health agencies for general vaccination are, at best, faith-based, not science-based.

The Challenge of Assessing Vaccine Efficacy and Safety

The ultimate test for assessing vaccine efficacy and safety is whether the vaccine protects against deliberate controlled exposure to the disease agent. The test is routinely performed on animals but is considered unethical to perform on humans. Vaccine effectiveness is easier to assess in animals because we can control the infection process by using an inoculum that has been ascertained to make the animals sick 50 per cent of the time. Also, it’s possible to minimize variability of outcomes due to genetic and epigenetic factors by selecting animals with a similar genetic background and putting them in a similar environmental conditions. That avoids the problem of confounding factors.

Even under these ideal conditions, no safe and effective animal coronavirus vaccine has been granted approval for wide distribution, which suggests that the development of safe and effective vaccines for coronaviruses is even more challenging than for other pathogens. Nevertheless, we were asked to believe that the unproven mRNA platform would somehow overcome that biological hurdle.

To minimize the undue influence of confounding factors, randomized controlled trials (RCTs) are the gold standard to assess vaccine efficacy and safety and to establish the risk–benefit profile. Many issues have been raised about the efficacy and safety of all genetic vaccines, but we focused on the analysis of the mRNA platform as it was the most widely deployed.

What the Randomized Controlled Trials Proved and Didn’t Prove

Many issues were highlighted with respect to the quality attributes of the vaccine product, the design of the clinical trials with their selected endpoints, the low level of absolute risk reduction, the irregularities in the execution of the clinical trials, and the underestimation of the vaccine-induced adverse effects. After the systematic suppression of any potential treatments paved the way for the EUA of the genetic vaccines, vaccination was promoted as the only way out the pandemic. It was sold as the way to prevent people from getting infected and seriously sick from COVID-19. It had to be expedited at an unprecedented pace, at warp speed, and against all odds.
Vaccination was going to allegedly protect both individuals and the healthcare system from being overwhelmed. To fulfil these hopes, the RCTs should have been designed with endpoints showing prevention of transmission and severe diseases and death. They were not. Instead, the only endpoint was reduction of RT-PCR confirmed cases with mild symptoms. Surprisingly, 162 RT-PCR positive cases were reported in the placebo group versus eight in the injected group. Although this represented an impressive relative risk reduction (RRR) of 95 per cent, it corresponded to an overall absolute risk reduction (ARR) of less than one per cent. These figures meant that we needed to vaccinate 123 people in order to avoid one infection (defined as RT-PCR positive cases with mild symptoms).

As the occurrence of severe symptoms leading to death was up to 100 to 1000 times lower, depending on the target population, we would have needed to vaccinate up to 123,000 people to avoid one case of severe disease. The RCT, with only about 40,000 participants, was not powered to make that assessment.

It's noteworthy that 170 total cases represented a COVID-19 positivity rate of only 0.004 per cent in six months of follow-up. With this anemic incidence rate, one would have to conclude that the COVID-19 pandemic wave was rather feeble during the RCT or that the testing was not thorough enough. At least, the testing was not as systematic as that which had been deployed to document the worrisome successive COVID-19 waves. Notwithstanding, it's striking that this low incidence rate yielded a very weak overall ARR.

Telling people who are afraid of getting sick with COVID-19 that (1) the mRNA vaccine would reduce their chance to be infected by less than one per cent, (2) it would not stop them from transmitting the virus, and (3) it was not tested for reducing severe disease or death conveyed a very different message than telling them that the mRNA vaccine was 95 per cent effective. By FDA rules, reporting both RRR and ARR was mandatory, but it was conveniently obfuscated. Informed consent was irremediably compromised with their misleading statements. In addition, the validity of vaccine mandates was shown to be baseless.

To make matters worse, mild symptoms like fever, sore throat, and sniffling overlapped with a host of respiratory infections from multiple different viruses or bacteria, which introduced sampling and attribution biases. Those could have been avoided by regularly testing everyone enrolled in the RCT. Instead, the method used to assess the endpoint was fairly limited in detecting COVID-19 cases, and that cast doubt on the soundness of RRR reported in the RCT.

This contention was bolstered by the surprising number of cases that were rejected from the report because of the lack of participant follow-up and the more than 10-fold number of suspected but unconfirmed cases. Indeed, 1594 in the inoculated arm were rejected versus 1816 in the placebo arm, a difference of 222. Also, there was a strikingly disproportionate number of participants excluded from efficacy evaluation for protocol deviations, with 311 in the vaccine arm versus 60 in the placebo arms, a 5-fold difference, or a 251 difference, in the number of participants.
This must be put in perspective when you consider the difference in the calculation of RRR versus the calculation of ARR. In a thought experiment, if one adds all of the confirmed and suspected cases, the RRR was only 19 per cent, much lower than the threshold of 50 per cent set by the FDA for the approval of the vaccine under EUA. Failure to systematically test all participants without subjective attribution of who needed to be tested or not, raised suspicion about the validity of the reported efficacy.

The massive RT-PCR testing on the population generated the waves of positive cases, most of which were asymptomatic, and created the illusion of asymptomatic transmission. This was the real-world proof that this kind of testing could have been deployed during the RCT to avoid attribution biases. Using a different methodologies to monitor vaccine efficacy and epidemic waves was a clear demonstration of a double standard, insofar as testing of asymptomatic people was mandatory in many settings—for travellers; unvaccinated healthcare workers, even those working remotely; and children in schools, where a few positive cases had been detected.

Furthermore, although not reported in the publication describing the result of the RCT, a different way of monitoring SARS-CoV-2 infection was also measured during the RCT, but it was only revealed by documents obtained by a court order. This other method was to test for antibodies binding to at least one of the viral proteins, such as the nucleocapsid protein N, as irrefutable proof of infection. If the RRR is calculated based on seropositivity to the N protein, the RRR in vaccine efficacy was 55 per cent instead of 95 per cent.

But even that assessment was overestimated. A large-scale clinical trial on more than 4000 people established that the seropositivity focusing on only the N protein underestimated the true infection rate (as measured by antibodies against all of the other viral proteins) by a factor of about two. That meant that during the Pfizer RCT, the real RRR was probably in the range of about 25 per cent—again, much lower than the threshold of 50 per cent set by the FDA for the approval of the vaccine under EUA. Pfizer was aware of that, or should have been, before the deployment of their vaccine in the population, but they concealed the information.

Lastly, another systematic bias in the assessment of vaccine efficacy was the time frame selected to monitor its efficacy. Given that COVID-19 infection rates had been demonstrated to be higher for the first few days after the injection, if “protection” was only monitored seven days after the second dose and the window of negative efficacy was not considered, the true picture of vaccine efficacy would be distorted.

As shown in the Pfizer documents obtained by a court order, while Pfizer and the FDA had hoped to keep the information confidential for 75 years, the third most frequent adverse effect observed in the first weeks following the injection was COVID-19 infection. Therefore, Pfizer was aware of this increased sensitivity to infection, a window of negative vaccine efficacy, in the first months of vaccine deployment.
Also, if after the peak in neutralizing antibodies, a constant decline occurred until the protection vanished and this was not properly monitored, a distorted report of vaccine efficacy would result. The waning protection would have called for repeated boosters, and this had been obfuscated.

Assuming, without evidence, that neutralizing antibodies to the vaccine spike would be a valid proxy of protection, monitoring the antibody response on a relatively short time frame could have led to a misrepresentation of the perceived vaccine benefit.

Incidentally, there has been a strange paucity of testing of neutralizing antibodies in the course of the RCT. They were monitored two months after the second dose and again at six months. The absence of systematic measures of antibody titers during the two-to-six-month interval precluded a proper assessment of the rate of antibody reduction as a proxy for waning vaccine protection—important information that could have contextualized the real efficacy of the vaccines over time. For most people, vaccines are expected to last for several years, not a few months.

Even more worrisome is that according to independent experts in clinical trial standard operating protocols (which are strictly regulated by ICH (The International Council for Harmonization) guidelines, followed by industry, and overseen by regulatory agencies), several irregularities had been communicated to authorities by whistleblowers and were ignored.

The first notable one about irregularities, denounced by Brook Jackson, from the contract research organization Ventavia, was commented on in the British Medical Journal. Not only were the issues raised by Jackson completely ignored by Ventavia, Pfizer, and the FDA, but she was also fired for raising troubling questions. At the time of this report, her allegations were being disputed in court.

There is also the widely publicized case of the vaccine-injured Maddie de Garay in the RCT, whose gravity of injury was not properly acknowledged—a clear breach of clinical practice protocol. A similar situation happened in Argentina at the unique, large clinical trial site managed by the military. Out of the 5700 enrolled participants, one participant, Augusto Roux, developed severe myocarditis and almost died during the RCT, yet this event was not reported. He was suing for fraud.

Collectively, all of these five clinical trial sites (three for Ventavia) enrolled over 7000 participants whose data integrity should be evaluated by proper audits that have not yet taken place.

Some commentators dismissed those problems by suggesting that even if we removed these sites from the trial report, which had not yet been done by Pfizer, the data would still support a highly positive RRR number. This is questionable. Removing more than 7000 participants from an RCT of about 42,000 in which 3410 participants had already been discounted would bring the number down to about 32,000 participants. That may or may not challenge the statistical significance of the results or the overall result of the RRR assessment.
Nevertheless, in spite of the speculative nature of these suspicions, there was enough of a smoking gun to justify a formal audit to ascertain whether or not these allegations of clinical trial malpractice were founded. A confirmation by an independent audit would compromise the validity of the whole RCT.

How plausible was it that Pfizer had not been honest? Since 1995, Pfizer had been fined in 40 court cases for 6.5 billion dollars of compensation—for scientific fraud, wild RCTs, corruption of decision-makers, and diffusion of false information. The pattern was well-established.

**Current Good Manufacturing Process (cGMP), Chief Manufacturing Issues**

Another troubling issue was the quality of the vaccine product. It had been questioned by the European Medicines Agency (EMA) when a number of quality attributes did not conform to expected norms. Notably, there was a significant discrepancy in the integrity of the mRNA as well as the degree of DNA contamination between the batches used in the RCT and the commercial batches for worldwide distribution. Even after Pfizer had been notified to fix these issues, they were unable to comply. Because of the alleged emergency, the EMA turned a blind eye.

Obviously, the significant discrepancy between the RCT batches and the commercial batches was proof that the manufacturing processes were different, which was acknowledged by Pfizer. This was a clear deviation of both normal clinical trials standard operating procedures and cGMP processes, and it raised major concerns about the batch quality and consistency.

Indeed, in a normal RCT protocol, although tolerated, it’s highly recommended to avoid changing the manufacturing process in the path of moving from preclinical to the various phases of the clinical trials. At the very least, the process must remain the same from phase 3 to commercial manufacturing. Otherwise, a bridging study is needed to validate that the product will behave as it did in the phase 3 trial.

This consistency is even more important for a complex drug product such as these genetic vaccines. Unlike small molecule drugs, which are amenable to full physicochemical characterization, complex biologics such the mRNA genetic vaccines cannot be fully characterized. For such products, the “product is the process.” Changing the process in the course of product development almost guarantees that the product quality will vary unless the new manufacturing process is well mastered, which was far from being the case for the mRNA-LNP products.

Pfizer acknowledged that their process 1, which was hastily developed for the product used in the clinical trials, could not be scaled up to the level required for commercial manufacturing (process 2). They therefore did a small bridging study during the RCT on 250 participants who received the products manufactured using process 2. That meant that almost 90 per cent of the RCT was done with a different product than the one that was used on the general population. Does anyone besides the regulatory agencies think that testing this product in a RCT with only 250 participants would yield reliable, statistically significant data?
The regulatory agencies advertise on their website that they audited the manufacturing batches; however, the reports of such audits are not made public. It’s therefore unclear to what extent the batch quality issues are limited or widespread.

Independent analyses by several experts have revealed that the issues of RNA integrity and DNA contamination have persisted in many batches. Most notably, functional plasmid DNA harbouring antibiotic-resistant genes as well as the SV40 strong promoter sequence have been detected at more than 10-fold the level of the acceptable norm. Both the short- and long-term consequences of the poor batch quality have not yet been fully examined.

One big concern is that, unlike mRNA, DNA can integrate in the cell genome without the step of reverse transcription, so this event could occur at a higher frequency. Also, the SV40 strong promoter sequence, once integrated, could activate distant genes and perturb normal gene expression in unknown ways. Only rigorous genotoxicity and tumorigenicity analyses could determine the long-term consequences of such events. Such studies have been waived, so we are left to just hope for the best.

The complacency of the health authorities does not augur well for redressing the pitfalls of the cGMP issues that they have been so far reluctant to require to get resolved. This was further exacerbated by the silent approval of new bivalent mRNA vaccines that use the same suboptimal manufacturing process. There is no COVID in which changing the RNA sequence is not a minor modification with untold and unexamined consequences. How can we conclude that changing the RNA sequence is a minor modification without assessing it with RCTs (which have been deemed unnecessary)?

Despite what has been claimed by governments and echoed in the mainstream media, corners have been cut, and the trend has been worsening. How can any health regulatory agency endorse the alleged safety and efficacy label of a product with questionable quality and consistency and in blatant contraventions of quality standards established in the industry for decades? Perhaps that is part of the new normal—regulatory bodies no longer enforcing the high-quality standards essential for public safety and endorsing an accelerated process development and approval cycle. If it is justified by an emergency, what is the emergency?

Underestimation of Vaccine-Induced Harms

Underestimating the occurrence and hazards of vaccine adverse reactions has been the modus operandi of the Pharma industry in concert with public health authorities for decades. This was done under the guise of the greater good to suppress vaccine hesitancy at all costs and to promote vaccination as widely as possible as an indisputably beneficial health measure. And, to that noble end, anything in the play book is acceptable. This includes attacking dissenting voices with derogatory terms among which the label “anti-vax” sits at the pinnacle.
Nothing can be more unscientific than resorting to ad hominem attacks to silence legitimate debate. Sadly, character assassination is not the only tactic. People who dared to question the orthodoxy that controls the granting system, along with the other institutions, have found their scientific careers ruined.

The quasi-religious faith in the virtues of vaccination undermines any decent assessment of its risk-benefit ratio. As vaccines are presumed to be safe and effective without rigorous testing, vaccine safety research is impeded by the lack of granting support, unlike the well-funded field of vaccine development, hence the paucity of vaccine safety studies.

An honest risk-benefit assessment of the mRNA genetic vaccine was plagued by bias measures that tended to amplify merits while downplaying adverse effects. Any positive risk-benefit analysis was so questionable that thousands of doctors and scientists across the world joined their voices to call for an immediate suspension of COVID-19 genetic vaccines until a proper risk-benefit assessment was conducted.

In the absence of solid evidence from RCTs, the opinion of health authorities relied on real-world data whose completeness and accuracies were questionable. It was more a matter of expert opinion than hard scientific evidence.

High-profile medical and scientific experts without conflicts of interest examined the data and concluded that these mRNA-LNP genetic vaccines are neither safe nor effective. The same data was examined by medical authorities and government officials in Canada and across the world who trusted the “safety and efficacy” narrative without reliable data from the Pharma companies. Who were more credible?

At the time of writing this report, some COVID-19 genetic vaccines had been restricted in a limited number of states for unfavourable risk-benefit profiles in some segments of the population, mostly younger people. Citizens were calling for a more complete ban on COVID-19 mRNA vaccines, whereas the adenovirus-based vaccines were no longer on offer in many countries, including Canada.

It was an uphill battle. Meanwhile, the FDA was examining which sequence of Omicron variant to offer for the fall booster as the original Wuhan and bivalent vaccines were no longer promoted. In Canada, the National Advisory Committee for Immunization (NACI), whose members were as plagued by conflicts of interest as the FDA panel members, were following along the same lines as the FDA. Their implicit message was that the only problem with the mRNA-LNP products was matching the sequence of RNA with the variant du jour.
In Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

In spite of all the attempts to minimize the extent of the mRNA genetic vaccine adverse reactions, the acknowledgment of severe symptoms and the unprecedented death rate was growing. Were the high number and diversity of vaccine adverse events (VAEs) a big surprise? Not really, insofar as most of the potential adverse events to be monitored were listed on the FDA website in October 2020, and they were what we observed after the vaccine deployment: myocarditis, pericarditis, thrombosis, autoimmune diseases, and a host of invalidating neurological conditions.

These were also spelled out in the record of the Pfizer documents, obtained by court order. Pfizer’s post-marketing pharmacovigilance study showed an impressive number of serious adverse reactions in the first months of vaccination, including more than 1200 deaths. Contrast that with the flu vaccination campaign of 1976, which was suspended after fewer than 100 deaths. The precautionary principle was still in effect at that time.

In retrospect, there were some glimpses of severe adverse effects from the Pfizer RCT, even though the formal assessment of long-term adverse reactions was abruptly interrupted during the course of the RCT. An astonishing decision to offer the vaccine to the placebo arms interfered with one of the trial’s important objective of assessing long-term safety. Vaccinating the placebo arms after six months in the course of the RCT effectively eliminated most of the placebo arm control that would have allowed us to compare the occurrence of adverse effects for the two-year duration initially planned.

However, all of the data at the six-month interval pointed to significantly higher illness, which the vaccine was supposed to reduce. What good was a vaccine that reduced the infection cases without any indication of reducing the illness?

Although not statistically significant, it’s noteworthy that there were more deaths in the vaccine arms than the placebo arm, 20 versus 14. Interestingly, cardiovascular events were the cause of nine of those deaths in the vaccine arm and five in the placebo arm. Given the context that myocarditis and pericarditis were among the first vaccine severe adverse effects (VAEs) acknowledged by health authorities, this confirmed the importance of such cardiovascular events. In any case, even if the analysis was deemed not statistically significant, with such data, any claim of vaccination reducing illness and death was unsubstantiated by the RCT.

More telling was what was not reported or even examined. Given that clear symptoms were the endpoints of the pathological process, it was routine medical practice to assess the early signs of pathologies using validated biomarkers. It was mind-boggling that standard biomarkers had not been deployed to monitor the myriad of expected potential side effects listed by the FDA. For example, D-dimer provides evidence of enhanced coagulation/clotting, C-reactive protein for evidence of enhanced inflammation, and troponins for evidence of cardiac damage. If biomarkers of early signs of disease are not tracked, then biosafety monitoring is of poor quality. Consequently, the assessment of vaccine safety is far from exhaustive.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

From Anecdotal to Large Statistics of All-Cause Disability and Mortality

Besides the astonishing lack of acknowledgment of vaccine-injured people, the cruelest aspect was the gaslighting. How can one listen to the horror stories of people whose lives have been destroyed by vaccine injuries without being moved and shocked by the wall of indifference, or even hostility, that they had to face while desperately attempting to be heard by medical authorities?

Even more frightening was the apparent incapacity to properly diagnose the myriad of symptoms, many of which were rare or never seen before. This attitude provided little hope that treatments would be proposed for injuries that were not properly acknowledged.

Many came to share their stories with candour and despair. Although the total number and extent of vaccine-induced disabilities were challenged by the authorities, given that many had taken the injections for the cause or were coerced by social pressure or government mandates, the least that a compassionate society must do is acknowledge them, treat them, and properly compensate them—not leave them to their misery. People were mourning the death of close relatives following the injections with unresolved sentiments of guilt, helplessness, rage, and sorrow of not being recognized by the authorities.

Vaccine-injury denial was part of the propaganda of denigrating people with the anti-vax label in the effort to combat vaccine hesitancy—purportedly dangerous for public health. Vaccine-injury denial has been around for a long time, at least since 1984, but it was on steroids during the COVID-19 health crisis.

Vaccine-injured people are more than just a number in a table of vaccine-correlated symptoms. Beyond the cold statistics, there are humans who suffered twice—first, from their vaccine injuries, and then, from the denial of the authorities and the population to recognize their miserable state.

This denial is being challenged in courts all over the world, and with time, silence will be broken and justice will prevail. Otherwise, we will face another health crisis debacle when the next pandemic is declared.

While the state was diligent in procuring excess stocks of vaccines, which were subsequently destroyed when they expired, or generously given to Africa before they expired, what resources were devoted to dealing with the deleterious consequences of vaccine injuries, in terms of care and compensation disability?

The population had already payed for these free vaccines with their taxes, and they were set up to continue paying on a personal and collective level because the manufacturers had signed contracts exonerating them from prosecution.

If, despite the urgency of the authorization, these vaccines were well designed and manufactured to be safe and effective, why did the manufacturers have to protect themselves from legal prosecutions by passing the bill on to the public, who still has to pay and be further impoverished by the indebtedness of the state?
In the context of strained resources for healthcare, which monopolizes a substantial part of state budgets, one cannot ignore the significant direct and indirect costs of the unjustified massive vaccination campaign. Hasn’t this vaccination campaign resulted in a vast wealth transfer to the pharmaceutical industry? Not only is there no benefit to public health, but we will be paying for the increasingly heavy toll of damages for decades to come.

Due to a toxic combination of willful blindness and collective guilt of the medical establishment that took part in the vaccination campaign and fiercely fought vaccine hesitancy, calling it irresponsible and harmful for public health, the lack of acknowledgment and the gaslighting of the vaccine injured has been a major obstacle to their therapeutic care. From the analysis of the VAEs in the RCTs to the endless lists of injuries reported in the various pharmacosurveillance systems, the alarming number and diversity of disabilities induced by the COVID-19 genetic vaccines are unquestionable.

An independent reanalysis of Pfizer and Moderna RCTs done by Fraiman and collaborators revealed that SAEs (severe adverse events) occurring at a rate of one in 556 is categorized as “uncommon,” according the accepted classification, not “rare,” as was displayed on the various government websites. Since this rate is 18-fold higher than was used in the past for withdrawing other vaccines, why were the COVID-19 genetic vaccines not withdrawn?

Experts monitoring all of the governmental pharmacosurveillance systems worldwide—for example, VAERS in the USA, Yellow Card in UK, EudraVigilance and the WHO VigiBase system—have recorded numbers of injuries, disabilities, and deaths that are more than 20 times higher than for traditional vaccines. There were enough safety signals in VAERS in January 2021—almost 700 deaths—to stop the rollout of the Pfizer vaccines. Based on that, the Moderna vaccines should not have been rolled out. However, all of the historical safety signals for suspending vaccines were ignored.

As a result, countless VAEs piled up for more than two years before the CDC was forced to release the data from their V-safe system. It revealed more than 700 safety signals from over 10 million self-reported VAEs, of which 7.7 per cent were deemed severe adverse events.

It’s noteworthy that both the number and the diversity of VAEs were much higher. The types of VAEs linked to COVID-19 mRNA-LNP were up to 15,042, which is greater than 10 times more diverse than for all other traditional vaccines. This diversity in adverse events was probably liver related. As it turned out, the mRNA-LNP vaccine was very stable and had an ill-defined pharmacodistribution profile. Accumulation of spike proteins in the ovaries was a concern, but the liver was the second site of greatest accumulation after the injection site. Accumulation in the ovaries was likely the reason for the menstrual dysregulation and partly explained the significant reduction in fertility rates in many highly vaccinated countries. It also correlated with increased stillbirth rates.
This increase in stillbirths was documented in a study co-authored by Dr. McCullough in which it was reported that COVID-19 genetic vaccines had a greater than two-fold, or 100 percent increase, in VAEs as compared to traditional flu vaccines. This represented a clear safety signal requiring further investigation, according to the CDC. Furthermore, a major increase in stillbirth rates were observed in many states, correlating with higher vaccination rates of pregnant women.

While the result of the RCT conducted by Pfizer on pregnant women was not disclosed even many months after the trial has been terminated, it’s unfathomable that the vaccines were promoted to pregnant women without any safety or efficacy data. That was in blatant disregard of the precautionary principle. Also unfathomable was the willful blindness of the medical establishment who endorsed it without scientific evidence. Their faith in the Pharma industry and the regulatory agencies was misguided.

It was shown that spike mRNA was persistent in the liver, and liver accumulation is likely the main reason for the diverse pathophysiological symptoms. Among the main physiological systems in the liver, we found a number of proteins involved in the regulation of the ACE2 renin-angiotensin system (RAS), a key system that was most likely disrupted by the spike protein by virtue of its binding to the ACE2 receptor.

Also, the liver was the production centre of many proteins involved in the coagulation cascade; its dysregulation could lead to all kinds of clotting issues. Numerous VAEs had common etiology involving aberrant coagulation and wound healing. Further research is required to decipher the specific mechanisms involved.

Interestingly, the perturbation triggered by spike-induced liver inflammation which affected normal liver coagulation homeostasis, combined with the propensity of the spike protein for aberrant folding, could provide some fertile research hypotheses to explore the underlying mechanisms of the unusual clot formations that has been observed by embalmers.

Ectopic over-expression of the spike protein in other tissues, such as the endothelium of veins and arteries, is likely involved in many coagulation pathologies. Similarly, ectopic over-expression of the spike protein in the brain could be at the root of a host of neurological diseases. Again, this will only be unravelled by much-needed additional research.

Even in the absence of the precise pathophysiological mechanisms of injuries that need to be further investigated for the myriad of VAEs, a significant number of autopsies documented the plausible causal link of the COVID-19 genetic vaccines in many cases of suspicious sudden deaths. The COVID-19 genetic vaccines were also a plausible explanation for the abnormal surge of non-COVID excess deaths in 2022 in most of the highly vaccinated countries, especially noticeable in the younger population.
From the more than 4,300 peer-reviewed papers examining vaccine injuries, a study co-authored by Dr. McCullough found that in the 44 papers describing autopsy reports, 74 per cent of the 325 autopsies were adjudicated to be mostly caused by COVID-19 vaccination. The deaths occurred within a mean average of 14 days of the last injection, with the majority occurring within a week. The close temporal association made the adjudication more plausible. For all of these cases, 53 per cent of the time, cardiac issues were the main cause of death, followed by hematological issues (17 per cent).

The magnitude of death and injuries can be realized from the May 5, 2023, VAERS. It counted more than 1.5 million VAEs, including 35,324 deaths in the U.S. With a conservative under-reporting factor of 20, this represented 706,480 deaths in the U.S. alone, a staggeringly high death toll if proven correct.

In the absence of data transparency—governments refusing to report the vaccination status of people dying of all-causes—it was very difficult to appreciate if vaccinated people were dying proportionally more than unvaccinated people. It was therefore difficult to assess the magnitude of health damages generated by the broad vaccination campaigns.

However, this information was obtained from the analysis of insurance companies and the U.S. Bureau of Labor Statistic (BLS), as testified to by Edward Dowd. Indeed, the careful investigation of the tables led to the disturbing conclusion that in 2021, 2022, and continuing in 2023, it was detrimental to your health to be “employed” in the United States, financial analysts referred to this as a black swan event.

Given that the working population in the U.S. was likely to be the healthiest, finding that they were dying at a higher rate than the unemployed was astonishing. For example, in the third quarter of 2021 (Q3), there was 40 per cent excess mortality in the population aged 25 to 64. To put this in context, a 10 per cent increase in excess mortality was a 1-in-200-year event, hence very rare; a 40 per cent increase was off the charts. And these off-the-chart excess mortality rates happened immediately after the vaccine mandates, which were systematically implemented for every federal government employee and for private companies of more than 100 employees.

The best explanation for such a coincidence is that the vaccine-hesitant millennials were coerced to take the jab or lose their job, and the rapid vaccine uptake resulted in the increase of all-cause mortality in the subsequent quarters. No other event could meaningfully account for that.

Furthermore, the staggering amount of lost work-time data from the BLS showed a huge increase in lost workdays in 2021 and 2022 (due to approximately 26 million vaccine-injured people, when we considered a 30–40 underreporting factor in VAERS): it was another black swan event. This significant disability of almost 10 per cent of the workforce was going to result in major loss of productivity for the U.S. economy in years to come. No one meaningfully challenged the quality of this financial analysis, yet no authority was willing to acknowledge the consequences of this dire situation and propose a remedy.
Finally, because of unavoidable attribution biases, a clear correlation of COVID-19 genetic vaccines and deaths could ultimately be best established by a statistical analysis of all-cause mortality worldwide, as testified by Dr. Denis Rancourt. From his careful and detailed analysis of the statistics on all-cause mortality over a century, by age and discrete temporal categories, he concluded, beyond a shadow of a doubt, that the worldwide vaccination campaigns were responsible for a massive amount of deaths (and still counting).

The first insight about vaccination as the main culprit of an increase in all-cause deaths came from a study in India in which a huge peak of excess deaths (3.7 million) was linked to the vaccine rollout that targeted mainly elderly and frail people in the first wave of vaccination, called the “Vaccine Festival.” As it turned out, the vaccine-dose fatality rate (vDFR), as calculated using a large body of data, was much higher in older people.

The vDFR increases exponentially with age, ranging up to 3 per cent for the most vulnerable elderly, with a doubling time of five years. In the Indian vaccination campaign, the vDFR was, on average, one per cent because of the target population.

The statistics for Australia went from zero excess deaths to a huge excess in deaths immediately following the vaccine rollout. The trend continued and was very visible after the third dose. In Mississippi, the “Vaccine Equity Campaign”—again, for the most vulnerable in the population aged 24 to 65—also yielded a huge excess in deaths immediately following the vaccine rollout. Similar profiles were also easily discernible in Alabama and Michigan.

In Canada, the excess mortality seen in 2020, did not decrease in 2021–22 following vaccination. In fact, in 2022, there was significantly higher mortality than in 2020 or 2021. As soon as the vaccination was rolled out, we saw an extra peak of mortality. The rollout of the third dose gave the highest peak of mortality, suggesting that the toxicity was dose dependent.

The data from many Western countries allowed Dr. Rancourt to calculate a vDRR between 0.05–0.1 per cent and 1 per cent (and up to 3 per cent for the most vulnerable). Excess deaths were 13 million worldwide—3.7 million in India, 330,000 in the USA, and around 28,000 to 31,000 in Canada—for a vDFR of 0.03 per cent or 1 death per 3000 doses. Again, the astonishing numbers of COVID-19 genetic vaccine deaths were not meaningfully challenged.

In most countries, excess mortality was dropping and returning to normal, but there were a few countries like Canada where excess mortality was higher in 2022, and the reason behind this phenomenon was being explored.

**Poor Modelling Says Millions Saved by Mass Vaccination**

As the data on vaccine serious adverse effects piled up, the health authorities reluctantly started to acknowledge their existence. With the growing evidence on causality, they tried to evade responsibility. Their justification went something like this: “Of course, no vaccine is perfectly safe, but causality has not yet been demonstrated in the majority of the cases, and overall, they save many more lives, even if the vaccines, potentially, are causing some deaths.”
The incentive to make such baseless claims was also motivated by the systematic suppression of life-saving treatments, which potentially cost millions of lives. The suppression was a necessary condition to get COVID-19 genetic vaccine approval under EUA.

It would have been possible to conduct rigorous statistical analysis to prove that a reduction in COVID-19 or all-cause mortality following vaccine rollout in 2021 was strongly correlated with the vaccine rollout. The fact that no such study was published by any government in the world was a clear indication that prevention of COVID-19 mortality by vaccination was not observed in the real world.

Ignoring the data, health authorities resorted to “garbage in, garbage out” modelling, like the one published by Neil Ferguson at the beginning of the pandemic that predicted COVID-19 mortality. Due to incorrect assumptions, his model exaggerated deaths by a factor of 10 to 20.

The same playbook was used in the infamous *Lancet* paper that claimed that the COVID-19 genetic vaccines would save up to 14.4 million lives in 2021. This modelling was based on false assumptions about the infection fatality rate (IFR) and vaccine efficacy that resulted in at least a 200-fold overestimation of vaccine’s putative benefit on death reduction. These absurd modelling results were widely publicized in the mainstream media.

Similarly, on paper falsely claimed that Canada’s drastic health measures, in terms of NPIs and vaccination, had a combined benefit of preventing 1.1 million COVID-19 deaths. The figure was produced by massively overestimating IFR and putative effectiveness of both NPIs and vaccines. The claim that those drastic measures brought down the excess-death statistics to exactly the expected historical level was simply absurd, as testified to by Dr. Denis Rancourt. The fact that such a poor-quality paper was published in the peer-reviewed literature was mind-boggling.

**Conclusions**

There was malpractice by public health and individual healthcare practitioners. Relentless vaccination and denial of early outpatient treatment for COVID-19 were rivalled only by bureaucratic stubbornness.

Given the limited evidence-based justification for widespread vaccination and concerns regarding the experimental mRNA-LNP gene therapy injections, we concluded that:

- These injections did not undergo the standard approval process for gene therapy products.
- Manufacturing issues led to quality concerns that deviated from historical regulatory standards for protecting human health.
- The unprecedented level of reported morbidity and mortality, particularly among vulnerable populations, surpassed what was observed with traditional vaccines or COVID-19 infections.
• Rigorous randomized controlled trials (RCTs) failed to demonstrate their efficacy in stopping transmission or reducing severe illness, hospitalization, or death. Instead, the vaccines were associated with more harm than benefit.

• The injections were administered without obtaining free and Informed Consent, contravening the principles of the Nuremberg code.

• During the early days of the pandemic, politicians said that one death from COVID-19 was one too many, implying an all-out war on COVID, regardless of collateral damages. Although they claimed that drastic measures were necessary to prevent COVID-19 deaths, the vaccine-caused deaths were ignored—a double standard at play. Those deaths were tolerated for the “greater good.” Certainly, no effort was made to avoid vaccine deaths at all costs.

In theory, reporting of VAEs was compulsory, but many doctors didn’t report adverse events because the process was cumbersome and because they couldn’t or wouldn’t believe that VAEs were linked to vaccines. However, it was not up to doctors to make the call to skip the reporting process.

The net result of the authorities’ use of inappropriate criteria was a substantial underreporting of side effects. Because the time frame of occurrence was established on the false premise that these genetic vaccines were like traditional vaccines, any side effect reported after a few weeks was arbitrarily deemed unrelated. The estimate was between a 10- to 100-fold underreporting of VAEs.

The decision to suspend a vaccine depended on the danger signals analyzed from VAE statistics. Every VAE had to be analyzed to formally incriminate the vaccine as a causal agent, but the process was long and tedious. Normally, the likelihood of suspending vaccines increased with greater numbers of injuries. During the COVID crisis, however, even though the threshold of danger signals was well above traditional vaccines, the formal process of their removal was not activated, except for some limited restrictions in some states.

Outrageously, the precautionary principle was flouted for pregnant and breastfeeding women. Without any clinical trial safety data, these vaccines were promoted after unsubstantiated data alleged pregnant and breastfeeding women were more at risk from COVID-19 than the general population. The reckless decision to recommend the vaccine to pregnant and breastfeeding women resulted in a notable increase in miscarriages, stillbirths, and serious health problems for babies.

The contention that the COVID-19 genetic vaccines had shown any positive risk-benefit in any segment of the population was refuted by the bulk of the evidence provided by independent expert witnesses. Their overall conclusion was that these genetic vaccines did more harm than good. They remarked on the limited efficacy and imminent danger of these vaccines, and they called for an immediate withdrawal from the market until rigorous studies proved the vaccines were safe and effective.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The onus of proof was seen to be on the vaccine manufacturers. The regulatory agencies were admonished by expert witnesses to get back to the best practices of protecting the public from the harms of a product hastily developed, tested, and manufactured.

Working at “the speed of science” was denounced by expert witnesses. People would be justifiably reluctant to fly in a plane under construction that had not been fully tested for safety. People were similarly justified in their vaccine hesitancy. At best, these mRNA vaccines were poorly tested experimental prototypes that should have been sent back to the drawing board. This was unlikely to happen unless the perverse incentives for these products were eliminated.

Unfortunately, suspending the vaccines would have required government officials to admit their initial reckless mistake. The further they persisted without acknowledging their error, the more they doubled down and pushed the approval of new mRNA formulations without proper RCTs. We saw this with the approval of vaccines for children and the approval of the bivalent Omicron vaccines.

They wanted us to believe that because the initial concoction had been declared safe and effective, the new mRNA sequences in the same LNP platform would also be safe. They were saying, without proof, that new mRNA coding sequences didn’t make any difference. This approach violated the spirit of the historical drug approval process that had been practised for decades (although with some gaps) to protect public safety. A new drug was presumed unsafe and ineffective until proven otherwise, and changing anything in the content of the product made it new.

Recommendations
We recommend the suspension of any further vaccination for COVID-19 until (1) the issues of cGMP production are resolved; (2) the genotoxicity, auto-immunogenicity, and tumorigenicity assays are conducted to the appropriate level for gene therapy products; and (3) rigorous RCTs demonstrate the reduction of morbidity and mortality in a representative population, including the most vulnerable.

Given that there was no efficacy study in the RCT with the mRNA-LNP produced in the commercial manufacturing process and that there were irregularities in the clinical trial process, we recommend that Health Canada require an independent audit of the RCT.

Victims have to be compensated more readily. We also recommend that the government set up a special centre to take care of the vaccine-injured.

Regulatory agencies must revisit the warp-speed-development mindset of the COVID-19 genetic vaccines and rebut the allegation that the mRNA-LNP products have been proven safe and effective and that they can therefore be further used as a vaccine platform for other diseases without proper safety testing.

A Pandora’s box has been opened, and promoting any future products based on that mRNA-LNP platform technology for expedited marketing, within one year, without the proper efficacy and safety assessment will only perpetuate bad health outcomes of similar magnitude.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

In alignment with the views of numerous medical doctors and scientists worldwide, the following recommendations are made:

A. **Immediately halt the use of experimental mRNA-LNP** gene therapy injections for COVID-19 prevention.

B. **Approve any future applications of these injections through** the standard gene therapy product approval process.

C. **Ensure that the regulatory approval process** and recommendations by vaccine immunization committees are reviewed by independent medical and scientific advisory committees without conflicts of interest.

D. **Establish clear safety signal thresholds** that would necessitate the automatic removal of any vaccine or therapeutic product from the market, with legal accountability for officials failing to adhere to these pre-established norms.

E. **Acknowledge, treat, and adequately compensate individuals** who have experienced vaccine-related injuries.
7.5.7. Interim Authorization of COVID-19 Vaccine

Introduction

The Commission received detailed information about the procedure through which “approval” for COVID-19 vaccines was granted in Canada. According to the testimony, the conventional evaluation and endorsement process for the COVID-19 vaccines was not adhered to by the Canadian Government. Instead, a new process was established whereby Health Canada “authorized” the COVID-19 vaccines under an Interim Order (which was later adopted as a permanent regulation). It is important to understand that the COVID-19 vaccines were never approved under the traditional approval process for drugs in Canada. Under the alternative authorization process, the necessity to establish the safety and efficacy of COVID-19 vaccines through an objective manner appears to have been set aside.

Objectively and independently proving the safety and efficacy of any new drug before its introduction into the market is an essential cornerstone of responsible healthcare and public safety. This rigorous requirement serves as a critical safeguard for individuals’ wellbeing, ensuring that potential risks are thoroughly assessed and weighed against the benefits. This principle becomes even more pivotal when the drug is intended for widespread use across all segments of the population.

The blanket use of a drug, especially one like the COVID-19 genetic vaccines, necessitates an unassailable foundation of evidence. Rigorous testing, transparent evaluation, and independent verification of safety and efficacy are fundamental to instilling trust among both healthcare professionals and the general public. This approach ensures that medical interventions are based on the most accurate and reliable information available.

In the context of a global health crisis, these principles are vital to ensuring that public health measures are not only effective but also respectful of individuals’ rights and dignity. It is imperative that all drugs proposed to be released to the public be objectively and independently proven to be both safe and effective. It is for this reason that strict proof of safety and efficacy have been required by our drug approval regulations. The need to prove both safety and efficacy take on particular importance for drugs intended for the entire population, including children and pregnant women. This approach forms the bedrock of responsible medical practice and contributes to a society that values health, science, and the dignity of each person.

Testimony Concerning Interim Authorization of COVID-19 Vaccines

The following vaccines were authorized by Health Canada under the Interim Order:

132 Throughout this Report, the terms approval and authorization are used synonymously to describe the process by which Health Canada made the COVID-19 vaccines available for use in the Canadian population. Health Canada appeared to also use the terms somewhat synonymously; however, the distinction between drug approval under the normal procedures and COVID-19 drug authorization under the Interim Order and the new regulation is discussed in this section.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

1. Pfizer-BioNTech on December 9, 2020, for ages 16 and older and May 5, 2021, for ages 12-15,
2. Moderna on December 23, 2020, for ages 18 and over and August 27, 2021, for ages 12-17,
3. AstraZeneca on February 26, 2021, for ages 18 and older, and
4. Janssen (Johnson & Johnson) on March 5, 2021, for ages 18 and older.

The Commission received testimony from two key witnesses, Shawn Buckley and Deanna McLeod, regarding the procedure through which the authorization of COVID-19 genetic vaccines took place in Canada.

The initial authorization of all COVID-19 vaccines was provided under a temporary Interim Order, which exempted them from the traditional regulations that demand manufacturers demonstrate objective evidence of safety and effectiveness. The result was that while chief medical officers across the country repeatedly assured Canadians that the COVID-19 vaccines were “safe and effective,” the general Canadian population had no understanding that their authorization process had not required objective proof of safety nor efficacy.

Shawn Buckley

A constitutional lawyer, he discussed the changes in Canada’s Food and Drug Regulations for the approval of COVID-19 vaccines.
(Quebec City: May 12, 2023)

The normal regulatory process for approving a new drug in Canada is set out in Division 8 of Canada’s Food and Drug Regulations (the Regulations).133

In order to get approval of a new drug in Canada, the Regulations require evidence of both the drug’s safety and effectiveness to be demonstrated to the Minister of Health.134 Once evidence of safety and efficacy is provided, the Minister considers whether the benefits outweigh the risks. If evidence of safety and effectiveness has been provided which shows that benefits outweigh the risks, the Minister may grant market approval of a new drug.

133 Food and Drug Regulations, C.R.C., c-870.

134 Regulation C.08.002(2)(g) and (h).
These first steps of demonstrating safety and effectiveness, before approval, are essential to ensuring that Canadians are not exposed to unknown risks in the name of unknown effectiveness. The Federal Government’s creation of the Interim Order required Health Canada to approve the COVID-19 vaccines without proof of either safety or of efficacy which resulted in millions of Canadians taking a new drug whose safety and effectiveness could not be known.

The unfortunate result of authorizing the COVID-19 vaccines through the Interim Order (instead of within the traditional approval process under the Regulations) was revealed through NCI testimony—many Canadians were injured or killed while at the same time the COVID-19 vaccine was revealed not to be effective in preventing infection and transmission nor reducing the severity of illness. The benefit of hindsight demonstrates clearly why the traditional tests under the Regulations are needed for all new drug approvals and why Canada should not authorize drugs under Interim Orders, even in cases of public health emergencies.

**The Traditional Drug Approval Process**

The requirements that must be met to approve a new drug in Canada are found in C.08.002(2) of the Regulations. Of particular importance are high requirements for proof of both safety and efficacy. These are found as follows:

C.08.002(2) A new drug submission shall contain sufficient information and material to enable the Minister to assess the safety and effectiveness of the new drug, including the following:

- g) detailed reports of the tests made to establish the safety of the new drug for the purpose and under the conditions of use recommended;
- h) substantial evidence of the clinical effectiveness of the new drug for the purpose and under the conditions of use recommended.

Under the traditional approval process in the Regulations, the first step is to establish the safety profile of the new drug and demonstrate to the Minister of Health that the drug is safe for use in the human population. The second step is to establish the new drug’s benefit profile: in other words, Is it effective? Does it work? The third step, although not specifically included in the Regulations, is to evaluate the risk–benefit profile for the drug. The regulatory review has to establish that the benefits of using the drug outweigh the risks of using the drug.

One cannot satisfy the requirement for a risk–benefit analysis without a complete understanding of the drug’s safety and benefit profile.

**(Interim Order: Importation, Sale, & Advertising of Drugs in Relation to COVID-19)**

Instead of following the Regulations, on September 16, 2021, the Minister of Health made an Interim Order exempting all COVID-19 drugs (including COVID-19 vaccines) from the normal review and approval process.
The Interim Order was made under section 30.1 of the *Food and Drugs Act*, R.S.C., 1985, c. F-27, which permits the Minister of Health to make an interim order that overrides normal regulations. This section reads:

30.1 (1) The Minister may make an interim order that contains any provision that may be contained in a regulation made under this Act if the Minister believes that immediate action is required to deal with a significant risk, direct or indirect, to health, safety, or the environment.

The term *significant risk* is not defined in the Act, nor is there any proportionality built into this section. Thus, there does not appear to be any legislative safeguards or guidelines for when this power to override is used by the Minister of Health.

Under this broad power, the Minister made the Interim Order which, rather than requiring significant evidence of safety and efficacy of the COVID-19 vaccines as mandatory requirements for approval, only required the vaccine manufacturers to provide:

3(1) sufficient information and material to enable the Minister to determine whether to issue the authorization, including,

(o) the known information in relation to the quality, safety, and effectiveness of the drug.

By letting the Minister make a decision based on “known information” about safety and effectiveness, this allowed the COVID-19 vaccines to be authorized in advance of actual knowledge about their safety or effectiveness. The Interim Order attempted to make up for this by having manufacturers promise to do more follow-up research as follows:

3(2) If, at the time an application is initially submitted to the Minister, the applicant is unable to provide information or material referred to in any of paragraphs (1)(g) to (k) and (m) to (o) or that information or material is incomplete, the applicant must include in the initial part of the application a plan as to how and when they will provide the Minister with the missing information or material.

However, as will be discussed further below, the Interim Order also prevented the Minister from revoking authorization once given, meaning that the Minister was absolved of the responsibility to protect the public if subsequent safety problems were discovered in the COVID-19 vaccines.

It’s vital to recognize that when the Interim Order was issued, the Minister of Health was the Honourable Patricia A. Hajdu. Ms. Hajdu attended Lakehead University, graduating with a Bachelor of Arts. In 2015, she received a Master of Public Administration from the University of Victoria. To our understanding, she possesses no medical training credentials that would be pertinent to making the required determinations under the regulations.

Approval of COVID-19 Vaccines was Virtually Guaranteed Under the Interim Order

Remarkably, the Interim Order effectively required Health Canada to authorize a COVID-19 vaccine for use in the Canadian population even in the absence of detailed evidence of safety and substantial evidence of efficacy.

Section 5 of the Interim Order provides:

5. The Minister must issue an authorization in respect of a COVID-19 drug if the following requirements are met:

(a) the applicant has submitted an application to the Minister that meets the requirements set out in subsection 3(1) or 4(2);

(b) the applicant has provided the Minister with all information or material, including samples, requested under subsection 13(1) in the time, form and manner specified under subsection 13(2); and

(c) the Minister has sufficient evidence to support the conclusion that the benefits associated with the drug outweigh the risks, having regard to the uncertainties relating to the benefits and risks and the necessity of addressing the urgent public health need related to COVID-19.

The test set out in (c) above is startling when compared to the traditional test for new drugs under the Regulations. Under the traditional test, evidence of safety and efficacy must be proven. Under the Interim Order, there only needs to be “evidence to support the conclusion” that the benefits outweigh the risks. This does not mean the Minister (Health Canada) has to be convinced and actually reach the conclusion. If the test was to convince Health Canada, the test would read:

“the Minister has sufficient evidence to conclude.”

The difference in language is important. Under this test, it appears that a vaccine would have to be authorized as long as there was sufficient evidence to support an argument that the benefits outweighed the risks.

In addition, the risk versus benefit test need not be robust, as the Minister is to “have regard” for the “uncertainties” of the benefits and risks. It is not clear how the Minister is expected to perform a risk versus benefit analysis when there is insufficient safety and efficacy evidence to determine true risks versus benefits. It is even more unclear how to perform a risk versus benefit analysis while “having regard to the uncertainties” of the risks versus benefits.

Ultimately, the Interim Order reveals that the Minister’s priority was the “necessity of addressing the urgent public health need related to COVID-19.” The problem, of course, is that under this test, the government placed its perceived “urgent public health need” ahead of safety and efficacy of the COVID-19 vaccines. This appears to be what the Government of Canada actually did.
Regardless of whether the need for a drug is urgent, this cannot override a proper assessment of safety, particularly when Canadians are under the impression that a drug has been proven safe. The National Citizens Inquiry (NCI) was not made aware of any public health authority in Canada cautioning Canadians that the vaccines had been authorized without the traditional need to prove their safety.

Instead, the Government of Canada was under enormous pressure in the media to secure vaccines and make them available to Canadians. In response, it placed orders for millions of doses from the manufacturers. This placed the Government in a conflict of interest because it had purchased and imported unapproved vaccines while it waited for itself to approve the vaccines. The Interim Order appears to have been designed to ensure that the vaccines would have no problem in receiving authorization.

As indicated above, in the traditional drug approval process, chances are not taken. If there is uncertainty about either safety or efficacy, the drug is not approved. There must be strict objective evidence of both safety and efficacy. It must also be objectively clear that the benefits outweigh the risks before a new drug is approved. It can only be objectively clear that the benefits of a drug outweigh the risks when the benefits and risks are objectively known.

The test for COVID-19 genetic vaccines abandoned this need for objective certainty instead of requiring objective proof of:

- safety,
- efficacy, and
- benefit outweighing risk.

The COVID-19 genetic vaccines were authorized under a subjective test which mandated that authorization must be granted if an argument could be made to support the conclusion that the benefits outweighed the risk. The question arises: what if there was evidence that went both ways? In other words, what if there was evidence that pointed towards greater benefits, but there was also evidence that pointed towards risks? Under the Interim Order, it seems the Minister must then take into account the subjective factors of uncertainty and the urgent public health need for a vaccine. This cannot be an appropriate standard for approving a drug that the Government intends to administer to the entire population.

---

136 An objective test is a type of assessment consisting of a set of items or questions that have specific correct answers (for example, How much is 2 + 2?), such that no interpretation, judgment, or personal impressions are involved in scoring.

137 A subjective test is an assessment tool that is scored according to personal judgment or to standards that are less systematic than those used in objective tests.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

It is difficult to conceive of a less-scientific test for drug authorization than that found in the Interim Order.

The Interim Order also ensured that the authorization of a COVID-19 genetic vaccine could not be revoked due to

- evidence the vaccine was unsafe or not-effective, and
- assessments that the benefits did not outweigh the risks.

This resulted from the fact that once a vaccine was authorized under the Interim Order, most of the Regulations did not apply, including C.08.006. This particular regulation is the safeguard that allows the Minister of Health to cancel a drug’s market authorization if evidence is uncovered that the drug is not safe. Instead, the Interim Order contained its own vague safeguards allowing for cancellation only in a few limited circumstances. The exclusion of the Minister’s normal powers to revoke authorization, and the reliance on more restricted revocation powers under the Interim Order, means that Canadians could not have confidence that the COVID-19 vaccines would be pulled from the market if there was evidence that they were not safe. This situation persisted for roughly a year.

Were the COVID-19 Genetic Vaccines Approved Without Proof of Safety or Efficacy?

In addition to the Interim Order, Health Canada created a document called “Guidance for market authorization requirements for COVID-19 vaccines.” This document is intended to provide guidance to pharmaceutical companies applying for market authorization. As it must, it follows the new subjective test for the vaccines. For example, the current version includes:

**About market authorizations for a COVID-19 genetic vaccine**

Health Canada will grant authorizations only if we determine that the benefits of the vaccine outweigh its potential risks. We will base our decision on the evidence provided on the vaccine’s safety, quality, and efficacy. For vaccines relying on the modified requirements in C.08.002 (2.1) of the Food and Drug Regulations, the risk–benefit analysis weighs the uncertainties about a potential vaccine against the public health need for a vaccine at the time of the decision.

Modified requirements for COVID-19 drugs make it possible for initial authorization, based on early data, while the manufacturer continues working on developing a vaccine. We will use terms and conditions to manage uncertainties or risk mitigation measures related to the vaccine in the context of public health.

---

The NCI heard testimony that the Health Canada employee who authorized all of the COVID-19 genetic vaccines swore an Affidavit for a lawsuit for Federal Court File No. T-145-22 in which she described the basis of Health Canada’s authorization of the Pfizer/BioNTech and Moderna vaccines. Instead of setting out the evidence relied on in support of the authorization, she simply parrots the words of the test. In the case of Pfizer/BioNTech, she stated that Health Canada reviewed “quality (chemistry and manufacturing), non-clinical (pharmacology and toxicology), and clinical (immunogenicity, safety, and efficacy) information” and then concluded that “the evidence supports the conclusion that the benefits associated with the Pfizer/BioNTech COVID-19 Vaccine outweigh the risks, having regard to a shorter term (median of two months) follow up of safety and efficacy at authorization, and the necessity of addressing the urgent public need related to COVID-19.”

In the case of Moderna, she stated similarly that “the evidence supported the conclusion that the benefits associated with the Moderna COVID-19 Vaccine outweighed the risks, having regard to a shorter term (median of two months) follow-up of safety and efficacy at authorization, and the necessity of addressing the urgent public health need related to COVID-19.”

Notably, what she does not cite in support of the vaccine authorization is

1. objective proof of safety,
2. objective proof of efficacy, and
3. objective proof that the benefits outweigh the risks.

Based on testimony to the NCI, and without further evidence from Health Canada, we cannot conclude that Health Canada properly evaluated the safety and efficacy of the COVID-19 vaccines before authorization. To the contrary, the authorization of the vaccines appears to have been all but pre-assured by the creation of the Interim Order.

The Interim Order Has Become Permanent

The Interim Order can only last for a maximum of one year. The Interim Order, therefore, was replaced on March 17, 2021, with permanent regulations that codify the subjective authorization test discussed above.139

The only notable change between the test in the Interim Order and the new permanent regulation is that the “public health need” that needs to be addressed is no longer described as urgent. Recall that the Interim Order required an examination of risks and benefits, while:

having regard to “the necessity of addressing the urgent public health need related to COVID-19.”

139 SOR/2021-45.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Now the test simply requires Health Canada to give consideration to

“the public health need related to COVID-19.”

Thus, under the permanent test, Health Canada no longer has to be swayed by urgency, but simply by the public health need related to COVID-19. In this way, it seems that so long as COVID-19 is a circulating virus, Health Canada must authorize any vaccine for which there is an argument to support the conclusion that its benefits outweigh its risks. In effect, we fear that there will never be a need for COVID-19 vaccine manufacturers to prove safety or efficacy of their products.

On a positive note, the NCI heard that the Minister’s ability to revoke authorization of COVID-19 vaccines is now subject to the same regular rules as other drugs that are approved for the market. It does beg the question, however, of why that particular rule was modified for COVID-19 vaccines in the first place?

Conflict of Interests for the Approval of Experimental Vaccines

Canada normally prohibits drugs from being imported into Canada unless they have been approved by Health Canada for use in humans.

Despite this, the Interim Order allowed unapproved and unauthorized COVID-19 genetic vaccines to be imported into Canada as long as the Canadian Government was the purchaser. This was called “prepositioning” in the Interim Order, and later in the Regulations codifying the Interim Order.140

The rationale was to assist Canada in expediting its response to the perceived COVID-19 crisis, by pre-purchasing and distributing the vaccines so they would be ready as soon as they were authorized.

However, this created a tremendous conflict of interest.

Once the vaccines were purchased, imported and ready for distribution, the Government of Canada would have suffered significant political blowback if it was unable to authorize them. Thus, it needed to authorize the COVID-19 vaccines, and it needed to do it quickly. The Government of Canada essentially put itself in charge of authorizing a drug that it had spent millions of public dollars on, had promised publicly on many occasions, and that it wanted to administer to every Canadian citizen.

The authorization of the COVID-19 vaccines was all but guaranteed. The Government of Canada ordered the vaccines, imported them, created new regulations to authorize them, and then took significant measures to convince and coerce every Canadian to take multiple doses. The political stakes were high, and the federal government had every motivation to get the vaccines authorized, regardless of their actual efficacy or safety.

140 SOR/2021-45.
There was no opportunity for sober second thought. There was no impartial oversight. The entire authorization process appears to have been “gamed” for one result, and one result only: authorization of vaccines for every Canadian, including children. Once the federal government made mass-vaccination its priority, it should no longer have been solely responsible for their authorization.

**Timing of the Interim Order**
The timing of the Interim Order is also curious and coincident. Notably, the September 16, 2020, Interim Order was created just two weeks before AstraZeneca’s authorization application was filed with Health Canada and just three weeks before Pfizer filed on October 8, 2020.

Since the authorization applications were made under the Interim Order, they would have been structured to meet the requirements of the Interim Order. Perhaps an authorization application is a standard document; however, the NCI suspects that it would be difficult for a company to prepare a detailed authorization application without knowing what the authorization requirements were going to be.

For this reason, there are further questions that need to be answered about how the applications could have been filed so quickly in a manner that satisfied the subjective test and whether there was participation in creating, or knowledge of, the contents of the test in advance.

**Phase Three Trial Data Alleged Manipulation of Data**

**Deanna McLeod:**
She reviewed the data on phase 3 clinical trials of COVID-19 vaccines.
(Vancouver: May 2, 2023)

Deanna McLeod’s testimony has raised important concerns about the means and methods used in testing COVID-19 vaccines. Her testimony primarily centred on potential conflicts of interest and biases within the teams responsible for conducting and reporting phase 3 test data, which was submitted to Health Canada.

Additionally, McLeod shed light on Pfizer’s historical legal issues and the broader issue of potential conflicts of interest within the regulatory and approval sector. Her testimony echoed Mr. Shawn Buckley’s prior statement that objective tests demonstrating safety and efficacy were omitted from these products. Financial incentives, at various stages of the testing and authorization process, were also discussed, prompting the need for a thorough examination of motivations.

McLeod’s testimony serves as a reminder of the importance of transparency, objectivity, and independence in the testing and approval of medical products, especially when it concerns a global health crisis. The potential for conflicts of interest and biases within such a critical process can erode public trust and compromise the credibility of the regulatory framework.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The reference to Pfizer’s past legal issues underscores the necessity for scrutinizing the track record of pharmaceutical companies involved in the development of vaccines or drugs. The public has a right to be informed about any potential historical shortcomings or ethical concerns that might impact the reliability of the products in question.

The removal of objective safety and efficacy tests from the products raises alarming questions about the standards applied to these vaccines. Rigorous testing is the cornerstone of any vaccine’s credibility and the foundation of public trust. Omitting such tests potentially undermines the credibility of the entire testing and approval process.

The mention of financial motivations at various levels of testing and approval emphasizes the need for greater transparency and accountability within the industry. The potential for financial incentives to influence decision-making is a cause for concern and demands further investigation to ensure that public health is prioritized over financial gain.

Lastly, the allusion to Statistics Canada data provided during the testimony highlights the need for comprehensive, reliable, and complete data when assessing the impact of any medical intervention. It is crucial to base decisions on thorough and unbiased information to ensure the wellbeing of the population.

In conclusion, Deanna McLeod’s testimony raises vital questions about the processes, motivations, and ethics involved in COVID-19 vaccine testing and authorization. Her testimony underscores the necessity for transparent, objective, and unbiased approaches in these critical endeavours. The concerns raised must prompt a broader discussion about regulatory practices, industry accountability, and the integrity of medical interventions in the interest of public health and safety.

Conclusions
There appeared to be a disconnect between Health Canada’s messaging concerning vaccine approval and the actual test used for authorization. As indicated above, safety, efficacy, and whether the benefits of the vaccines outweighed the risks did not need to be proven under the Interim Authorization process employed by Health Canada.

Despite the novel nature of the vaccines—in particular those using mRNA—the pharmaceutical companies did not have to objectively prove their safety and efficacy. It should be noted that the special authorization process created under the Interim Order was not mandatory, and pharmaceutical companies still had the option to apply for approval under the regular test which required objective proof of safety, efficacy, and cost-benefit.

The pharmaceutical companies did not choose to objectively prove safety, efficacy, and cost-benefit. They chose to apply under the Interim Order test, and regulators did not require it of them.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Of great concern is the disconnect between Health Canada’s public messaging about the COVID-19 vaccines as safe and effective when the regulatory authorization process clearly does not require these be objectively demonstrated. Health Canada continues to message to the public that the regular drug approval requirements of safety and efficacy were met. For example, at the top of Health Canada’s website page for the Pfizer vaccine, Health Canada states:

All COVID-19 genetic vaccines authorized in Canada are proven safe, effective and of high quality. (Please note that emphasis is provided in the original text.)

Recommendations

A. Newly implemented revisions to the Food and Drug Regulations related to the authorization of COVID-19 genetic vaccines must be rescinded as they permanently exempt COVID-19 vaccines from the requirements to objectively prove the safety or efficacy as required under the Food and Drug Regulations.

B. The current use of COVID-19 genetic vaccines in Canada that were authorized under the revised provisions of the Interim Order and the newly revised Food and Drug Regulations should be stopped immediately.

C. A full judicial investigation of the process under which the COVID-19 vaccinations were authorized in Canada must be carried out. Criminal liability, if discovered, may be dealt with under existing Canadian law.

D. All documentation concerning the authorization process and information provided to the regulatory agencies by the manufacturers should be made publicly available.

E. Legislation should be developed, or amended, to prevent the elimination of the legal requirements to prove that a new drug is objectively safe and that the efficacy of that drug is objectively proven.

F. The requirement for the regulatory board to carry out a risk–benefit analysis for any and all new drugs under consideration for approval should be codified into law. Written minimum requirements for such a review are to be established. The final decisions should be made on the basis of citizen health considerations not political motivations. The results of the risk–benefit must be made public.

G. We should review and revise the current relationship between licensing fees paid by pharmaceutical companies and the total budget allocated to Health Canada for drug-related matters. This is necessary to prevent pharmaceutical companies from exerting undue financial influence on the approval agency.

H. Legislation must be included or revised which re-establishes Canada’s approval agency as an independent, fact-based agency without reliance on approval agencies from outside of Canada.
I. Investigate any perceived or existing conflicts of interest that may exist between senior staff of Health Canada and pharmaceutical manufacturers. This may extend to a prescribed time limit prohibition of government agency staff from leaving government service for positions with the pharmaceutical manufacturers.

J. All investigations recommended in this section are to include the power to compel timely production of information and the power to subpoena witnesses.
7.5.8. Canada’s Future Approval of New Pharmaceuticals

Introduction
The Commission heard testimony regarding Canada’s intended changes to the process under which certain pharmaceuticals are given approval in Canada.

Based on the testimony, the Commission has concerns that the Government of Canada intends to apply a fast-track approval system to bring other, new pharmaceutical products to Canadian markets based on a new regulatory framework that appears to limit or eliminate the need to prove safety and efficacy.

Deanna McLeod
She explains how a new, expedited pathway allows for changes in traditional clinical trial processes. These changes remove the need to prove drug safety with level 1 evidence (RCTs).
(Winnipeg: April 13, 2023)

As discussed elsewhere in this Report, normally, vaccine development has a timeline of 5-10 years which involves first demonstrating safety in cells, tissues, and animals—through in vitro and animal testing—followed by three phases of human trials. This system is intended to test and prove the safety of drugs prior to approval for use in human populations.

The NCI heard that in-vitro and animal testing—prior to human trials—is critical to demonstrate safety in non-humans prior to proceeding to test in humans. This provides some degree of safety when designing studies in humans to monitor potential safety issues. This is a cornerstone of the clinical development process. The process follows the precautionary principle to determine possible safety signals to be monitored, not only in the short-term but also over time.

When Health Canada considers approving a drug, the drug company must demonstrate safety through each of the phases of testing. Approval is generally based on randomized-controlled trials, which are the only evidence that can prove safety and efficacy. In order to receive authorization to market a drug in Canada, a manufacturer must demonstrate safety, efficacy, and that the benefits of the drug outweigh the risks.

The precautionary principle that underpins today’s approval regulations resulted from regulatory reform implemented after the drug Thalidomide caused widespread harm to women and babies—as a result of being approved to treat morning sickness without first demonstrating that it was safe.

The precautionary principle is particularly important in the area of drugs known as biologics since these products have the ability to affect the human body in a profound way. The NCI heard that an abundance of caution should govern the testing and approval of novel biologics, which include gene therapy. The standard for safety testing set out by the FDA for biologics is 15 years.
Industry-Designed Backdoor Approval
The NCI heard that starting in 2016, industry-advocacy groups pushed for changes to the regulatory framework in Canada. Pressure was placed on Canada to attract new investment by overcoming barriers to innovation. The barriers to innovation include Canada’s high safety standards for drug approval.

This spurred the formation of several initiatives such as the Advisory Council for Economic Growth and the Health and Biosciences, Economic Strategy Table to study and produce reports relating potential reform of Canada’s regulatory process.

A new regulatory pathway was subsequently created as a type of backdoor approval for certain drugs. The new pathway allows for expedited clinical trials and product authorizations. The new process was adopted into law by burying it in an omnibus bill in December 2020. Under this new rule, the Minister of Health can designate a drug to follow the new approval process. Notably the Minister of Health in Canada at this time had no medical background but was an economics expert.

Therefore, Canada’s new approach to advanced therapeutic treatments is to

- Maintain appropriate, yet flexible, regulatory oversight,
- Promote innovation in drug and medical device development,
- Ensure high standards for patient safety, product quality, efficacy, and effectiveness, and
- Reduce barriers to bringing advanced therapeutic treatments to market in Canada, thus providing access to new, potentially life-changing treatments

It is notable that three of the four points above relate to promoting economic development and profit relating to therapeutics.

The COVID-19 vaccines were the first therapeutics that followed this new process. The concerns that have arisen from the safety of the COVID-19 vaccines demonstrate exactly the problem with prioritizing innovation and economics over safety.

The Commission heard testimony that the Government of Canada intends to use this expedited approval framework for more novel products in the future. The motivation behind creating this new regulatory process appears to be economic, namely, to grow Canada’s economy and attract foreign investment. While these may be laudable goals, the Commission is concerned that prudent safety standards are being sacrificed in order to meet economic goals.

Recommendations
A. Revocation of New COVID-19 Regulations: The Commission recommends that the new regulatory process be revoked and that Health Canada return to approving all therapeutics on its historical safety requirements.
B. **Maintain Rigorous Safety Standards**: Prioritize patient safety by maintaining rigorous safety standards for drug approval. The safety of new pharmaceuticals should be thoroughly demonstrated through preclinical and clinical trials before approval.

C. **Transparency in Regulatory Changes**: Ensure transparency in any regulatory changes related to pharmaceutical approvals. Changes in the approval process should be subject to public consultation and should be clearly communicated to stakeholders, including healthcare professionals and the public.

C. **Independent Expertise**: Appoint experts with relevant medical and scientific backgrounds to key positions in the regulatory process. Decision-makers, such as the Minister of Health, should have a strong understanding of medical and scientific principles to make informed decisions about drug approvals.

D. **Balancing Innovation and Safety**: Find a balance between promoting innovation and ensuring safety. While innovation is important for advancing healthcare, it should not come at the expense of patient safety. Consider the potential long-term effects of novel drugs on public health.

E. **Monitoring and Post-Market Surveillance**: Strengthen post-market surveillance of approved pharmaceuticals. Continuous monitoring of drugs once they are on the market is crucial to detect and address any safety concerns that may arise over time.

F. **Independent Safety Review**: Establish an independent body or commission responsible for conducting safety reviews of pharmaceuticals, especially novel biologics and gene therapies. This body should be free from industry influence and focused solely on patient safety.

G. **Public Health Impact Assessment**: Conduct thorough assessments of the potential public health impact of new drugs, particularly in the context of pandemics or health emergencies. Consider both short-term and long-term consequences on public health.

H. **Ethical Considerations**: Incorporate ethical considerations into the approval process. Ensure that the potential benefits of new pharmaceuticals outweigh the risks and that patient autonomy and Informed Consent are respected.

I. **Regular Reviews of Regulatory Frameworks**: Periodically review and update regulatory frameworks to adapt to advances in medical science and changing public health needs. Regulatory changes should prioritize safety while facilitating timely access to beneficial treatments.

J. **International Best Practices**: Benchmark Canada’s regulatory processes against international best practices. Learn from the experiences of other countries with strong pharmaceutical regulatory systems.
K. **Public Awareness and Education**: Enhance public awareness and education about the drug approval process, including the rigorous testing and safety measures in place. Informed patients can make better decisions about their healthcare.

L. **Monitoring Economic Impact**: While promoting economic development is important, closely monitor the economic impact of regulatory changes. Ensure that economic goals do not compromise patient safety, and make necessary adjustments if conflicts arise.

These recommendations aim to strike a balance between promoting innovation and safeguarding patient safety in Canada’s pharmaceutical approval process. It’s crucial to prioritize public health and long-term safety while fostering an environment conducive to innovation and economic growth in the pharmaceutical industry.
7.5.9. Medical Practice and Ethics During COVID-19

Introduction

Once the COVID-19 pandemic was announced in March of 2020, the medical profession unilaterally changed and/or abandoned the fundamental tenets under which medicine is practised in Canada and in most parts of the world.

The relationship between a medical practitioner and their patient is a unique and sacred one. The patient trusts the medical professional to provide the patient with the best quality of care available and to deliver those services with a high level of skill and professionalism.

The patient must trust that the medical practitioner is providing them with the latest unbiased information, based on current independent scientific evidence. There can be no allowance for blurring of science with political propaganda when it comes to this information.

The very nature of this relationship is that the patient is reliant on the medical professional to provide them with facts and the unbiased information required, explained in a way that the patient can understand, which then permits a patient to decide what care is most appropriate to them. As each patient is unique, the medical professional must take into account the patient’s actual situation and level of understanding when presenting information.

The process of a medical practitioner providing a patient with accurate, non-biased information and assuring that the patient understands that information while at the same time is making their own personal decisions concerning their healthcare is often referred to as “Informed Consent.”

Often the information that a patient exchanges with their medical provider is profoundly personal, and there has always been a strict policy of absolute privacy been a patient and their medical practitioner.

The absolute requirement for privacy of the patient–doctor exchange is necessary as the patient must feel confident to share the most intimate details of their life with the medical practitioner. If the patient does not have this guarantee of privacy, they may not properly explain the details of their condition to the medical practitioner or may not seek professional assistance at all due to their embarrassment.

This doctrine is often referred to as “Patient-Doc-or Confidentiality.”

The Commission heard testimony from both patients and medical practitioners concerning the widespread violation of each of these two fundamental doctrines of medicine, which occurred in all regions of Canada throughout the pandemic.

Healthcare providers in Canada have a legal duty to provide a certain standard of skill and care to their patients. This is normally referred to as “Duty of Care.”
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

This Duty of Care is usually considered to comprised of duties including

- attending,
- diagnosing,
- referring,
- treating, and
- instructing the patient.

If a healthcare provider breaches that Duty of Care and a patient suffers an injury as a result of that breach, then the healthcare provider may be guilty of negligence.

These principles, and many others, are not simply guidelines but are legally enforceable under law. The laws which apply and are enforceable in Canada include Canadian, Provincial, and Territorial law, and International Laws and Treaties to which Canada is a signatory.

Testimony Concerning Medical Practice and Ethics During COVID-19
Witnesses who testified concerning medical practice and ethics during COVID-19 included a range of different perspectives, including

- patients,
- doctors,
- nurses,
- paramedics,
- administrators, and
- instructors.

In general, the testimony described a medical system that has completely abandoned the basic tenets of medicine and has violated the laws and regulations which govern the ethical practice of medicine across Canada.

The practice of medicine is regulated within each province and territory by regulatory bodies, which are empowered under certain provincial and territorial legislation.

These regulatory bodies are in place to regulate most healthcare professionals in Canada. This includes doctors, nurses, paramedics, pharmacists, and many more.

Informed Consent
Each province has their own specific regulations, but most are similar to each other.

As an example, below is a link to the Health Care Consent Act, 1996, from Ontario.\textsuperscript{141}

Excerpts from the Ontario Health Care Consent Act include the following provisions:

\begin{verbatim}
(accessed 2023)
\end{verbatim}
No treatment without consent

10 (1) A health practitioner who proposes a treatment for a person shall not administer the treatment, and shall take reasonable steps to ensure that it is not administered, unless,

(a) he or she is of the opinion that the person is capable with respect to the treatment, and the person has given consent; or

(b) he or she is of the opinion that the person is incapable with respect to the treatment, and the person's substitute decision-maker has given consent on the person's behalf in accordance with this Act. 1996, c. 2, Sched. A, s. 10 (1).

Elements of consent

11 (1) The following are the elements required for consent to treatment:

1. The consent must relate to the treatment.
2. The consent must be informed.
3. The consent must be given voluntarily.
4. The consent must not be obtained through misrepresentation or fraud. 1996, c. 2, Sched. A, s. 11 (1).

Informed consent

(2) A consent to treatment is informed if, before giving it,

(a) the person received the information about the matters set out in subsection (3) that a reasonable person in the same circumstances would require in order to make a decision about the treatment; and

(b) the person received responses to his or her requests for additional information about those matters. 1996, c. 2, Sched. A, s. 11 (2).

Same

(3) The matters referred to in subsection (2) are:

2. The expected benefits of the treatment.
3. The material risks of the treatment.
4. The material side effects of the treatment.
5. Alternative courses of action.
6. The likely consequences of not having the treatment. 1996, c. 2, Sched. A, s. 11 (3).
Withdrawal of consent

14 A consent that has been given by or on behalf of the person for whom the treatment was proposed may be withdrawn at any time,

(a) by the person, if the person is capable with respect to the treatment at the time of the withdrawal;

(b) by the person’s substitute decision-maker, if the person is incapable with respect to the treatment at the time of the withdrawal. 1996, c. 2, Sched. A, s. 14.

Continuing the example of the above Ontario regulations, the Ontario College of Physicians and Surgeons (CPSO), who are charged with the regulation of the practice of medicine in Ontario, provide additional information and guidance to physicians related to Informed Consent.

Under the “What We Do” section of the CPSO website it states:

What we do:

Registration—Physicians are required to be members of the College to practise medicine in Ontario. The College’s Registration Department handles all inquiries regarding the registration process.

Quality—CPSO has a legislated mandate to ensure quality care is provided by physicians. Our Quality Control Program is a proactive needs-based approach, which will contribute to improved quality of care, patient safety and will result in significant benefits to patients, providers and ultimately the healthcare system itself.

Investigations & Discipline—A central responsibility of CPSO is to respond to concerns and investigate complaints from members of the public about doctors in Ontario. If necessary, cases are referred to the Ontario Physicians and Surgeons Discipline Tribunal.142

Guiding Professional Conduct—Develop policies to provide guidance to physicians about legislative/regulatory requirements and the expectations of the medical profession.

Under the section of the website titled “Policies,” CPSO has the following policy:

Consent to Treatment

General Expectations

142 https://opsdt.ca/, (accessed 2023)
1. Physicians must be aware of, and comply with, all of the requirements in the Health Care Consent Act, 1996 (HCCA).

2. Physicians must obtain valid consent before a treatment is provided.

3. Patients and substitute decision-makers (SDMs) have the legal right to refuse, withhold, or withdraw consent to a treatment, and physicians must respect this decision even if they do not agree with it.

4. Physicians are advised to consider and address language and/or communication issues that may impede a patient’s ability to give valid consent.
   - Physicians must use their professional judgment to determine whether it is appropriate to use family members as interpreters, and are advised to take the potential limitations of doing so into account in the specific circumstances (for example, the family dynamics, the seriousness of the condition and/or treatment, etc.).

5. Physicians are advised to obtain independent legal advice if they are unsure of their legal obligations in specific circumstances. The obligation to ensure that valid consent is obtained always rests with the physician proposing the treatment.

Obtaining Consent

6. For consent to be valid, physicians must ensure that it:
   - Is obtained from the patient, if they are capable with respect to treatment, or from the patient’s SDM, if the patient is incapable with respect to treatment.
   - Relates to the specific treatment being proposed.
   - Is informed.
   - Is given voluntarily and not under duress.
     - If physicians believe that consent is not being freely given, they must ensure that there has been no coercion.
   - Is not obtained through misrepresentation or fraud.
     - Physicians must be frank and honest when interacting with patients, including when conveying information about the proposed treatment.
7. To ensure that consent is informed, physicians must:

- provide information about the nature of the treatment, its expected benefits, its material risks and material side effects, alternative courses of action and the likely consequences of not having the treatment prior to obtaining consent, which includes:
  - providing information that a reasonable person in the same circumstances would require in order to make a decision about the treatment;
  - considering the specific circumstances of the patient, on a case-by-case basis, and using their clinical judgment in determining what information to provide; and
  - providing information relating to material risks that are relevant for a broad range of patients and those that are particularly relevant for the specific patient;
- engage in a dialogue with the patient or the SDM (as the case may be) about the information specified in 7.a., regardless of whether physicians use supporting documents (such as consent forms, patient education materials or pamphlets) to facilitate the provision of this information;
- provide a response to requests for additional information about the treatment; and
- be satisfied that the information provided is understood and, as such, take reasonable steps to facilitate the comprehension of the information provided.

Testimony was received indicating that the principle of Informed Consent was violated through force and/or coercion of patients into taking the vaccine and by the absence of sufficient truthful information concerning the unique and experimental nature of the mRNA vaccines.

Based on witness evidence, widespread information that was being published and presented to clients concerning the potential adverse effect of the vaccines was not accurate and not complete.

Several witnesses testified that they were given little or no information concerning the risks associated with taking the COVID-19 genetic vaccines, prior to taking it.

Witness testimony indicated that the blanket statement of “safe and effective” was constantly used and that they were never informed about the potential risks of the vaccine, the experimental nature of the vaccine, or that the vaccines were approved under an Interim Order which exempted the manufacturers from satisfying the normal requirements for vaccine safety testing.
Pregnant women were not informed that the COVID-19 genetic vaccines had not been expressly tested on pregnant women and that no long-term testing had been carried out to determine if there was any risk to the unborn child or to breastfeeding mothers.

People were not informed that the vaccine carried a risk of death as a potential and reported side effect.

People were not informed that their risk of dying from the disease was directly linked to their age and the existence of any comorbidities.

Dr. Francis Christian provided a document “Consent for COVID-19 genetic vaccine for Children.” The document is from Saskatchewan Health. The document states the following:

It is recommended that parents/guardians discuss consent for immunization with their children. Efforts are first made to get parental/guardian consent for immunizations. However, children 13 years and older who are able to understand the benefits and possible reactions for each vaccine and the risks of not getting immunized, can legally consent143 to receive or refuse immunizations in Saskatchewan by providing mature minor Informed Consent to a healthcare provider.

This statement is an attack on parental rights. It essentially states that if the parent, or guardian, does not agree to the medical procedure that the healthcare provider can ignore the parental directive as long as the child is over 13 years of age.

What child, at the age of 13, can understand the nuances of the information being provided by the government concerning the potential risk that COVID-19 posed to children versus the risk of death or other significant reported side effects of taking the experimental vaccine?

Dr. Francis Christian testified concerning what he felt was the minimum information that should have been given to children to accommodate the requirements of Informed Consent. Following is a list of these minimum requirements, based on information available since June 2021:

- The risk of your child dying of COVID is almost zero.
- The vaccine has a new gene technology that has never been used clinically before.
- The vaccine was approved using “emergency use” or “interim use” authorization. It is experimental. Its medium- and long-term adverse effects are unknown.
- To qualify for emergency use authorization, there must be an emergency—there is no emergency in healthy children.
- Children are of no danger to adults.

143 Please note that the highlights above have been added by the authors.
There are thousands of deaths associated with the vaccine (VAERS and other reports).

Myocarditis is a serious condition and can be caused by the vaccine. Its real incidence is unknown—1/5,000 to 1/250. Myocarditis can be fatal. Many other serious vaccine adverse events are happening.

The risk of the vaccine for your healthy child is likely more than the risk of COVID.

This minimum information was not given to parents concerning vaccination of their children.

The Ontario college of Physicians and Surgeons (CPSO) on their website, under the heading of COVID-19 FAQ’S for Physicians, Pandemic-Related Practice Issues, Update March 23, 2022, stated, the following about what a physician should do when facing a patient who did not want to get the COVID-19 genetic vaccine:

It is also important that physicians work with their patients to manage anxieties related to the vaccine and not enable avoidance behaviour. In cases of serious concern, responsible use of prescription medications and/or referral to psychotherapy are available options. Overall, physicians have a responsibility to allow their patients to be properly informed about vaccines and not have those anxieties empowered by an exemption.

There are a number of issues within this CPSO statement that are problematic when it comes to the requirement for obtaining “Informed Consent.”

First, the CPSO refers to people who choose not to take the vaccine as needing to manage their anxieties, and they are calling the decision to not take the vaccine as “avoidance behaviour.” This type of language can only serve to stigmatize the patient and undermine what is supposed to be a free and uncoerced decision about a medical procedure.

Secondly, they are inferring that the decision to not take the COVID-19 vaccine is a mental illness which the physician should consider treating with prescription medications of psychotherapy.

These statements by the CPSO are chilling, to say the least. They are in direct contravention of the Ontario Health Care Consent Act which states the following:

11 (1) The following are the elements required for consent to treatment:

1. The consent must relate to the treatment.
2. The consent must be informed.
3. The consent must be given voluntarily.
4. The consent must not be obtained through misrepresentation or fraud. 1996, c. 2, Sched. A, s. 11(1).

Please note that the highlights above have been added by the authors.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The use of prescription medications and subjecting a patient to psychotherapy in order to convince the patient to change their mind can hardly be considered "voluntary consent."

Under CPSO’s own website within the section “Policies,” concerning Informed Consent, CPSO states the following:

8. Patients and substitute decision-makers (SDMs) have the legal right to refuse, withhold, or withdraw consent to a treatment, and physicians must respect this decision even if they do not agree with it.

How does suggesting that physicians treat the legitimate concerns and decision of a patient as an anxiety condition, which can be treated with prescription drugs and psychotherapy, respect the patients' choice?

Patients were threatened with loss of employment, social isolation, stigmatization, or other non-specified threats if they did not comply with the vaccine mandates. These threats were pervasive, as previously discussed. Media actively promoted hate and even violence against people who would not get vaccines.

Prime Minister Trudeau called people “racists” and “misogynists” and suggested that the government would have to decide what to do with them—remarks that reasonable people might find threatening.

In many instances, governments couched the information concerning COVID-19 vaccinations in language that stated the vaccines were safe and effective as demonstrated by decades of experience with safe and effective vaccinations. These statements hid the fact that mRNA injections were not like any traditional vaccination that had been used prior to this time.

According to Dr. Peter McCullough, these mRNA vaccines should rightly have been dealt with using the regulations related to biologic drugs, and it was, in his opinion, medical malfeasance to have approved them under the protocols used for vaccines.

It also hid the fact that based on the Interim Order under which the COVID-19 genetic vaccines had been approved, the manufacturers were not required to prove that the vaccines were safe and effective.

Further, the government did not carry out a risk–benefit analysis of the vaccines since they did not have enough information to do so.

The vaccines had not been approved based on proven scientific evidence, they were approved on the basis of a political agenda.

The public could not have given the required Informed Consent since they were under threat and coercion and were never provided with enough truthful and adequate information to form consent.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The media and government officials inflamed the situation and created an atmosphere of terror and hate which permeated every aspect of Canadian society; this further caused patients to be unable to form a reasoned decision concerning this novel medical gene therapy.

Patient-Doctor Confidentiality
Testimony was provided by a variety of witnesses indicating that their confidential medical records were reviewed by third parties without their consent or that they were required to disclose private medical information to third parties under the mandated policies.

Witnesses, including patients and physicians, described how the principal of medical confidentiality was violated.

In general terms, the testimony described the following instances:

Citizens were required, by government mandate, to disclose personal information about their medical history, including disclosure of the results of genetic testing and the disclosure of information concerning certain medical procedures.

These disclosures were required to be made to third parties, including both medical and non-medical personal. Non-medical personnel to whom personal medical information was mandated to be disclosed included:

- restaurant staff,
- store clerks,
- school staff,
- church volunteers, and
- bus drivers.

Disclosure was required by just about anyone, without any consideration of privacy or qualification. This was required for persons to participate in the most basic and fundamental activities within our society.

How did the government protect the confidentiality of this information?

What actions did the Colleges of Physicians and Surgeons in Canada take to advise their members and safeguard the public against these non-confidential disclosures?

People were required to disclose their vaccination status and the status of any genetic testing that they underwent concerning COVID-19. This is contrary to the Canadian Genetic Non-Discrimination Act which states the following:

https://www.laws-lois.justice.gc.ca/eng/acts/G-2.5/page-1.html#h-247317
Genetic test

3 (1) It is prohibited for any person to require an individual to undergo a genetic test as a condition of

• (a) providing goods or services to that individual;
• (b) entering into or continuing a contract or agreement with that individual; or
• (c) offering or continuing specific terms or conditions in a contract or agreement with that individual.

Refusal to undergo genetic test

(2) It is prohibited for any person to refuse to engage in an activity described in any of paragraphs (1)(a) to (c) in respect of an individual on the grounds that the individual has refused to undergo a genetic test.

Disclosure of results

4 (1) It is prohibited for any person to require an individual to disclose the results of a genetic test as a condition of engaging in an activity described in any of paragraphs 3(1)(a) to (c).

Refusal to disclose results

(2) It is prohibited for any person to refuse to engage in an activity described in any of paragraphs 3(1)(a) to (c) in respect of an individual on the grounds that the individual has refused to disclose the results of a genetic test.

The Act defines a genetic test as the following:

**genetic test** means a test that analyzes DNA, RNA or chromosomes for purposes such as the prediction of disease or vertical transmission risks, or monitoring, diagnosis or prognosis. *(test génétique)*

Physicians and surgeons described how a third party, an unknown staff member from the government or public health department, would directly contact a patient and provide advice that often contradicted the advice given by the physician to the patient.

This public health staff member did not have previous contact with the patient nor had they been consulted by the patient or the doctor; however, they were countermanding the physician’s advice to that patient.
Dr. Gregory Chan testified that he had submitted 56 Adverse Reaction Reports to Alberta Health Services. He testified that half of the 56 reports were never acknowledged. Of the remaining 28 reports of adverse reactions, Alberta Health Services told Dr. Chan that for 16 of these 28 Adverse Reaction Reports that the patient should receive a second injection of the COVID-19 genetic vaccine. This advice from Alberta Health Services was provided to Dr. Chan without anyone from Alberta Health Services actually seeing the patient in question.

Dr. Chan specifically spoke about a young man who was a professional level hockey player who was told to get the COVID-19 injections, despite having recovered from a previous COVID-19 infection. Within 24 to 48 hours of receiving the COVID-19 genetic vaccine injection, the young man was unconscious and taken to the hospital due to cardiac issues. Alberta Health Services advised the young man to get a second injection of the vaccine, without having examined the young man or consulting with the physician treating him.

Dr. Chan described two other instances, one concerning a nurse and the other concerning a police officer, in which Dr. Chan felt the symptoms were caused by the vaccine; however, the Alberta Health Services advised that these patients should receive a second dose of the vaccine.

In Dr. Chan’s opinion, staff from Alberta Health Services were providing patient diagnosis and recommendations without ever having seen the patient.

Dr. Francis Christian stated, during his testimony, that the medical profession allowed a third party to insert itself between the patient and the physician through algorithmic guidelines. Most guidelines were developed from industry-funded physician groups, which, in essence, violates the sanctity of the patient–physician relationship. The guidelines soon became enforceable restrictions by the regulatory bodies, so physicians no longer had an option to treat their patients based on their own diagnosis.

Dr. Patrick Phillips testified that he had reported 10 Adverse Event Reports to the public health system after having examined each of the 10 patients. Public health rejected 9 of the 10 reports without actually having examined any of the patients, and Dr. Phillips was not given any specific criteria for those rejections. After having examined a patient, based on that examination, Dr. Phillips prescribed a course of ivermectin and vitamins for a treatment of that particular patient. A pharmacist reported that prescription, and the hospital ordered that the diagnosis and prescription be rescinded without any consultation. Dr. Phillips was later suspended by the regulatory body.

Dr. Chris Milburn, in his testimony, indicated that the College of Physicians and Surgeons had stated that it was a physician’s duty to follow their policies despite the actual evidence and examination of a particular patient by that physician. Thus, the policy of the College of Physicians and Surgeons had inserted itself between the physician and patient, dictating care protocols.

**Duty of Care**

Healthcare providers have a special duty of care to their patients because of the imbalance of knowledge that exists between a patient and the healthcare provider. Access to, and understanding
of, complex medical information favours the healthcare provider, and healthcare providers know that their patients are reliant on the knowledge of the healthcare provider.

Healthcare providers must take into account that patients are vulnerable to their opinions. The patient relies on the understanding that the healthcare provider will put the needs of the patient first and that any services provided to the patient will be based on a factual and individual assessment of the patient’s unique situation.

According to the College of Physicians and Surgeons of Ontario:

Physicians should be skilled clinicians committed to the values of the profession.

Physicians should be committed to lifelong learning and be responsible for maintaining the medical knowledge and clinical skills necessary to provide the highest possible quality of care to patients.

At all times physicians should:

• be aware of deficiencies in knowledge or ability;

• obtain help when needed; and

• ensure that their practice matches their level of competence.

In terms of individual patient care, physicians should provide medical care based on objective evidence whenever possible. This includes demonstrating a sense of inquiry and taking a scientific approach to solving clinical issues for the benefit of the patient.

Physicians have a duty to seek out new evidence and knowledge, to share this knowledge with others and to apply it in practice.

Physicians are expected to keep abreast of current developments in their field, which includes maintaining an awareness of relevant practice guidelines and implementing them as appropriate. All research must be initiated and pursued in an ethical manner.

Many of the witnesses testified how the regulatory bodies were dictating what a healthcare provider could say, diagnose, report, and prescribe. These mandates further severely restricted the healthcare provider from offering patients exemptions to the political pandemic mandates, based on the unique circumstances of the particular patient.

Healthcare providers were discouraged from carrying out any research into the nature of the COVID-19 pandemic and restricted from, or in some cases prevented from, undertaking any research that might have challenged the politically dictated mandates and narratives.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

By blindly following these mandates without due regard to the evolving information available on populations at risk and different alternative treatment options, healthcare providers failed to uphold the requirement under their responsibility of Duty of Care.

Healthcare providers have a duty to carry out their own research to confirm the claims being made by a particular manufacturer or purveyor of information concerning patient treatments; they are not entitled to blindly believe the literature provided to them by industry representatives.

In the case of the COVID-19 pandemic, many healthcare providers and their regulators made no apparent attempts at evaluating the information that was being provided to them by their political leaders and industry representatives.

They blindly imposed these prescriptions upon their membership and the membership followed the instruction in lockstep.

Few healthcare providers challenged the political narrative, and those that did faced severe consequences including revocation of their licence to practise medicine.

Witnesses who testified concerning Medical Practice During COVID-19:

**Gail Davidson**
A lawyer, she reviewed Canada’s obligations under international human rights law.
(Vancouver: May 4, 2023)

**Natasha Gonek**
She presented her findings on regulatory failures.
(Ottawa: May 17, 2023)

**Maurice Gatien**
A lawyer, he discussed his defence of the vaccine-injured.
(Ottawa: May 18, 2023)

**Dr. Keren Epstein-Gilboa**
A developmental psychologist, she described the impact of COVID measures on children.
(Ottawa: May 18, 2023)

**Allison Petton**
A registered nurse, she discussed informed consent to a medical procedure.
(Truro: March 17, 2023)

**Dr. Edward Leyton**
A physician, he reviewed the influence of medical institutions and the use of ivermectin.
(Ottawa: May 18, 2023)
Dr. Chris Shoemaker
A physician, he discussed the dangers of the COVID vaccine.
(Ottawa: May 19, 2023)

Dr. Misha Susoeff
A dentist, he discussed third party and Informed Consent.
(Red Deer: April, 28)

Melanie Alexander
She revealed the story of her husband’s medical mistreatment during COVID.
(Ottawa: May 19, 2023)

Dr. Daniel Nagase
A physician, he discussed the unjust treatment of patients and doctors during COVID.
(Ottawa: May 19, 2023)

Samantha Monaghan
She described the loss of her son after a blood transfusion.
(Ottawa: May 18, 2023)

M Tisir Otahbachi
He shared his story of vaccine injury and his mistreatment by the healthcare system.
(Ottawa: May 17, 2023)

Adam Zimpel
A severely disabled man, he described his social isolation due to COVID measures.
(Ottawa: May 17, 2023)

Mallory Flank
A former paramedic, she reported on her vaccine injury.
(Ottawa: May 17, 2023)

Kristen Nagle
A nurse, she was defamed for speaking out about COVID measures.
(Ottawa: May 17, 2023)

Sheila Lewis
She described her heartbreaking story of being removed from the transplant list.
(Ottawa: May 17, 2023)

Dr. Stephen Malthouse
A physician, he described how he challenged COVID policies.
(Ottawa: May 17, 2023)
Camille Mitchell
A pharmacist, she described the impact of COVID mandates.
(Vancouver: May 4, 2023)

Shawn Muldoon
He talked about his experience with severe vaccine injury.
(Vancouver: May 4, 2023)

Paul Hollyoak
A coast guard rescue specialist, he reported on his vaccine injury.
(Vancouver: May 4, 2023)

Ted Kuntz
He reviewed the lack of safety, efficacy, and informed consent for childhood vaccines.
(Vancouver: May 4, 2023)

Kristin Ditzel
She spoke about her neurological disability after taking a COVID vaccine.
(Vancouver: May 4, 2023)

Patricia Leidl
She spoke about the trials of finding medical treatment for her severe vaccine injury.
(Vancouver: May 4, 2023)

Dr. Ben Sutherland
A researcher for Oceans and Fisheries Canada, he spoke about the consequences of vaccine mandates on his work.
(Vancouver: May 3, 2023)

Lisa Bernard
A nurse, she testified on vaccine injury and the impact of lockdowns on patient care.
(Vancouver: May 3, 2023)

Dr. Charles Hoffe
A physician, he discussed natural immunity and COVID vaccine health issues.
(Vancouver: May 3, 2023)

Aurora Bisson-Montpetit
A former nurse, fired from her job due to mandates, she investigated the public health authorities responsible for COVID measures.
(Vancouver: May 3, 2023)
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

**Dr. Greg Passey**
A physician specializing in post-traumatic stress disorder, he reviewed the narrative shaping and psychological damage from lockdowns.
(Vancouver: May 3, 2023)

**Serena Steven**
A former nurse, she described her vaccine-related injuries and hospital care during early lockdowns.
(Vancouver: May 2, 2023)

**Philip Davidson**
A former public service employee, he testified about job loss due to vaccine mandates.
(Vancouver: May 2, 2023)

**Vanessa Rocchio**
She described her cardiac problems after taking a COVID-19 vaccine.
(Vancouver: May 2, 2023)

**Jennifer Curry**
She spoke about her severe vaccine injury and its impact on her life.
(Red Deer: April 28, 2023)

**Darcy Harsch**
He testified about the impact of being put on unpaid leave due to vaccine mandates.
(Red Deer: April 28, 2023)

**Suzanne Brauti**
She described how she was denied a religious exemption and lost her job.
(Red Deer: April 28, 2023)

**Grace Neustaedter**
A registered nurse, she testified on the workplace pressures to comply with vaccine mandates.
(Red Deer: April 28, 2023)

**John Carpay**
A lawyer, he testified on legal issues regarding vaccine mandates.
(Red Deer: April 28, 2023)

**Judy Soroka**
A former nurse, she spoke about how her health condition deteriorated without access to treatment, resulting in pain and disability.
(Red Deer: April 28, 2023)
Dr. Gregory Chan  
A physician, he testified on the problems of reporting vaccine adverse events.  
(Red Deer: April 26, 2023)

Dr. Maria Gutschi  
A pharmacist and drug regulatory specialist, she discussed problems with the development and manufacturing of the mRNA vaccines.  
(Saskatoon: April 21, 2023)

James Kitchen  
A lawyer, he spoke about the courts’ failure to uphold individual Charter rights and the capture of professional regulatory bodies.  
(Red Deer: April 21, 2023)

Ann McCormack  
A former pharmacist, she spoke about Informed Consent.  
(Red Deer: April 20, 2023)

Marjaleena Repo  
She testified on how she was mistreated because of her mask exemption.  
(Red Deer: April 20, 2023)

Dr. Francis Christian  
A physician, he talked about the censorship of physicians, his concerns over vaccinating children, and the doctor-patient relationship.  
(Red Deer: April 20, 2023)

Dr. Dion Davidson  
A vascular surgeon, he stressed the importance of Informed Consent, the problems of vaccine adverse events, and the difficulties of reporting them.  
(Truro: March 18, 2023)

David Leis  
He spoke about government overreach and the failure of our institutions to serve the public.  
(Winnipeg: April 15, 2023)

Elizabeth Cummings  
She took a COVID vaccine based on false information from her doctor and suffered a vaccine injury.  
(Truro: March 17, 2023)

Peter Van Caulert  
He was coerced into taking the vaccine due to travel restrictions.  
(Truro: March 17, 2023)
Terry LaChappelle
As a federal public servant, he was forced to get the vaccine or lose his job.
(Truro: March 17, 2023)

Paula Doiron
She took a vaccine due to false information and suffered an vaccine injury.
(Truro: March 17, 2023)

Leigh-Anne Coolen
She was forced by her employer to get vaccine and suffered a vaccine injury.
(Truro: March 16, 2023)

Michael Alexander
A lawyer, he testified that medical regulators charged health professionals with misinformation and harming the public when they spoke out against the public health narrative.
(Toronto: March 31, 2023)

Dan Hartman
He testified that his 17-year-old son was required to take a COVID vaccine to play hockey and died four days later.
(Toronto: April 1, 2023)

Artur Anselm
He was forced to take a vaccine to keep his job.
(Truro: March 16, 2023)

Chet Chisholm
A paramedic, the pandemic affected his ability to get treatment for post-traumatic stress disorder, preventing him to return to work; he also suffered a vaccine injury.
(Truro: March 16, 2023)

Vonnie Allen
A nurse, she was fired for refusing to take a COVID-19 genetic vaccine.
(Truro: March 16, 2023)

Cathy Careen
Despite having a vaccine medical exemption, she lost her job for refusing to take a COVID vaccine.
(Truro: March 16, 2023)

Dr. Patrick Phillips
A physician, he spoke about Informed Consent, his reporting of vaccine adverse reactions, and the suspension of his medical licence for speaking out about COVID policies.
(Truro: March 16, 2023)
Dr. Chris Milburn  
A physician, he was fired from the ER for voicing his concerns about COVID-19 policies.  
(Truro: March 16, 2023)

Conclusion  
Long held and codified principles of medical practice were systematically and universally set aside during the COVID-19 pandemic.

The patient-healthcare provider relationship has severely eroded, and it is not clear how, or when, this may be restored. Patients were given false, incomplete, or misleading information, and the political narrative and patently false information was allowed to prevail with little or no push back from the professions.

Political leaders, healthcare regulatory boards, delivery institutions, and individual practitioners violated their fundamental responsibilities to the citizens of Canada in favour of a politically motivated policy that required as many citizens to be vaccinated as possible.

Draconian measures were imposed on the healthcare industry from political and industry players, and by not questioning those policies, the health and wellness of Canadians was severely impacted: many died, many continue to suffer, and there are reports of ongoing vaccine injuries and deaths.

These impacts include death of patients either directly due to due to mandated measures (for example, vaccine) or indirect effects (for example, mental health, suicide, lack of care, and activity).

The most vulnerable members of Canadian society were the most severely affected. Seniors, people with special needs, those requiring healthcare, and children were treated in accordance with centrally dictated policies rather than by healthcare practitioners in the field.

Steps are required to make sure that these overall institutional failures are never allowed to happen again.
Recommendations

A. **A civilian-led detailed investigation** must be carried out to determine who (at all levels) were responsible for these breaches of medical ethics and to recommend criminal investigations as appropriate.

B. **Existing senior members of healthcare regulatory agencies** responsible for the abandonment of long-held and honoured principles of medical care should, as appropriate, stand criminal investigation.

C. **Each province and territory**, including the federal government must establish civilian control and oversight to the existing regulatory agencies, including regularly scheduled and publicly available reviews of their activities. These appointments cannot be politically motivated and should be carried out in public with real input from citizens.

D. **Each Province must Establishment of an office** of the independent Ombudsmen available to both practitioners and patients.

E. **Develop laws making it illegal** to deny elderly residents of care facilities from seeing visitors.

F. **Regulatory Agencies must Enforcement of existing laws** concerning patient confidentiality, requirement for Informed Consent, and the level of care that is required by each healthcare professional.

G. **Establish laws ending centralized control** of individual patient care. Patient care is a matter between a patient and their healthcare provider. This relationship cannot be violated through central government planning edicts. The public health service should never be directing patient care, which is a personal matter between the healthcare provider and the patient.

H. **Ensure that RAW data** is promptly and fully disclosed, eliminating the necessity for Freedom of Information Act (FOIA) requests and associated fees, especially when such requests come from patients or researchers.

I. **Mandatory independent experts** must be added to all panels who are screened for conflict of interest.

J. **There must be a criminal investigation** of the manufacturers and distributors of any of the vaccines that were administered to the public under false and misleading information. If manufacturers and distributors are found to have acted inappropriately, they should bear the costs of these investigations, as well as any damages assessed. The burden of investigation expenses should be placed on the guilty parties.

K. **Ensure Protection for healthcare professionals** and journalists acting in good conscience.

L. **No removal of liability protections** against manufacturers and regulators.
M. **Strengthen the requirement** for healthcare practitioners to independently review and approve of any treatment or procedure that they are recommending to a patient.

N. **Establish an annual requirement** for medical ethics training for all healthcare providers; this should be a career long requirement and may be made up of several modules completed through a multi-year process.

O. **Political figures who are responsible** for the implementation of these mandatory programs must be held accountable in an open and public forum.

P. **All members of the committees** that implemented the mandates must be exposed to the public, including all records of internal discussions and recommendations. An investigation into these actions needs to be carried out and if criminal, unethical, or incompetent actions are identified, punitive actions must be implemented.

Q. **Develop and regularly update comprehensive ethical guidelines** and standards that cover a wide range of medical and healthcare practices, including areas such as consent, confidentiality, end-of-life care, resource allocation, and conflicts of interest.

R. **Ensure that ethical guidelines are widely accessible** to healthcare professionals, patients, and members of the public, fostering transparency and accountability.

S. **Establish and support institutional ethics committees** in healthcare organizations, consisting of diverse stakeholders, including healthcare professionals, ethicists, legal experts, members of the public, and patient representatives. Empower these committees to provide guidance, consultation, and ethical review of complex cases, research protocols, and policy development.

T. **Strengthen practices and policies that ensure patients’ rights** to make informed decisions about their healthcare, including the right to refuse treatment, access their medical records, and participate in shared decision-making.

U. **Promote clear communication** between healthcare practitioners and patients to enhance understanding and respect for patient autonomy.

V. **Safeguard patient confidentiality and privacy** by maintaining strict protocols for the storage, access, and sharing of medical information, in accordance with applicable laws and regulations.

W. **Provide ongoing education and training** to healthcare professionals on the importance of maintaining patient confidentiality and the potential implications of breaches.

X. **Ensure rigorous ethical review processes** for research involving human subjects, promoting Informed Consent, minimizing risks, protecting vulnerable populations, and upholding the principles of beneficence and nonmaleficence.
Y. **Support the work of Research Ethics Boards** (REBs) in reviewing research proposals, monitoring ongoing studies, and ensuring compliance with ethical guidelines.

Z. **Foster a culture of ethical leadership** and professional conduct in healthcare organizations, emphasizing integrity, honesty, empathy, and accountability at all levels.

AA. **Establish mechanisms to address and investigate** ethical misconduct or breaches of professional standards, ensuring appropriate consequences and opportunities for remediation.

BB. **Engage patients and the public in discussions** and decision-making processes related to medical ethics, promoting shared decision-making and incorporating diverse perspectives.

By implementing these recommendations, Canada can maintain and strengthen medical ethics, ensuring the highest standards of patient care, while fostering trust between patients and healthcare professionals and upholding the ethical principles that underpin the healthcare system. Regular review, continuous education, and engagement of stakeholders are vital to address evolving ethical challenges and promote ethical behaviour in the medical field.
7.5.10. Canada’s Vaccine Adverse Reactions Reporting System

Introduction

A robust vaccine adverse reaction reporting system in Canada is crucial to ensure the ongoing safety and efficacy of vaccines. The need for it was particularly acute during the COVID-19 pandemic since the pharmaceutical industry developed an injection that utilized novel technologies.

The basis of these injections was the mRNA technology, which had never before been deployed within the general population. As well, the development and testing of the Pfizer-BioNTech and Moderna COVID-19 injections were completed in less than one year, which is exceptionally rapid for a new type of medical treatment. The normal period of time for the development and testing of new biological drugs and vaccines is between five and ten years.

Furthermore, within that one year time period, not only was the scientific development of the vaccine completed but so was the development of the requisite mass manufacturing processes and facilities.

According to witnesses, a truncated testing of the laboratory-produced vaccines was carried out over a limited two-month test period, and no testing was carried out on the final product from the manufacturing facilities.

The requirement for the manufacturers to demonstrate objective proof of the safety and efficacy of the new product was waived by the Interim Authorization Order. On September 16, 2021, the Minister of Health issued an Interim Order Respecting the Importation, Sale and Advertising of Drugs for Use in Relation to COVID-19. This Interim Order exempted the COVID-19 vaccines from Health Canada’s normal review and approval process.

According to Dr. Peter McCullough, given the characteristics and functions of the mRNA vaccines, they should be classified as biologics, necessitating a significantly greater in-depth testing protocol than traditional vaccines due to the risk of adverse effects.

The Canadian public was never made aware of these issues.

Here are relevant excerpts from it:

Thanks to advances in science and technology, and an unprecedented level of global cooperation, today, Canada reached a critical milestone in its fight against COVID-19 with the authorization of the first COVID-19 genetic vaccine.

Health Canada received Pfizer’s submission on October 9, 2020 and after a thorough, independent review of the evidence, Health Canada has determined that the Pfizer-BioNTech vaccine meets the Department’s stringent safety, efficacy and quality requirements for use in Canada.

As part of its continued commitment to openness and transparency, Health Canada is publishing a number of documents related to this decision, including a high-level summary of the evidence that Health Canada reviewed to support the authorization of the vaccine. More detailed information will be available in the coming weeks, including a detailed scientific summary and the full clinical trial data package.

The press release goes on to insist that

Canadians can feel confident that the review process was rigorous and that we have strong monitoring systems in place. Health Canada and the Public Health Agency of Canada will closely monitor the safety of the vaccine once it is on the market and will not hesitate to take action if any safety concerns are identified.

This section of the report examines the statement by the Government of Canada that they had “strong monitoring systems in place.”

Testimony Concerning Canada’s Vaccine Adverse Reactions Reporting System

Although the discussion of this subject by its very nature is convoluted, it is not necessarily complex. To properly understand the issues surrounding Canada’s vaccine adverse reactions reporting system, one must first understand why such a system was necessary in the case of the COVID-19 injections.

What follows is a discussion of the COVID-19 injections, the process by which they were approved, the evolving definitions used to justify their use, a description of the system that Health Canada told Canadians was in place, and a discussion of the actual system that was in place as described by witness testimony.

In the normal course of events, it is imperative that a rigorous reporting system be available to monitor the safety of any drug administered to the general population.

The “normal course of events” would have included years of laboratory development; peer-reviewed, independent testing; monitoring of any and all adverse events in the various test groups over a number of years to guard against unknown long-term effects; and the proper classification of the new treatment based on the way it acts on and effects the body. Historically, this process takes between 5-10 years, and sometimes more, depending on the nature of the treatment being evaluated.

The safety and efficacy of any treatment must be proven to regulators based on a cost-risk-benefit analysis carried out on objective and independent evaluations prior to its approval for use.

These conditions were not met in the case of the COVID-19 injections.

The COVID-19 injections were exempted from the normal requirement of their objective proof of safety and efficacy, even though these mRNA-type injections had never before been used in the general population. In addition, regulators classified these treatments in such a way that they required less stringent criteria for their approval despite their novelty.

Witnesses testified that these injections should have been classified as a biologic treatment rather than a simple vaccine as well as that the actual definition of a vaccine was revised to include these new and unproven experimental injections.

The primary difference between a biologic and a traditional vaccine lies in their composition, manufacturing process, and mechanism of action. What follows is a breakdown of the distinction between them.

**Biologics:**

Biologics are medicinal products derived from living organisms such as proteins, nucleic acids, cells, or tissues. They can include monoclonal antibodies, recombinant proteins, hormones, growth factors, and gene therapies.
Biologics are manufactured using complex and highly regulated processes that involve living organisms or their components. These processes often require advanced biotechnology techniques, such as cell culture, recombinant DNA technology, or gene expression systems.

Biologics typically act by targeting specific molecules, receptors, or pathways in the body. They can modulate the immune system, inhibit or enhance specific cellular functions, or replace deficient proteins or cells.

The mRNA injections have all of these characteristics and therefore should have been treated and approved as biologics instead of as vaccines.

**Traditional Vaccine:**

Traditional vaccines are typically composed of weakened or inactivated forms of infectious agents, such as viruses or bacteria, or specific components derived from these pathogens. They may also contain adjuvants or additives to enhance the immune response.

Traditional vaccines are produced using well-established techniques, including viral or bacterial propagation, inactivation, attenuation, or extraction of specific components. Some vaccines are also produced using recombinant DNA technology.

The CDC previously had defined a vaccine as

> A product that produces immunity therefore protecting the body from the disease. Vaccines are administered through needle injections, by mouth and by aerosol.

**Key Differences:**

Biologics are more complex in structure and have much more complex manufacturing processes compared to traditional vaccines.

Biologics often target specific molecules, pathways, or cells in the body, whereas vaccines primarily focus on generating an immune response against specific pathogens.

Compared to vaccines, biologics have a broader range of therapeutic applications beyond infectious diseases, which include treatments for cancer, autoimmune disorders, and genetic diseases. Vaccines, in contrast, primarily focus on preventing or treating infectious diseases.

Before the COVID-19 injections, biologics and vaccines followed distinct, separate regulatory pathways. Biologics are typically regulated as biological products, while vaccines have specific regulatory guidelines and requirements.

**Vaccine Definition Changed**

In the years leading up to the declaration of the COVID-19 pandemic, the CDC changed the definitions of *immunization*, *vaccination* and *vaccine* multiple times.
Here is a comparison of some of the changes in these definitions.

**Traditional Definition of a Vaccine:**

The traditional definition of a vaccine referred to a substance that contains weakened or inactivated forms of pathogens (viruses or bacteria) or specific components derived from them. The primary goal of traditional vaccines was to stimulate the immune system, leading to the production of antibodies and the development of immunological memory. This immune response provided protection against subsequent exposure to the actual infectious agent, thereby preventing disease.

In July 2014, the CDC provided the following definition of *immunization, vaccination,* and *vaccine*:

- **Immunization:** The process by which a person or animal becomes protected against a disease. This term is often used interchangeably with *vaccination or inoculation*.
- **Vaccination:** Injection of a killed or weakened infectious organism in order to prevent the disease.
- **Vaccine:** A product that produces immunity therefore protecting the body from the disease. Vaccines are administered through needle injections, by mouth and by aerosol.

**Revised Definition of a Vaccine:**

The current definition of *vaccine* encompasses a broad range of technologies and mechanisms. It includes traditional vaccines as well as a variety of new, experimental treatments, which have no relation to what or how traditional vaccines are developed or affect the body. Presenting them to the public under the familiar and widely trusted definition of *vaccine* disguises their true experimental nature.

Experimental vaccine platforms in the revised definition include

A. **Viral Vector Vaccines:** These use a modified “harmless” virus (the vector) to deliver genetic material from the target pathogen into cells, triggering an immune response.

B. **mRNA Vaccines:** These introduce a small piece of genetic material (messenger RNA) that encodes the production of a specific viral protein. This mRNA is taken up by cells, which then produce the viral protein, triggering an immune response.

C. **Protein Subunit Vaccines:** These contain specific proteins derived from the target pathogen, rather than the whole pathogen. These proteins can, by themselves, elicit an immune response.

D. **DNA Vaccines:** These introduce a small piece of DNA that encodes the production of specific proteins from a targeted pathogen. The cells take up the DNA and produce the viral protein, initiating an immune response.
E. Vector-based DNA/RNA Vaccines: These combine elements of Viral Vector and DNA/RNA technologies to deliver genetic material into cells for protein production and immune stimulation.

The new, revised definition includes various technologies that trigger an immune response, generate immunological memory, and thereby confer protection against specific pathogens. It includes treatments and delivery methods that are new and experimental and had never before been used on the general population, at least in theory.

At the time these treatments were introduced to the general public, there had been no long-term studies to determine the risk they posed.

During the pandemic, the CDC changed and revised the definition of these terms on the fly, adjusting the definition of vaccine in order to include the COVID-19 injections, thereby justifying their introduction despite the lack of long-term safety data.

To illustrate how relevant definitions have changed, the CDC provided the following definition of immunization, vaccination and vaccine in July 2014:

**Immunization:** The process by which a person or animal becomes protected against a disease. This term is often used interchangeably with vaccination or inoculation.

**Vaccination:** Injection of a killed or weakened infectious organism in order to prevent the disease.

**Vaccine:** A product that produces immunity therefore protecting the body from the disease. Vaccines are administered through needle injections, by mouth, and by aerosol.

From May 16, 2018 to September 1, 2021 the CDC used the following definition for immunity, vaccine, vaccination and immunization:

**Immunity:** Protection from an infectious disease. If you are immune to a disease, you can be exposed to it without becoming infected.

**Vaccine:** A product that stimulates a person’s immune system to produce immunity to a specific disease, protecting the person from that disease. Vaccines are usually administered through needle injections, but can also be administered by mouth or sprayed into the nose.

**Vaccination:** The act of introducing a vaccine into the body to produce immunity to a specific disease.

**Immunization:** A process by which a person becomes protected against a disease through vaccination. This term is often used interchangeably with vaccination or inoculation.
This was later revised to the following:

**Immunity:** Protection from an infectious disease. If you are immune to a disease, you can be exposed to it without becoming infected.

**Vaccine:** A preparation that is used to stimulate the body’s immune response against diseases. Vaccines are usually administered through needle injections, but some can be administered by mouth or sprayed into the nose.

**Vaccination:** The act of introducing a vaccine into the body to produce protection from a specific disease.

**Immunization:** A process by which a person becomes protected against a disease through vaccination. This term is often used interchangeably with *vaccination* or *inoculation*.

Rather than ensuring that a novel treatment could satisfy the definition of what a vaccine can do, the CDC adjusted the definition of *vaccine*, tailoring it to suit new technologies developed and promoted by the pharmaceutical industry, which the CDC is supposed to regulate.

The definition of these terms was revised dozens of times between 2014 and 2023.

The revised definitions have blurred the lines between biologics and vaccines. Drugs that can now be called vaccines, like those based on viral vectors or mRNA technology, exhibit characteristics of both traditional vaccines and biologics. The distinction lies in their composition, manufacturing, and mechanism of action.

The above discussion demonstrates how the process that led to the manufacture and development of the COVID-19 vaccines was unlike any drug development or approval process ever before undertaken.

The COVID-19 vaccines were based on novel technologies, which had never been used in the general population before; the process of development and testing was shortened from 5-10 years to a year or less; the key requirements of the approval process related to safety and efficacy were set aside; long term testing on population groups approximating the general population were never done; and the very definition of what the drugs were and supposed to do, kept changing.

These and many other issues contributed to an unprecedented level of risk and uncertainty with these new drugs.

The need to have a robust safety monitoring system was extreme.

Safety issues related to the development, manufacturing, and distribution of prescription drugs can arise from various technological, manufacturing, and distribution factors. Here are some key areas where safety concerns may arise:
Technological Issues:

A. Formulation and Stability: Inadequate understanding of the drug’s chemical properties or formulation can lead to stability issues, resulting in reduced efficacy or potential safety risks.

B. Drug-Device Interactions: If a drug requires specialized delivery devices or technologies, compatibility issues between the drug and the device can arise, affecting drug effectiveness and patient safety.

C. Nanotechnology and Biologics: Advancements in nanotechnology and biologics have introduced complex manufacturing processes and potential safety concerns due to their unique characteristics and potential interactions with the human body.

Manufacturing Issues:

A. Contamination and Cross-Contamination: Improper handling or contamination during the manufacturing process can introduce impurities, foreign substances, or microbial contaminants, compromising the drug’s safety and quality.

B. Quality Control and Assurance: Insufficient quality control measures or inadequate adherence to Good Manufacturing Practices (GMP) can lead to inconsistencies in drug potency, purity, or dosage, posing risks to patients.

C. Scale-up Challenges: Transitioning from laboratory-scale production to commercial-scale manufacturing may introduce unforeseen safety issues if the process is not properly optimized or validated.

Distribution Issues:

A. Counterfeit Drugs: Illegitimate or counterfeit drugs can enter the distribution chain, potentially lacking active ingredients, containing harmful substances, or having incorrect labelling, leading to patient harm.

B. Storage and Transportation: Inadequate storage conditions, temperature excursions, or mishandling during transportation can compromise drug integrity and efficacy, impacting patient safety.

C. Supply Chain Integrity: Complex global supply chains increase the risk of drug diversion, unauthorized tampering, or substitution, compromising the safety and authenticity of the medication.
Post-Marketing Surveillance:

A. Adverse Drug Reactions (ADR): Even after thorough premarket clinical trials, some adverse reactions may only emerge once a drug is widely used. Robust post-marketing surveillance systems are crucial for detecting and monitoring ADRs to ensure timely intervention and patient safety.

B. Labelling and Risk Communication: Inaccurate or insufficient drug labelling, which include warnings, contraindications, and precautions, can lead to improper use, misunderstandings, or increased safety risks for patients and healthcare providers.

To address these safety issues, regulatory bodies like Health Canada are tasked with establishing and enforcing stringent regulations and guidelines.

Pharmaceutical companies are also responsible for implementing quality management systems, conducting thorough risk assessments, and continuously monitoring and improving their manufacturing processes to ensure drug safety.

Collaborative efforts between regulatory agencies, manufacturers, healthcare professionals, and the public are essential to minimize safety risks associated with prescription drugs and ensure the highest possible level of patient safety throughout the drug development, manufacturing, and distribution lifecycle.

The most important part of a safety monitoring system must engage areas of society which will be subjected to the new drug. This includes patients, healthcare providers, pharmacies, regulators, and the manufacturers themselves.

Following are the goals of a functioning adverse events monitoring system:

Safety Monitoring: Vaccines undergo testing before they are approved for public use, but monitoring their safety post-approval is equally important. A reporting system allows healthcare professionals and individuals to report any adverse reactions they observe after vaccination.

By collecting and analyzing this data, health authorities can identify potential safety concerns, evaluate the risks versus benefits, and take necessary actions to protect the population.

Early Detection of all Side Effects: In a completely new drug based on a never-before-implemented technology utilizing a highly complex manufacturing process, it is impossible to predict beforehand exactly what level and types of adverse events may occur in the diverse general population. A comprehensive reporting system helps identify and investigate all side effects that may not have been detected during the initial clinical trials due to limited sample sizes. Early detection enables swift responses, which includes further investigation, changes in vaccination strategies, or updates to vaccine recommendations.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

This is especially important for COVID-19 injections as no mid-term or long-term testing was carried out prior to approval for use in the general population.

Building Public Trust: Transparent and effective monitoring of vaccine adverse reactions helps build public trust in vaccination programs. When people have confidence that their concerns are being acknowledged, investigated, and acted upon, they are more likely to participate in adverse events reporting efforts. A robust reporting system assures the public that their safety is a priority and that the healthcare system is committed to addressing any potential risks associated with vaccines.

Data-driven Decision Making: Accurate and timely reporting of adverse reactions provides valuable data for decision-making processes. Health authorities can analyze the reported cases to understand the characteristics of adverse reactions, such as their frequency, severity, demographics, and potential risk factors. This data can inform vaccine recommendations, guide public health policies, and support regulatory decisions regarding vaccine safety.

Continuous Vaccine Improvement: A reporting system facilitates continuous monitoring and improvement of vaccines. By collecting information on adverse reactions, health authorities can identify patterns, assess the effectiveness of existing vaccines, and guide the development of future vaccines. This knowledge helps researchers and manufacturers make necessary adjustments to vaccines to enhance their safety profiles and minimize potential side effects.

Global Collaboration: Adverse reaction reporting systems also contribute to international collaboration and information sharing. By participating in global networks, Canada can share its data and benefit from the experiences and knowledge of other countries. This collaboration strengthens global vaccine safety monitoring efforts and enables the identification of potential adverse events that may be specific to certain populations or regions.

The need for a robust vaccine adverse reaction reporting system in Canada is essential for monitoring vaccine safety, detecting all side effects, building public trust, making data-driven decisions, improving vaccines, and facilitating global collaboration. It serves as a critical tool in ensuring the ongoing success of vaccination programs and protecting the health of the population.

What the Adverse Events Monitoring System was Supposed to Be
In Canada, vaccine safety monitoring is supposed to be conducted through various mechanisms and systems. Below are some key components of vaccine safety monitoring in Canada:

A. Canadian Adverse Events Following Immunization Surveillance System (CAEFISS):

- CAEFISS is also known as the Canadian Immunization Monitoring Program.
- Active (IMPACT) is a national surveillance program for monitoring adverse events following immunization (AEFIs) in children. It collects AEFI data from 12 pediatric tertiary care centres across Canada and analyzes the data to identify patterns, trends, and potential safety signals related to vaccines.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

B. Vaccine Adverse Event Reporting System (VAERS) United States:
   - VAERS is a national passive surveillance system that allows healthcare providers, vaccine manufacturers, and the public to voluntarily report adverse events following immunization.
   - It serves as an important tool for detecting and monitoring potential safety concerns associated with vaccines.

C. Provincial and Territorial Vaccine Safety Surveillance:
   - Each Canadian province and territory has its own vaccine safety surveillance system, which monitor and investigate adverse events related to vaccines administered within their jurisdictions.
   - These systems contribute to the overall vaccine safety monitoring efforts in Canada.

D. Vaccine Safety Research and Studies:
   - Canadian researchers conduct studies and research projects to investigate vaccine safety concerns, assess the effectiveness of vaccines, and monitor long-term safety outcomes.
   - These studies often involve collaborations with academic institutions, healthcare providers, and government agencies.

E. Collaboration with International Vaccine Safety Networks:
   - Canada actively participates in international collaborations and networks, such as the World Health Organization’s Global Vaccine Safety Initiative and the Vaccine Safety Datalink in the United States.
   - These collaborations facilitate the exchange of information, including the sharing of best practices, and joint investigations of vaccine safety issues.

F. Regulatory Oversight and Post-Market Surveillance:
   - Health Canada, the federal regulatory agency, oversees the approval and ongoing monitoring of vaccines.
   - Health Canada conducts post-market surveillance activities to monitor the safety of vaccines after they are approved and distributed.
   - It collaborates with provincial and territorial health authorities, healthcare professionals, and other stakeholders to ensure comprehensive vaccine safety monitoring.
G. Adverse Event Following Immunization (AEFI) Reporting:

- Healthcare providers are responsible for reporting any adverse events following immunization to the local public health authorities or relevant surveillance systems.

- Timely and accurate reporting of AEFIs is crucial for monitoring and investigating potential safety concerns.

Through these mechanisms, Health Canada claims to ensure continuous vaccine safety monitoring, early detection of potential adverse events, and prompt response to emerging safety concerns.

Health Canada also claims that their regular data analysis, collaboration, research, and regulatory oversight play significant roles in maintaining a robust vaccine safety monitoring system in the country.

The system described above, certainly sounds like the robust safety monitoring system that Health Canada reassured Canadians that they had in place to protect Canadians.

The reality of the system on the ground, as described by the testimony of witnesses, was that of a broken, impossible to use system, with gate-keepers who prevented accurate and timely reporting of adverse events.

The Broken Monitoring System Canadians Got

The entire adverse events reporting and monitoring system has a fatal flaw: it relies only on reports of adverse events received by healthcare professionals. Furthermore, these reports were discouraged, hindered, and rejected by local public health officers, and healthcare professionals were punished for reporting adverse events.

Patient Reporting of Adverse Events

Patients are not able to directly report adverse events to the CAEFISS reporting system. These reports must be funnelled through the healthcare providers.

According to Health Canada:

- CAEFISS reports are submitted by public health authorities in provinces and territories, who in turn receive them from local public health units. Provincial and territorial authorities also receive reports from federal authorities that provide immunization within their jurisdiction, including:
  - the RCMP,
  - Indigenous Services Canada, and
  - Correctional Service Canada.
Most of these reports are generated by nurses, physicians, or pharmacists who provide immunizations or who care for individuals with AEFIs. AEFIs received by National Defence and the Canadian Armed Forces are reported directly to PHAC.

Several witnesses testified that healthcare providers would outright deny or even refuse to consider claims of adverse reactions.

Concerns from patients related to adverse reactions were played down or dismissed by doctors, despite the fact that since the mRNA vaccines were a new technology, healthcare professionals could never have known, for certain, what issues might present in patients.

Based on the incredibly fast and unique method that was used to approve both the vaccines and their manufacturing processes, it was highly possible that even if the basic technology of these novel vaccines was safe, any variety of adverse events might occur as a result of the manufacturing, distribution, handling, or injection of these drugs.

It is unbelievable that healthcare workers would simply dismiss patient claims when considering the dozens of mechanisms and potential issues with these drugs.

Some witnesses reported that when they had experienced an adverse reaction to the injection, their own doctors told them they would not report it as an adverse reaction due to fear of reprisal or ridicule.

Nurse Angela Taylor described how she had experienced a severe reaction to the COVID-19 Injection. Doctors not only refused to report the event but also tried to coerce her into taking a 2nd and 3rd injection.

Kristin Ditzel experienced a severe reaction to the injection within 25 minutes of receiving the shot but was told her reaction was not due to the vaccine.

**Healthcare Workers Reporting of Adverse Events**

Many physicians testified that they had been prevented from or punished for reporting adverse reactions to the COVID-19 injections.

Dr. Patrick Phillips testified that he had reported five adverse events due to vaccine and the public health officer had rejected all of them, without explanation. A complaint to the regulator against Dr. Phillips was made due to the submission of these adverse event reports. The public health officer did not actually see any of the patients.
Dr. Patrick Provost testified that none of his five vaccine adverse events (VAEs) to the mRNA-LPN injection were reported by his treating endocrinologist. One reaction was an exacerbation of his type-1 diabetes that he managed to control himself by fine-tuning his insulin dosing. Not only did his endocrinologist refuse to report his VAEs, but he also refused to provide him an exemption for his second dose, arguing that the issue with complication of his type-1 diabetes was now under control with proper dosing of insulin.

When Patrick managed to find a healthcare worker who reported his VAEs to the INSPQ (Institut national de santé publique du Québec), he was told by a nurse from the INSPQ, that some of his VAEs were not going to be recorded as they happened six weeks after vaccination, which is the accepted window for traditional vaccines.

Dr. Provost then did a large retrospective analysis of VAEs as monitored by patients’ modifications to their drug prescriptions. In his study, published in the peer-reviewed journal IJVTPR (International Journal of Vaccine Theory, Practice, and Research) on January 2023, he discovered that the six weeks’ window is too short as 75 per cent of VAEs occurred after six weeks.

In a second study published in IJVTPR, based on two cases studies of unreported VAEs, he identified up to 40 obstacles of reporting VAEs properly. He also showed that underreporting of VAEs is really the blind spot of the COVID-19 vaccination campaign. Dr. Provost said that we knew before the COVID-19 vaccination that the underreporting factor was at least 10, but we now realized that it’s more than 40–100.

Dr. Dion Davidson testified that he had difficulty trying to fill out the online form to report to the adverse events reporting system. He indicated that making a report would take upwards of 45 minutes to do, so most healthcare workers would not do it.

Testimony from first responders detailed that the type of calls for help changed significantly once the vaccines were rolled out to the public and that no reporting of those events as adverse reactions to the COVID-19 injections was carried out.

Dr. Chong Wong testified that he told one of his patients that she should not take any more COVID-19 injections, after she developed blood-clots following the first injection. The patient had been contacted by and told by the public health nurse to take the second shot despite the adverse reaction. The public health nurse had not actually seen the patient or Doctor Wong prior to her giving this advice to the patient.

Dr. Gregory Chan further stated that as of May 2021, he and his colleagues could not use the federal reporting system, so he started to use the Alberta provincial system, Adverse Events Following Immunization (AEFI).
Dr. Gregory Chan testified that he could not navigate the provincial reporting site and could not actually make reports on the website. He finally printed the forms and filled them out manually. He had made 56 reports of adverse reactions due to the COVID-19 injections. He reported that of the 56 reports, he received no acknowledgment from public health on approximately half of them; of the second half of the 56 reports, six were accepted into the system, six were rejected, and nine have not been addressed.

Of the 28 reports acknowledged by Alberta Health, public health advised 16 of them to get the next injection, despite not having actually seen any of these patients.

Dr. Chan reviewed the online criteria systems as set out by Alberta Health and confirmed his 56 reports qualified as adverse reactions as defined by the website.

Dr. Chan further testified that as of May 2021, he and his colleagues could not use the federal reporting system. He reported that five months into the rollout of the vaccines, the CAEFISS system was frustrating as it went from link to link resulting in him having to print off a form to complete by hand.

Dr. Justin Chin testified that both patients and doctors were failing to identify adverse events caused by COVID-19 vaccinations.

Nurse Serena Steven experienced a severe adverse reaction within one hour of receiving the injection, was sent home from the emergency room, and no report of the adverse event was made by medical staff.

Dr. Charles Hoffe noticed significant issues in his patients and sent a private email to 18 of his colleagues questioning if any of them were seeing any of these issues. One of these 18 doctors sent the email to the regional health authorities, who called him in for a meeting; he was told that he was putting patients at risk by questioning the injections.

A complaint was filed with the College of Physicians and Surgeons, and he was told not to discuss any of this with any of his colleagues. He was directed to pose any future questions to the public health officer. Dr. Hoffe noted significant neurological issues in his long-time patients, so he sent a letter to the medical health officer asking for assistance. There was no response, and his letter was forwarded by the public health officer to the College of Physicians and Surgeons as a new complaint against him.

Dr. Hoffe was referred to a vaccine safety specialist who claimed that Dr. Hoffe’s observations were incorrect, although she had not seen any of his patients. He was told he should make an adverse reactions report but that these reports would not trigger an investigation.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Dr. Rene Lavigueur testified that if he told the truth about adverse reactions, he was in conflict with public health and at risk of losing his licence. He said he was being forced to simply follow orders. He filled out 16 adverse events reports, but everyone else was too afraid to do it or to even speak about it. He had patients come to him to say their regular doctor had refused to report their adverse events.

Dr. Lavigueur stated that the public health officials were evaluating the reports of COVID-19 vaccine injuries based on checklists that had been developed with regard to traditional vaccine reactions, failing to understand that COVID-19 injections were not traditional vaccines.

Conclusions
Based on the high level of risk associated with the development, manufacture, and distribution of the novel COVID-19 injections, it was extremely important that any reporting system was designed to collect and examine all reports of alleged vaccine injuries.

Such a system would have to be open to everyone who is affected by the vaccines, including patients, and the system would have to be readily available and easy to interact with.

Healthcare professionals should have been encouraged to report their findings, and all reports should have been entered into the overall system without filtering by frontline staff or public health officials.

The adverse events reporting system, with the exception of the pediatric system, is not only based on a passive reporting model, but healthcare providers were also actively being discouraged from making these reports. Some physicians were reprimanded by their regulators, and others lost their jobs or lost their licence for reporting adverse events.

The system utilized to report adverse events due to COVID-19 injections has failed for a wide range of reasons: some are functional shortcomings in the system; other reasons include willful dismissal of the data and an unwillingness to acknowledge that the initial expectations and analysis were in error. More specifically the problems include:

Underreporting: Like many passive surveillance systems, the adverse event reporting system relies on healthcare professionals voluntarily reporting AEFIs. Underreporting remains a challenge, leading to potential gaps in data and an incomplete understanding of vaccine safety profiles.

Based on the testimony of many witnesses, doctors were actively discouraged and punished for reporting adverse events.

Representativeness: The data collected by the system primarily came from a very limited number of healthcare professionals who had the courage to report. This data cannot be expected to fully capture adverse events experienced by the broader population.
Data Quality and Standardization: Ensuring consistent data collection methods and standardized reporting is essential to improve data quality and comparability. Efforts should be made to streamline data collection and harmonize reporting practices across different sites.

Vaccine Hesitancy and Misinformation: Instead of listening to what doctors and patients were reporting, public health officials decided to categorize many of these injuries as being related to vaccine hesitancy and misinformation, which impacted reporting rates and the overall perception of vaccine safety.

Timeliness: Prompt reporting and analysis of AEFIs are crucial for timely identification and response to potential safety concerns. Ensuring efficient data collection, analysis, and dissemination of findings is needed to address delays and improve the timeliness of vaccine safety monitoring.

Recommendations
To improve the vaccine adverse reporting system, several recommendations must be considered:

**A. Enhance Healthcare Provider Education and Awareness:**
- Provide comprehensive education and training to healthcare providers on the importance of adverse event reporting, including the recognition and reporting of vaccine-related adverse events.
- Streamline the reporting process to make it more user-friendly and efficient.
- Provide mandatory ongoing education of public health officials to provide insights into the risks associated with novel drug implementation so that they understand the difference between traditional vaccine-type medications and new biologic medications.
- Ensure that on the release of any new drug that all parties involved with the administration or monitoring are fully aware of the actual nature of the drugs under consideration. Some of the shortfalls in the system during COVID-19 had to do with a lack of understanding concerning the nature of these injections.
- Provide re-education for colleges of physicians and surgeons across Canada on the principle behind procedures required and the importance of the adverse event monitoring system.

**B. Promote Public Awareness and Engagement:**
- Launch public awareness campaigns to educate the general public about the importance of reporting vaccine adverse events.
- Provide accessible information on how and where to report adverse events, emphasizing the role individuals play in vaccine safety monitoring.
- Provide a portal through which patients can directly report their alleged vaccine injuries to the system.
• Encourage vaccine recipients and caregivers to report any adverse events they observe following vaccination.

C. **Improve Reporting Infrastructure:**

• Develop user-friendly online reporting platforms or mobile applications to simplify and streamline the reporting process for healthcare providers and the public.

• Ensure reporting mechanisms are easily accessible, with clear instructions and options for reporting adverse events, including user-friendly interfaces and multilingual support.

D. **Implement Active Surveillance Systems:**

• Augment passive surveillance systems with active surveillance components to actively identify and monitor adverse events, especially rare or serious events that may be missed through passive reporting alone.

• Augment passive surveillance systems with active surveillance components to actively identify and monitor patient complaints and trends or patterns of patient complaints following a drug rollout.

• Implement proactive strategies, such as automated electronic health record data mining, to identify potential safety signals and conduct targeted investigations.

E. **Strengthen Collaboration and Data Sharing:**

• Foster collaboration between different stakeholders, including healthcare providers, public health agencies, vaccine manufacturers, and research institutions, to facilitate seamless data sharing and exchange of information.

• Immediately end the practice of public health officials directly contacting patients and advising them to undertake medical procedures contrary to the attending physician’s instructions.

• Enhance integration between national and international vaccine safety networks to leverage collective expertise, share best practices, and collaborate on investigations of global vaccine safety concerns.

F. **Ensure Timely Analysis and Communication of Findings:**

• Prioritize timely analysis of reported adverse events to identify potential safety signals promptly.

• Ensure that those evaluating the data are capable of recognizing and analyzing the data, despite their professional biases.
• Ensure clear and transparent communication of findings to healthcare providers, the public, and other relevant stakeholders, while considering the balance between timely communication and the need for thorough investigation.

G. Continuous Evaluation and Improvement:

• Regularly assess the performance and effectiveness of the reporting system, including feedback from healthcare providers, the public, and other stakeholders, to identify areas for improvement.

• Incorporate advancements in technology and data analytics to enhance the efficiency and accuracy of adverse event reporting and analysis.

By implementing these recommendations, the vaccine adverse reporting system can become more robust, efficient, and responsive, leading to improved vaccine safety monitoring and better protection of public health.
7.5.11. Delivery of Healthcare Services During the Pandemic

Introduction

The announcement of the COVID-19 pandemic in late 2019 and the subsequent imposition of non-pharmaceutical interventions had a profound impact on all aspects of society, with the healthcare system being one of the most severely disrupted sectors.

As a result of the country-wide media/propaganda campaign, citizens were unduly alarmed and terrorized at the prospect of a novel coronavirus. This terror permeated all of society including healthcare professionals.

False information propagated by government agencies led Canadians to believe they were facing the most dangerous pandemic since the Spanish flu pandemic of 1918. It could be argued that in the very early part of 2020, healthcare officials did not yet understand the nature of the virus; however, based on the statistics being published by Health Canada, by the end of March 2020, healthcare officials already understood who was at risk and who was not at risk from COVID-19.

Governments, healthcare providers, and patients worldwide were forced to grapple with numerous challenges and adapt to new realities brought about by the interventions imposed by the governments.

Furthermore, public health officials were given control over planning for and execution of the government’s emergency response. Public health officials are not experienced in, or trained to undertake, the massive task of first understanding a potential emergency of this magnitude and taking the appropriate steps to deal with it. This inexperience and incompetence was evident from the very beginning of the pandemic.

The main goal of public health officials in designing and implementing the pandemic response was to protect the “healthcare system”. The goal of the response should have been to protect/minimize the effects of the COVID-19 pandemic on the “public”.

This fatal flaw in setting the wrong strategic goal for the pandemic response resulted in major disruptions in service, the misallocation of resources, plus the unnecessary terrorizing of an entire population.

Major disruptions to the delivery of healthcare in Canada were the result of these and many more failures.

Testimony Concerning the Delivery of Healthcare Services During the Pandemic

Quickly after the imposition of the public health officials’ mandates, large areas of the healthcare system began to shut down.
Sections of hospitals designated as “non-essential” were closed down, and staff were allocated to
emergency care and ICU areas, waiting for the predicted wave of COVID-19 cases, which never
came. Witnesses reported that prior to COVID-19, the emergency rooms were extremely busy, and
following the imposition of the lockdown and mandates, the emergency rooms were empty and
staff were idle; staff not allocated to these areas were sent home.

What were deemed to be “non-essential” procedures, tests, and treatments were cancelled and/or
postponed indefinitely.

Some patients who were injured or developed medical conditions refused to go to the hospital or
see their doctors out of fear. Some people did not go to the hospital because the media had been
telling them that hospitals were overwhelmed with COVID-19 cases; that was untrue, based on
testimony..

Routine office-based medical services were also temporarily halted. Many doctors were afraid to
see patients. According to witness testimony, some doctors refused to see patients, and others
attempted to meet with patients over the phone.

When vaccines became available, an entirely new and cruel set of issues presented themselves. The
terror and hatred that appeared to have been so carefully cultivated by certain politicians and
mainstream media, set those who were injected against those who chose not to be injected.

Witnesses stated that patients presenting themselves in emergency rooms were treated with
disrespect and, in some cases, distain. Witnesses, both patients and staff, described a toxic
atmosphere of hate and bullying. Patients who were not injected were isolated, labelled, and in
some cases refused medical attention.

As the government responses extended to forced vaccinations, staffing shortages began to arise.
Hundreds, if not thousands, of staff who were now being forced to get the injection or loose their
jobs, resigned, quit, took early retirement, or were fired.

At a time when the media was telling Canadians that there was a shortage of healthcare
professionals, they were covering up the fact that the government’s own policies were in fact
causing those shortages to occur. Often the system lost the most experienced and knowledgeable
staff members to early retirement.

What the government was further keeping from the public was that prior to and leading into the
pandemic, there were chronic shortages of staff and resources already.

The pandemic response also affected healthcare in a number of other ways: through disruption of
supply systems and through the creation of shortages of all types of necessary supplies, including
personal protective equipment.

Finally, there was the enormous reallocation of equipment, facilities, staff, and financial resources
into the mandated testing and vaccination program.
Since the healthcare officials already knew what segment of the population was at risk to COVID-19, they should also have focused their attention on that specific segment of the population.

Based on the data provided by the vaccine manufactures to Health Canada, it was obvious that the vaccines were not effective in protecting people from the infection, and the safety profile of the vaccines was unknown. Furthermore, no testing had been carried out to determine if the injections actually prevented or reduced the spread of the disease.

Based on all of these known facts, implementing a universal testing and vaccination program was pointless, at best, and potentially life threatening to Canadians.

Among these disruptions, three major issues stand out: the postponement of regular treatments, patient fear of hospitals, and the shutdowns of elective surgeries.

**Postponement of Regular Treatments:**

One significant disruption to the healthcare system caused by COVID-19 measures is the postponement or cancellation of regular treatments for non-COVID-related conditions.

As the government implemented their pandemic policies, healthcare facilities were refocused to deal with a predicted overwhelming influx of COVID-19 patients, which never came. This resulted in a shutdown or slowdown on resources such as hospital beds, medical equipment, and healthcare personnel. Hospitals had to repurpose resources and prioritize the care of predicted COVID-19 patients, often leading to the postponement of non-urgent procedures and treatments.

This delay had serious consequences for patients suffering from chronic illnesses, such as cancer, cardiovascular diseases, and other conditions, potentially leading to disease progression, reduced quality of life, and even increased mortality rates.

**Patient Fear of Hospitals:**

Another significant disruption resulting from the fear propagated by the government and media was the widespread fear and hesitancy among patients to seek medical care in hospitals and healthcare settings. The government and media had exaggerated the contagious nature and lethality of the virus. This coupled with the uncertainty surrounding its transmission initially led to a general perception that hospitals were high-risk environments for contracting COVID-19.

Fearful of exposure, many individuals with health concerns opted to delay or altogether avoid seeking medical attention, even for urgent conditions. This fear resulted in a decline in routine check-ups, preventive screenings, and early detection of diseases, which could lead to long-term health consequences as undiagnosed conditions progress untreated.
**Shutdowns of Elective Surgeries:**

Elective surgeries, which are planned procedures that are not immediately life-threatening but necessary for patients’ wellbeing, have been significantly disrupted by the COVID-19 response. To preserve resources, minimize the risk of exposure to the virus, and ensure sufficient capacity to handle COVID-19 cases, many healthcare systems implemented temporary shutdowns or restrictions on elective surgeries. This measure aimed to redirect medical staff, equipment, and hospital beds to COVID-19 response efforts.

This strategy resulted in substantial backlogs of elective procedures, negatively impacting patients who required surgeries for conditions such as joint replacements, cataracts, and hernias. The delays in these surgeries have caused prolonged suffering, decreased quality of life, and increased wait times for those in need of essential care.

This strategy was the direct result of the incorrect planning of the pandemic response. In other words, the response was designed to protect the healthcare system, it was not designed to protect patients.

**Conclusion**

The government’s response to the COVID-19 pandemic has disrupted the healthcare system in various ways, including the postponement of regular treatments, patient fear of hospitals, and the shutdown of elective surgeries. These disruptions have had severe consequences for patients, leading to disease progression, decreased preventive care, and increased wait times for necessary procedures.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Recommendations

Based on the experience of the COVID-19 pandemic in Canada, several recommendations could be made to improve the healthcare system and prevent similar disruptions to normal healthcare services in the future.

These recommendations focus on building resilience, preparedness, and adaptability in the healthcare system. Here are some key suggestions:

A. **Ensure Proper Emergency Response, Planning, and Implementation:** Public health officials are not trained in the planning and implementing of national integrated emergency response to major public health emergencies. In future, the responsibility for planning and implementing such emergency plans must be undertaken by the emergency measures organizations that already exist for this purpose. Public health must play an active role as technical consultant to the Emergency Measures apparatus but should never be placed in control of it.

B. **Invest in Healthcare Infrastructure:** Strengthen the healthcare infrastructure by first rationalizing the current inventory and capacity of the system, and then increasing the capacity of hospitals, clinics, and healthcare facilities, if required. This may include investing in more beds, medical equipment, and essential supplies to handle potential surges in patient volumes and designating alternative facilities and mechanisms to share resources across provincial jurisdictions.

C. **Enhance Telehealth Services:** Expand and promote telehealth services to provide virtual consultations and healthcare support. Telehealth can reduce the burden on physical healthcare facilities, increase accessibility to healthcare services, and ensure continuity of care during emergencies.

D. **Improve Data Collection and Analysis:** Establish a robust data collection and analysis system to monitor healthcare resources, disease outbreaks, and public health trends. Timely and accurate data can help inform evidence-based decision-making and resource allocation during crises.

E. **Maintain Strategic Stockpiles:** Create and maintain strategic stockpiles of essential medical supplies, including personal protective equipment (PPE), ventilators, and medications. These stockpiles can help mitigate shortages during emergencies and protect healthcare workers.

F. **Support Healthcare Workforce:** Ensure the wellbeing and resilience of healthcare workers by providing mental health support, appropriate training for handling emergencies, and fair compensation. A strong and supported workforce is crucial in times of crisis.

G. **Improve Collaboration and Communication:** Enhance coordination and communication between federal, provincial, and territorial governments, as well as with healthcare providers and public health agencies. Effective communication channels can facilitate rapid response and the dissemination of critical information.
H. **Pandemic Preparedness Plans**: Develop and regularly update comprehensive pandemic preparedness plans at all levels of the healthcare system. These plans should outline specific strategies and protocols for managing various types of pandemics and health emergencies.

I. **Training and Dissemination of Plans**: As seen during the COVID-19 pandemic, existing plans were sidelined and many healthcare workers were not aware of the existence of any plans. Emergency plans must be distributed widely and reviewed with healthcare workers at all levels, and the public should have access to seminars and information sessions. The best plan in the world if unseen and unrehearsed is useless.

J. **Public Health Education and Awareness**: Strengthen public health education and awareness programs to inform the general population about disease prevention, natural immune system upkeep, and appropriate healthcare-seeking behaviour during outbreaks.

K. **Supply Chain Resilience**: Diversify and strengthen the supply chain for essential medical equipment and pharmaceuticals to reduce dependence on foreign suppliers and minimize disruptions during global crises.

L. **Regional Response Capacity**: Establish regional response capacities to handle healthcare crises, allowing for more focused responses in areas heavily affected by outbreaks while maintaining healthcare services in other regions.

M. **Long-Term Care Facilities**: Implement improved infection control measures in long-term care facilities to protect vulnerable populations during outbreaks and prioritize their healthcare needs.

N. **Flexible Healthcare Services**: Develop flexible healthcare service models that can quickly adapt to changing circumstances. This could involve creating mobile healthcare units, flexible staffing arrangements, and alternative care facilities during emergencies.

Implementing these recommendations requires a collective effort from governments, healthcare providers, communities, and individuals. By learning from the challenges faced during the COVID-19 pandemic and taking proactive measures, Canada can enhance its healthcare system’s resilience and better protect the health and wellbeing of its citizens in the face of future health emergencies.
7.5.12. Public Workplaces and Pandemic Measures

Introduction

Canadian Blood Services (CBS) is a not-for-profit, charitable organization that operates independently from government. Created through a memorandum of understanding between the federal, provincial, and territorial governments, CBS was established in 1998. Funding comes primarily from the provincial and territorial governments.

CBS identifies the organization as one part of Canada’s broader network of healthcare systems. It is the only national manufacturer of biological products funded by Canada’s provincial and territorial governments. CBS provides blood and plasma, as well as transfusion and stem cell registry services, on behalf of all provincial and territorial governments (excluding Québec). CBS national transplant registry for interprovincial organ sharing and related programs extends to all provinces and territories. CBS works closely with Hema-Québec in times of need.

CBS is responsible for the safety, quality, identity, purity, potency, and accessibility requirements of all blood products and services offered.

From its website, CBS is “committed to reflecting Canada’s population in our organization and fostering an environment where all employees can be their authentic selves, with equal opportunities to succeed and contribute.”

In relation to COVID-19, CBS in June 2020 formed a research partnership with the COVID-19 Immunity Task Force (CITF), a research arm of the Public Health Agency of Canada. Since then, more than 720,000 blood samples have been analyzed and tested under CBS’ seroprevalence study to determine whether donors have developed an immune system response to COVID-19 through infection or vaccination. CBS reports the results indicate that more than 78 per cent of blood donors have antibodies due to COVID-19 [infection] and 100 per cent have antibodies as the result of vaccination. CBS attributes these results to the high uptake of vaccination as well as the extent to which COVID-19/SARS-CoV-2 has spread throughout the population of adult blood donors.\(^{147}\)

Witness Testimony

Jessica Kraft (Day 3, Winnipeg, MB) is a 31-year-old with two daughters. She began her employment journey with Canadian Blood Services in October 2013. Ms. Kraft received six weeks of classroom and on-the-job training. She enjoyed her role as a Donor Care associate. Ms. Kraft’s clinical responsibilities included needle insertion (phlebotomy) and donor screening procedures.

\(^{147}\) Canadian Blood Services, June 20, 2023, Ottawa, ON Link: https://www.blood.ca/en/about-us/media/newsroom/blood-donors-are-helping-us-prepare-future-pandemics (accessed July 14, 2023)
In December 2019, Ms. Kraft gave birth to a second daughter. Consequently, she went on maternity leave. She returned to work in March 2021 following the implementation of workplace safety protocols for COVID-19. Mandates included the wearing of masks by staff and donors, social distancing protocols, the introduction of wellness checkpoints within the clinic, and ensuring donors were in good health before they came into the facility.

When she first started with Canadian Blood Services, she found the environment to be a fun and a supportive place to work. Her colleagues formed a good team. She noted that while she was on parental leave, there was a change in management. This in turn led to a push for more first-time donors. Other notable clinic changes included the exclusion of family and friends attending the clinic to support donors and the lack of refreshments for donors after donating whole blood, plasma, or red blood cells (which is critically important to ensuring the donor’s health). On a broader level, Ms. Kraft noted a change in how CBS portrayed itself as an institution—from a non-profit contributing to the health needs of Canadian patients to being labelled a biologics manufacturing company.

As well, Ms. Kraft observed the clinic had become rigid and sterile. There was an increase in donor reactions (donors feeling faint and/or passing out). However, during this time, there were no specific changes in her job description or the way she collected blood.

In September 2021, Canadian Blood Services posted a mandatory vaccine notice to employees. Under the new mandate, requirements included attesting one’s vaccination status to the employer and submitting to regular rapid tests. Employees were required to be fully vaccinated by late fall. There was an option for applying for medical or religious exemption. Ms. Kraft pursued an exemption.

When she went to see her physician for a regular checkup, she mentioned the new healthcare worker mandate. The doctor dodged Ms. Kraft’s questions about getting an exemption for her condition. Ms. Kraft has a pre-existing medical condition known as functioning heart murmur. Her doctor denied her heart condition, a diagnosis she has had for her whole life. Ms. Kraft’s medical doctor would not give her an exemption for two reasons. First, the exemption would have to be cleared by other physicians and second, even if she did provide a medical exemption, it would likely not be approved by Ms. Kraft’s employer.

She then tried to get permission for exemption from Canadian Blood Services. She approached her immediate supervisor, managers, and the CBS doctors on-site with questions. In response, she received a lot of copy-and-paste-type statements and impersonal email replies. At work, she was asked publicly if she planned to get vaccinated. This same question was posed in front of donors. Feeling awkward, Ms. Kraft would change the subject.

Ms. Kraft reiterated she was not opposed to vaccines. She was up to date on all her other vaccines. Her children were vaccinated.
Ms. Kraft testified that even though she knew disciplinary action was coming, she was still devastated when it happened. What caused the decision to be so difficult? Ms. Kraft objected to disclosing personal and private health information to her employer and subsequently having to submit to regular rapid testing. She cited the Personal Health Information Act as justification for not attesting. The Act states employees are not required to disclose personal health information to employers. Regarding the testing requirement, she didn’t think it set a good precedent in the workplace. Ms. Kraft was never previously required to prove any other vaccine compliance to her employer. At one point, CBS encouraged employees to receive a Hep-A or Hep-B vaccine, but neither of these vaccinations were mandated or enforced.

Overall, Ms. Kraft said her unvaccinated status affected her relationship with colleagues. She did not know whom she could trust. On Thanksgiving Monday, Ms. Kraft received a call from her supervisor, stating she would not be allowed back to work, primarily because she had not consented to any of the imposed measures.

Ms. Kraft filed a grievance with her union and was told she would receive an education package. This never came. She was later informed her complaint would not be going to arbitration. She was not eligible for Employment Insurance. She would not get her job back. When she went into the workplace to pick up her personal belongings, she was ostracized and treated like she was infectious. Since her termination, Ms. Kraft has sought employment on and off but is grateful to have been given this time with her children.

In response to Commissioner questions, Ms. Kraft said she was CBS trained as a phlebotomist. She had signed the CBS code of conduct. CBS had not changed the terms of her employment or job description. The union did not address her complaint. The compliance orders came from CBS Head Office. To the best of Ms. Kraft’s knowledge, CBS was regulated by Health Canada. She said it was unfortunate to see donors dwindling. She confirmed severe reactions were documented in incident reports.

In closing remarks, Ms. Kraft said she was privileged to use her time off to be with her children but others who lost their jobs and homes were not as fortunate. She said it was for those individuals and families that she chose to speak at the NCI hearings.

Canadian Blood Services terminated her position in October 2021.

Analysis

Ms. Kraft’s employer Canadian Blood Services (CBS) is a not-for-profit regulated by Health Canada. CBS is a publicly funded institution. CBS entered into a partnership with the Public Health Agency of Canada (via CTIF) in 2020. The CBS website currently states, “Canadian Blood Services is a COVID-19 vaccinated organization.”

148 Excerpted July 14, 2022, Link: Canadian Blood Services and COVID-19 Information
Moreover, CBS is committed to the principles of diversity, equity, inclusion, and I CARE (Integrity; Collaboration; Adaptability; Respect; Excellence). CBS positions its societal contributions “as the connection between donors and patients, healthcare professionals and medical researchers.” As well, CBS advocates for an environment where all employees can be their authentic selves, with equal opportunities to succeed and contribute.

CBS guarantees a further commitment to basic human rights, including equity, inclusivity, and diversity in the workplace. Together, these statements are particularly critical in understanding the legal obligations and duties of employers in Canada.

Yet, as we understand from the testimony, Ms. Kraft was harassed and made to feel uncomfortable by colleagues, without consequence to the perpetrators. Her workplace did not portray an inclusive environment. Diverse or dissenting viewpoints were not welcomed. Indeed, in this example, CBS did not adhere to their own commitment to provide a work environment wherein all personnel are treated with respect and dignity, permitted to be their authentic selves, with equal opportunities to succeed and contribute.

When Ms. Kraft asked legitimate health-related questions of her immediate supervisors and management team (who are required by occupational-related legislation to be adequately trained in health and safety as well as informed of their respective responsibilities), in writing, she received copy-and-paste email responses that failed to inform. Witness testimony indicates there was no one directive from CBS Senior Management that summarized the risks and benefits of the COVID-19 genetic vaccine(s) or elaborated on the guiding principles of Informed Consent. The Commission is not aware of any actions taken by CBS or the union to bring about a satisfactory resolution or accommodation for Ms. Kraft.

Similarly, Ms. Kraft’s union failed her by not ensuring she received information that could have further educated her personal choices. Perhaps, by acting in the best interests of Ms. Kraft, the union could have protected her from termination. As if this wasn’t enough, EI decision-makers, responsible for ensuring employees/clients who lose their job receive Employment Insurance benefits to tide them over until equivalent employment can be found, also denied her EI benefits—

For misconduct.

From the witness testimony, there is no shortage of questions to pursue. For example, did CBS ever consider the extent to which unvaccinated CBS personnel posed a health risk to donors and colleagues? Did either CBS or the union conduct an exhaustive review of the scientific evidence? What were the findings? Were either CBS or the union aware that all four COVID-19 vaccination choices were still in clinical trials in the fall of 2021?

Were questions raised that, perhaps, CBS policies for vaccination amounted to coercion by the employer or that the vaccination dictate could have been inconsistent with or contrary to provisions of the collective agreement? Or possibly was contrary to the principles of Informed Consent?
Observations

1. Medical freedom, Informed Consent, the right to choose as it pertains to COVID-19 vaccinations:

Informed Consent means persons administering medical treatments or procedures must inform individuals beforehand of the benefits and risks associated with the medical treatment, interventions, or procedures. In this case, the employer CBS mandated that all employees must be vaccinated with one of the four identified Health Canada approved vaccinations and/or undergo regular rapid testing. These demands occurred during a timeframe when all four proposed vaccinations were still in clinical trials. [FDA Clinical Trial website reported vaccinations manufactured by Moderna, AstraZeneca, Pfizer, and Janssen (aka Johnson & Johnson) were still in clinical trials in October 2021.]

The witness clarified the mandates came from CBS Head Office, so in essence, the order came from senior management, who by extension, dictated that employees could not exercise their right to choose when it came to COVID-19 vaccinations. Medical freedom was not an option. Together, these contravene elements of consent which include obtaining informed and explicit consent prior to treatment. It also violates the principle that consent must be voluntary. Consent cannot be considered valid when it is given under conditions of fear or pressure, and this includes threats of disciplinary action or the possibility of losing one’s job.

Section 265(3) of the Criminal Code of Canada defines consent in relation to assault as:

(23) For the purposes of this section, no consent is obtained where the complainant submits or does not resist by reason of (a) the application of force to the complainant or to a person other than the complainant (b) threats or fear of the application of force to the complainant or to a person other than the complainant (c) fraud, or (d) the exercise of authority.

As well, in responding effectively to Ms. Kraft’s questions, CBS should have provided evidence proving that mandatory COVID-19 vaccinations had been fully, independently, and rigorously tested against control groups and released the subsequent outcomes of those tests, including long-term results, a list of potential adverse effects, carcinogenicity, and the impact on fertility, given that Ms. Kraft was still of childbearing age. At the very minimum, the risks and benefits of taking the COVID-19 genetic vaccine should have been communicated to CBS employees and the decision for bodily autonomy left for them to decide.

2. Occupational Health & Safety & The Employee’s Right to Refuse Unsafe Work Conditions:

The right to refuse to perform job duties is embedded in Occupational Health and Safety legislation. Although it has not [yet] been inextricably linked to the more recent employers’ demands that employees be vaccinated—violating an employee’s ability to weigh the risks and benefits in relation to their own health and safety—it doesn’t negate the possibility of a viable argument for revising the legislation going forward.
As it currently stands, employees in a workplace can refuse to perform their duties if they are of the belief or opinion that a certain job task can cause physical harm to themselves or others, and/or it’s a safety risk. This is not new. Indeed, employees weighing health and safety risks while performing their job duties and responsibilities in a workplace have filed refusal to work arguments for decades, and employers have often responded favourably.

By extending this line of thinking, what if the same employee holds a widely held belief that the COVID-19 genetic vaccine poses similar health or safety risks, or as it is in this example, the vaccination options have still not been proven to be safe and effective. Shouldn’t labour protections allow for employees to file a refusal to work for similar concerns?

Notable here, as stated in testimony, Ms. Kraft had a pre-existing medical condition. The vaccines were still experimental and in clinical trials. Adverse side effects of the vaccines were relatively unknown. Research studies and scientific papers were still contradictory with no clear consensus being reached—except by governments and media who are not medical experts.

Ms. Kraft was coerced into unlawfully disclosing a medical treatment to her employer against her will, even though there was still no evidence that a COVID-19 vaccination prevented transmission at the community level. Neither was there any proof that COVID-19 vaccinations protected against the current variants because as the media continuously reported, the virus was constantly mutating in response to vaccine-induced selective immune pressure.

Certainly, it had become evident from the daily and weekly statistics that COVID-19 vaccinations were not reducing hospitalizations or the burden on the healthcare system, raising even more questions given the initial two weeks to flatten the curve mantra. Again, Ms. Kraft was a professional working alongside physicians and nurses within a key component of healthcare (blood services), so her ability to discern health directives would have been heightened. She also cited privacy concerns, referring to the **Personal Health Information Act** specifically.

Still, for Ms. Kraft, it was the myriad of copy-and-paste responses that raised alarms, which is why she sought clarification from her supervisors and management team. Sadly, in her case, she was not given the option to refuse work in the hope of creating a constructive dialogue. Instead, she was terminated.

Given this eventual outcome, it could be suggested the termination was a way of avoiding listening to the viewpoints of a staff member who disagreed with the direction CBS was taking. Occupational laws are designed to protect employees from coercion or, as stated, from employees undergoing undue risk to their own health and safety.

3. Publicly funded institutions, administrative law, neutrality, and discretionary powers:
By virtue of their primary funding sources, publicly funded institutions must legally remain neutral and appear to be at arm’s length from government dictates. Further, decision-makers within the public service must act in accordance with governing legislation. This means agent(s) of government(s) cannot negate their legislated duty in the fulfillment of their responsibilities and second, these duties must be performed without bias and/or reliance on discretionary powers.

What we learned from the testimony is EI denied Ms. Kraft’s application for benefits—for misconduct. We do not know if her life-long medical condition was a consideration in the decision. Neither are we aware if Ms. Kraft’s denial of EI benefits for misconduct was arbitrary, based on earlier precedent-setting decisions made against unvaccinated claimants.

EI legislation points to a process for determining EI status: 1. Show the balance of probabilities [the credibility of the information must be genuine, reasonable, plausible, and based on the facts]; give both the employer and employee an opportunity to provide information as to the reasons for the loss of employment; evaluate the evidence without prejudice; and make the decision based on the weight of evidence. Section ss49(2) of the EI Act states the benefit of the doubt is given to the claimant.

As well, if the EI officer can answer yes to both of the following questions, the claimant is disqualified: Does the information in the file support the finding that the claimant committed actions or omissions as defined by the interpretation given to the word misconduct? Does the information in the file support the finding that the claimant lost their employment because of these actions or omission?

Regarding the establishment of misconduct, it must be shown (a) that the conduct in question constituted a breach of the employer-employee relationship; (b) that the conduct was wilful (c) that there was a causal relationship between the alleged conduct and the dismissal; (d) that the alleged misconduct was not a mere excuse or pretext for the dismissal.

In some cases, an EI decision can involve who initiated the act of severing the employment and the reasons behind this action.

Recommendations
A. Employers mandating vaccinations for all employees in the workplace must provide verifiable data proving vaccine safety and efficacy, outlining the risks and benefits, including any and all adverse effects and provide employees with satisfactory options in the event of vaccine hesitancy and/or refusal.

B. Ensure employers’ duty to adequately train staff in workplace health and safety procedures and to inform supervisors and managers of their respective responsibilities includes establishing the importance and applicability of all related legislation, including the Canada Constitution, 1867, and specific Acts such as the Personal Health Information Act.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

C. **Unions have an obligation** to balance employee protections with arbitrary decisions and compliance orders made by employers. Unions must be required to undertake an exhaustive inquiry of the facts contributing to a grievance particularly when the complaint involves personal choice, bodily autonomy, constitutional protections, and the right to refuse unsafe work conditions.

D. **When employer-employee conflicts arise** from employer mandates requiring vaccination, the union must intervene with the intention of seeking a satisfactory resolution, inclusive of reviewing employer policies and collective bargaining agreements relating to sick leave and disability benefits to determine eligibility [re: extenuating circumstances].

E. **Terminated unvaccinated claimants** who were denied EI benefits based on misconduct must have their files re-assessed to determine whether the alleged breach in the employer-employee relationship came about because of employer forced mandates, coercion, and a person’s right to choose bodily autonomy; a new decision must be rendered.

F. **Ensure affirmative defences** are available for all employees working in publicly funded institutions, including transparent appeal processes.

G. **When non-arm’s length publicly funded agencies** enter into a partnership [such as the partnership between CBS and the Public Health Agency of Canada], there should be legislative assurances that the objectives of the newly intertwined relationships are not contradictory.
7.5.13. Alleged Denial of Medical Treatment Due to Pandemic Measures

Introduction

The allegations brought forward by Ms. Sheila Lewis highlighted a critical and highly complex issue at the intersection of public health, medical ethics, and individual rights, which emerged in the context of the COVID-19 pandemic. This situation underscored the intense debate regarding healthcare access for the unvaccinated, particularly in relation to emergency treatments and life saving procedures such as organ transplants.

From a public health standpoint, the intent behind vaccination policies in healthcare settings is to protect the safety and wellbeing of all patients, particularly those who are immunocompromised, like transplant recipients.

However, the COVID-19 genetic vaccine has been shown to be neither safe nor effective. The COVID-19 genetic vaccines do not significantly reduce the severity of the disease; they do not decrease transmission rates; and they have little or no effect on mortality rates. The effectiveness of the vaccines is also temporary and reported to wane within months of being administered.

In fact, testimony was presented concerning the significant rates of adverse reactions to the vaccines that included death of the patient.

Ms. Lewis testified that she refused to take the COVID-19 genetic vaccine out of a fear of potential adverse reaction to the vaccine. Furthermore, given the fact that the government declared that the pandemic was ended and vaccine mandates had been rescinded, there was no medical need for her to have taken the COVID-19 genetic vaccine, at the time of her testimony.

Discussion

Ms. Sheila Lewis needed an organ transplant to live. She was not alone. Indeed, many other Canadians, essentially strangers to Ms. Lewis, were also on the transplant list. During COVID, the prerequisites to remain registered changed. COVID-19 genetic vaccines had become mandatory. Two vaccinations were required immediately and a third prior to the organ transplant. Ms. Lewis now faced a dilemma. She legitimately questioned the safety and efficacy of these vaccines, noting the clinical trials were still underway.

Ms. Lewis was not the only casualty. Many physician witnesses testified of the abuse and oppression they faced from health and regulatory bodies. Coerced, suspended, disciplined, and/or fired—whatever the eventual outcome—these professional and experienced physicians, as much needed pillars within society, were publicly shamed for standing against the united forces of conformity. At issue was the multi-lateral players, the diatribe of authoritarian messaging, and the political machinations that had slowly become entrenched within the Canadian social fabric.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

From an ever-increasing list of casualties, credentialed physicians, chiropractors, and dentists refused to trivialize or withhold life-sustaining medications from patients. Scientists with PhDs and post-doctoral status investigated the pharmaceutical evidence and found it severely lacking. What motivated each of them to stand against the prevailing narrative? Each valued human dignity, recognizing the critical importance of life and breath. Similarly, they understood the principles of being human. That is, every individual is equal before and under the law and similarly has the right to equal protection and equal benefit of the law—without discrimination.

Many questions emerged. Who is a physician legally bound to protect? Who is the college of physicians and surgeons mandated to serve? Shouldn’t regulatory authorities making serious allegations against their members be forced to apply a higher standard of proof? And of course, one question we all ask: What legal recourses are available when alleged accusations are proven wrong?

All the while, increasing messaging from governments and health authorities alike demanded compliance. Liberties were suspended. Dissenting voices silenced. Freedom of speech, beliefs, thoughts, opinions, and conscience—the very attributes that make us human and alive—were arbitrarily removed. Oppression replaced grace. Injustice replaced human dignity and wellbeing.

Families were divided; businesses shut down. Public shaming and cancel-culture became the norm. In the wake, our human willingness to advance peace, generosity, and social cohesion were displaced. Forced coercion and intimidation began taking hold. In short, our beloved democratic nation of Canada slowly lost its soul. At the same time, political machinations appeared to be on a path towards enslaving the populace, but many people remained unaware of this taking place.

Thankfully, not everyone complied to the ever-changing government dictates. Like Ms. Lewis, many Canadians began to raise a cry for freedom and liberty. Hardworking Canadians, who through their own understanding of self-constitution and personal convictions, were prepared to affirm the worth and dignity of every individual.

Within this context, readers are invited to listen, in order to hear the voices of brave souls willingly standing in the gap for our nation. This Report provides an opportunity to understand the courageous and compelling journey of courageous Canadian citizens who were willing to speak truth to power during a time when open and transparent dialogue was met with negativity and ridicule.

On a human level, the denial of lifesaving treatment due to vaccination status is understandably deeply troubling. Medical care is fundamentally based on principles of beneficence (doing good), non-maleficence (doing no harm), autonomy (respecting the patient’s rights to make decisions about their healthcare) and justice (equal treatment). The case of Ms. Lewis raises profound questions about the importance of retaining a balance of these principles during a public health crisis.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

The “Right to Life” is guaranteed in section 7 of the *Canadian Charter of Rights and Freedoms*. Professor Gail Davidson testified concerning the International Agreements and Treaties which Canada is obliged to uphold. These treaties contain similar requirements (International Human Rights Law) to guarantee the right to Informed Consent to medical treatment as an essential component of other rights, including the right to health, life, and freedom from torture or ill-treatment.

To address such situations, clear and compassionate dialogue between healthcare providers and patients is crucial. Patients should be fully informed of the risks associated with their decision not to get vaccinated, particularly in relation to procedures like transplants where the post-operative immune system is vulnerable.

Healthcare institutions and policy makers must continuously seek to review the logic and necessity of vaccination policies to ensure these policies are ethically sound and to consider exemptions in cases where denying treatment may result in loss of life.

Open and constructive dialogue must be encouraged in society to address the actual current understanding of issues surrounding vaccines, including discussion of existing knowledge and data on safety and efficacy.

Given the critical nature of issues involved and the consequences of service denial, it is absolutely imperative that previously set policies be continually revised and evaluated, especially considering the new body of knowledge available in the present day, rather than relying on earlier pandemic information.

Independent bodies, such as medical ethics committees or legal authorities, should review cases like Ms. Lewis’s to ensure fair treatment. It is vital to remember that every life is valuable, and even in times of crisis, we must strive to uphold the principles of empathy, respect, and justice that underpin the practice of medicine.

**Summary of the Testimony of Shelia Lewis**

Sheila Lewis, resident in Alberta, and a potential transplant recipient, was removed from a patient transplant waiting list for not taking the COVID-19 vaccination. Medically, Ms. Lewis could not survive without the transplant. Despite facing a court-issued gag order limiting her ability to speak freely, Ms. Lewis testified of the intricate process involved in being a transplant candidate.

In testimony, Ms. Lewis reiterated her requirement for a transplant in order to live. While on a waiting list for a transplant, Ms. Lewis was removed from the waiting list because of her refusal to take the COVID-19 vaccinations. She stated that a court order prevented her from naming the organ she required, from naming doctors involved, and from naming the hospitals or hospital locations involved.
As part of the organ transplant process, Ms. Lewis was required to submit her vaccination records. Gathering her vaccination records took about a year. When it came to the discussion of COVID-19 genetic vaccines, Ms. Lewis questioned their safety. She explained that there was no data available to prove the safety of the vaccines, and that “we don’t know anything about them” and was essentially informed that she must “take it or die.”

The Justice Centre for Constitutional Freedoms (JCCF) intervened for Ms. Lewis in the courts. JCCF introduced a constitutional argument to the King’s Bench, including the Bill of Rights. The court agreed with the doctors—that Ms. Lewis should take the COVID-19 vaccinations. The courts also imposed a gag order preventing Ms. Lewis from speaking publicly on specific aspects of her case.

In response to the unanimous decision by the lower court, Ms. Lewis reiterated, “No longer my choice, my body.” She then appealed the decision. At the Court of Appeal, judges did not know whether they could or even should intervene in a medical procedure. Therefore, instead of examining the merits of the case, the Court of Appeal upheld the lower court decision. The gag order remained.

Ms. Lewis had COVID, and therefore had natural immunity. She was informed by a medical professional that her antibodies were higher than most. She applied to the Supreme Court of Canada, wherein, at the time of her NCI testimony, Ms. Lewis was still waiting for a decision. Because the three appellate judges were unanimous in their decision, Ms. Lewis had to make an application to be heard at the Supreme Court of Canada.

“There’s something else wrong here, and it comes from the top,” stated Ms. Lewis, “Doctors and nurses are losing their licences for speaking out.”

She asked the question, “When has there ever been a time in history when this has happened?” She shared that other individuals likewise were taken off the transplant list because of their refusal to take the COVID-19 vaccination. “They deserve to get a transplant too.

“Dear God, there’s a lot of people who need help and I feel for every one of them because I know what I’m going through, and they are going though the same damned thing.”

Ms. Lewis referred to the doctors’ actions in her situation as “evil.” She confirmed that people were dying for no reason, referring to the physicians’ Hippocratic Oath and commitment to do no harm. Weeping, Ms. Lewis concluded by saying she wants to receive the gift of life. “I don’t want to die, God help me.”

Testimony of Mr. John Carpay (Lawyer for Ms. Lewis)
On April 28, 2023, Mr. John Carpay, a lawyer with the Justice Centre for Constitutional Freedoms (JCCF) testified at the NCI hearings. Mr. Carpay alluded to the JCCF representing Alberta resident Sheila Lewis, who was denied a life-saving organ transplant because of her COVID-19 vaccination status.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

JCCF also defends the free speech rights of doctors and nurses threatened with loss of employment. Mr. Carpay reiterated that the doctor-patient relationship, and all other healthcare-patient relationships must be respected. Members monitored by professional regulatory associations, such as the colleges of physicians and surgeons, must be empowered to uphold the tenets of Informed Consent, including the right to make ethical and moral decisions according to their conscience. Why? Because it is the physicians and surgeons who have the specialized medical expertise and knowledge to successfully treat patients, not administrators.

Mr. Carpay recommends that when a public emergency is declared, legislative changes be designed to protect the fundamental human rights and constitutional freedoms of Canadians. These include, in part: health authorities disclosing the evidence or data they are using to justify their recommendations; health authorities identifying the source and documents upon which they rely for imposing mandates; chief medical officers submitting to weekly questioning by an all-party committee in the Legislative Assembly; automatic re-examination of emergency declarations every 30 days; and last but not least, governments producing a cost-benefit analysis when the rights of individuals within a free and democratic society are violated. He also advocates for monthly reports from government(s) showing the public how lockdown measures and vaccine passports negatively affect vulnerable populations.

Mr. Carpay also referred to the World Health Organization definition of health in his testimony, as “a state of complete physical, mental, and social wellbeing, and not merely the absence of disease or infirmity.”

For the record, both of Sheila Lewis’s judicial cases were under a gag order by the courts. The restriction on publication states: “Identification Ban—By Court Order, information that could identify the Respondent Physicians, including their medical specialization, the specific organ at issue, and the location of the transplant program, must not be published, broadcast, or transmitted in any way.”

Discussion of Testimony

Ms. Lewis’s testimony was heartbreaking. Her pleas for help had many in the audience praying intensely for her healing. Bravely, she spoke of numerous individuals like herself who were awaiting an organ transplant. She emphasized the continued need for compassion. In court, the arguments focused on the Charter of Rights and Freedoms. The same sections of the Charter formed the basis of her later appeal. Ms. Lewis’s rationale for taking a stance was that she wanted to live to see her grandchildren grow up.

It is easy to blame government(s). This is not to suggest that the governmental response to COVID-19 was not a significant factor contributing to or leading organ transplant teams (TP) to demand that all organ recipients receive COVID-19 genetic vaccines. Governments were ultimately responsible for establishing measures that dictated how citizens responded to the pandemic. Accordingly, governments must share the blame for any measures they imposed in particular when extreme consequences resulted from those measures.
When Charter arguments are raised in court, Charter infringements require a direct link to government discrimination. For example, violation of the Charter is not a valid argument when the imposing entity is not a non-government, third party entity. In this case, the third party making the decision was the organ transplant team. This team decided policy and set the precondition requirements for organ transplant recipients.

Ms. Lewis only raised the question of safety and efficacy when the COVID-19 vaccinations became mandatory. Like every other person requiring an organ, she was informed that she needed two COVID-19 injections to remain on the transplant list, and a third dose prior to the organ transplant. This was the requirement decided by those responsible for organ transplants. In Alberta, there were no exceptions.

Since Ms. Lewis willingly complied to retaking her childhood vaccinations without hesitation, she could not credibly argue for a religious or medical exemption (if available) when it came to the [experimental] COVID-19 genetic vaccines. Without citing the potential for long-term health risks, the question becomes how does one argue bodily autonomy, the potential for higher risks, and adverse reactions when Ms. Lewis willingly conceded to a second round of childhood vaccines?

Beyond what could appear as picking and choosing which vaccines were safe and which were not, Ms. Lewis after receiving an organ transplant would be required to follow an intensive medication regimen for the remainder of her life. Even though some of these medications may still be undergoing clinical trials, Ms. Lewis did not raise any contentions about safety and efficacy with regard to these medications.

Ultimately, Ms. Lewis was removed from the transplant list, not because of discrimination or a Charter violation directly imposed by governments, but rather, as the Courts ruled, because she refused to abide by the preconditions set in place for organ transplants.

At this juncture legitimate questions emerge. Was the safety of the COVID-19 genetic vaccine on trial? No. Was government the reason Ms. Lewis was dying? No. Were governments directly linked to the violation of Ms. Lewis’s Charter rights? No. Was government interfering with the transplant requirements? It did not appear so. Did the transplant team discriminate against Ms. Lewis specifically, with a requirement for her to submit to more conditions than other potential transplant recipients? No.

Perhaps if the Court was made aware that the Alberta Health Services was systematically removing medically-documented adverse reactions to COVID injections from its provincial reporting system (as other witnesses attested) and/or that the AHS/TP criteria for organ transplants did not include a Charter-required accommodation process (re: religious and medical exemptions), the legal arguments may have garnered a more positive decision.
Nevertheless, as stated, judges are not medical physicians. Nor do they profess to be. Judges are not trained in the investigation of medical and scientific matters. Subsequently, when the scarcity of organ statistics was raised, showing that 40 percent of recipients who were vaccinated with the required COVID-19 vaccinations died while waiting for an organ, this data spoke volumes. While this latter point might raise other equally disturbing medical concerns (re: adverse reactions as a consequence of COVID-19 vaccination), the court was only privy to Charter arguments as a defence, which are only applicable to discriminatory decisions wholly made by governments.

In terms of neutrality, the lack of arm’s length relationship between Health Canada, the Public Health Agency, and Canadian Blood Services (all publicly-funded stakeholders instrumental in establishing organ transfusion criteria) may have offered some relevance. Yet, it would not likely have changed the outcome because the evidence put before the Court had to show that transplant teams were unduly influenced by government(s), or that these entities may have arbitrarily created pressure for doctors to include COVID-19 genetic vaccines on the transplant team list of mandatory injections. As an aside, this too would have required varied legal arguments apart from a constitutional challenge.

Even so, it is this conscious decision by the Courts, choosing not to review the volumes of contradictory scientific and medical evidence, which invites valid criticism. By extension, the judges’ own personal choices to take the COVID-19 vaccinations might have weighed heavily into this component of the ruling. After all, courts are entrusted to review all the evidence set before them, and as such, only then to make informed judgments. However, this did not happen.

Instead, the refusal to examine the volumes of evidence (conflicting or otherwise) could be considered a barrier or prohibition to Ms. Lewis’s quest for justice. It certainly is not the type of legal precedent expected by the public, who at considerable expense to themselves often pursue questions of legality, on principle. Going forward, does this mean every time parties introduce “volumes of contradictory evidence,” the Court can state that such evidence has no bearing? Are Courts by nature, adversarial?

Alternatively viewed, rulings require breadth and depth of wisdom to morally decide a fair outcome when faced with contradictory and conflicting, yet compelling evidence.

Extending this thought further, the increasing silencing of the voices of prominent physicians is causing a ripple effect, resulting in other doctors with similar concerns becoming afraid to speak. What happens when physicians can no longer make informed decisions in the best interests of their patients? What about patients with pre-existing medical conditions who cannot take a vaccine and/or persons who can’t take vaccines because of an earlier adverse reaction—are these persons also excluded from receiving an organ transplant?
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

Can it honestly be said that pressure from governments did not contribute to the inclusion of COVID-19 genetic vaccines on the list of required vaccinations for transplant recipients? And are the judges suggesting that those who are vaccinated would not be fully protected by the COVID-19 genetic vaccine? In considering these points and more, the conflicting evidence before the judges could have provided additional insight into Ms. Lewis’s deeply held beliefs, leaving the question to be asked why only the government narrative prevailed.

An old cliché comes to mind, that without double standards there would be no standards at all. This begs the question: Were no lessons learned from past mistakes like the Stanley Milgram obedience experiments; the spraying of agent orange on an unsuspecting population; or from the use of thalidomide—a Health Canada approved pharmaceutical designed to alleviate morning sickness in pregnant women, which inevitably caused birth defects in infants? To be clear, rejecting volumes of medical and scientific evidence in preference to promoting the prevailing government narrative appears by all accounts to be prejudicial and discriminatory.

While admittedly, the judiciary is bound by the law and by legal arguments before the court, one must query what happens when the law becomes so narrowly construed that the only recourse for judges in the face of gross injustice is to overcompensate by writing a lengthy, detailed decision.

Justice Dickson in the often-cited Oakes test reaffirmed as essential principles in a free and democratic society, the “accommodation of a wide variety of beliefs.” Big M. stated that, “a truly free society is one which can accommodate a wide variety of beliefs, diversity of tastes and pursuits, customs, and codes of conduct.”

Whenever the law itself coerces judges against deciding a morally right outcome, simply because Constitutional arguments before the Court can be nullified by legal precedents, how can this support confidence or faith in public and Canadian institutions, including an independent, objective judiciary?

In other words, the Charter was designed for the unremitting protection of individual rights and liberties, which must, by virtue of a nation under the Supremacy of God and rule of law, include the accommodation for a wide variety of thoughts, beliefs, and opinions. Therefore, an individual's right to hold widely held convictions is non-negotiable. Whether one agrees with the proponent of said beliefs or not, the Charter includes the right of citizens to challenge the status quo, which in this case is the legitimacy, safety, and efficacy of a vaccine that is still undergoing clinical trials.

This accommodation to widely held beliefs is important because the *Charter of Rights and Freedoms* was intended to protect the public from government(s) that elevate the state as the sole arbitrary authority and tutelary power to whom the people are subsequently commanded to be subject, beholden, and obedient. This was the crux of Ms. Lewis’s plea before the Court: that the populace, by virtue of their Constitutional rights and freedoms, are not required by law to blindly obey state decrees mandating conformity and compliance.

In coming to terms with the inauguration of the Charter, which ushered in a new era of law and basic human rights, Justice Gerard V. La Forest wrote:

> Thus far, our basic rights have by and large been protected by our traditions of liberty and the political understandings that have undergirded the supremacy of Parliament and the legislatures. The courts, acting within the confines of these traditions, have long protected the citizens from arbitrary executive and administrative action by insisting that such action be authorized by law, including a series of principles of fair procedure falling under the rubric of natural justice.\(^{150}\)

Even with the Charter, La Forest reiterates that courts have a long-standing obligatory duty in Canada to protect citizens from arbitrary executive and administrative actions by insisting that such action be authorized by law. Accordingly, the Court’s unwillingness to publicly discern contradictory scientific and medical evidence begs another crucial question—who will governments successfully silence next? Will judicial independence be sacrificed on the altar too, at the behest of larger global interests? At the very least, the censoring of scientific and medical literature and peer-reviewed articles should be disconcerting for any person considered intellectual and/or privileged.

Clearly, Canada is at a crossroads between a publicly funded host of bureaucrats, regulatory bodies, agencies, tribunals, committees and a public service collectively exercising and demanding increased control over people’s lives versus the inherent, God-given right of Canadian citizens to make personal choices without coercion when governments have clearly overstepped our fundamental human rights and freedoms. As the evidence proves, the societal changes we are witnessing are not accidental.

The Charter, as part of the Canadian Constitution, is still the supreme law of this nation. Therefore, any law inconsistent with it is, to the extent of that inconsistency, of no force and effect. To this latter point, the judiciary has twice failed to investigate the volumes of evidentiary scientific and medical data before the court. Their reasons for this inaction are immaterial. What matters most is that neither court was willing to rigorously investigate the conflicting scientific and medical evidence before them with the intent of finding a reasonable and rational consensus, and offering hope.

---

Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

With this information, readers are encouraged to listen intently to the many brave and courageous physicians and scientists who, in standing for this country and its citizens, have fought hard against the systematic oppression heightened by governments during the COVID pandemic, whose priorities it appears (under the pretext of global experiment and geopolitical transformation) were to make Canada unrecognizable as a democratic society and to make all Canadians vulnerable.

The testimonies (both individually and collectively) in this Report serve as a stark contrast to the destruction of individual rights and freedoms that Canadians have endured over the last three years. They also serve to remind us all, that as truly free people, we require nothing more in the way of independence. The only way in which the Constitution of a free, intelligent, and independent people can be changed at all is by revolution or the consent of the people.\(^{151}\)

Each physician follows the order of testimony during the NCI hearings. At the end of each witness testimony, there is an instructive takeaway. The overarching question posed by Dr. Daniel Nagase is this: “Where is the justice?”

Recommendations
To prevent situations such as the one faced by Ms. Sheila Lewis from arising in the future, a comprehensive, balanced, and transparent approach needs to be taken. The Commission makes the following recommendations:

A. **Effective Communication and Education:** Both healthcare providers and patients must be committed to effectively communicating with each other. Given the grave consequences of any decisions made, each side must be committed to educating themselves with ALL SIDES of the discussion, which also requires listening to and understanding alternative opinions, and a mandatory review of the latest information available. This must be combined with a detailed and comprehensive list of objective reasons for any decision being made. Following policy is not a defence.

B. **Policy Review and Transparency:** Vaccination policies within healthcare institutions should be regularly reviewed and updated based on evolving scientific evidence. The reasoning behind these policies should be transparent and easily accessible to patients. Policies should be implemented in a non-discriminatory manner and should consider unique circumstances and exceptions.

C. **Ethics Consultations:** Complex decisions involving individual rights and public health should involve consultation with ethics committees. These independent bodies can provide guidance on balancing the competing values at stake, ensuring that any decisions made are fair and respectful of patients’ rights.

\(^{151}\) William Gilbert, House of Assembly, March 26, 1866
D. **Legal Framework:** Legislation should clearly outline the rights and responsibilities of patients and healthcare providers in the context of public health interventions like vaccinations. Clear legal guidelines can help prevent potential abuses and ensure that individuals’ rights are respected and protected.

E. **Patient Advocacy:** Encourage and support the role of patient advocates who can provide a voice for patients, ensuring that they understand their rights and are adequately represented in discussions about their healthcare.

F. **Psychosocial Support:** Provide support services for patients who may be experiencing distress or facing potential discrimination due to their vaccination status.

G. **Community Engagement:** Engage with communities to understand their concerns and attitudes towards vaccination. This can inform more effective communication strategies and foster trust.

H. **“Citizen Overview Committee” or “Public Health Review Board”:** Establish independent review boards to provide an additional level of oversight and accountability for public health decisions, ensuring that these decisions balance public safety with individual rights. Here’s how such a committee might operate:

  - **Composition:** The committee should be comprised of diverse representatives from various backgrounds, including but not limited to healthcare, public policy, law, ethics, social work and patient advocacy. Members should include individuals from different age groups, socioeconomic statuses, ethnicities, and professional backgrounds to ensure a broad range of perspectives. Importantly, the committee should include members of the public who can represent the citizens’ perspective. Each province should be required to set up these boards.

  - **Operation:** The committee should be convened quickly in response to situations that warrant review. This requires a streamlined protocol for initiating reviews and an efficient method of communication among committee members. Given the urgency of public health decisions, the committee should aim to conclude reviews and deliver a decision within 21 days or less, depending on the situation.

  - **Authority:** The committee should have a clearly defined mandate, including the power to request documents, to call witnesses, and to access relevant information. The decisions of the committee should be advisory but carry significant weight in policy decisions.

  - **Transparency:** The committee’s deliberations should be conducted with a high degree of transparency, while respecting necessary privacy laws. Decisions should be publicly accessible, and the reasoning behind each decision should be clearly explained.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

• **Training**: Committee members should receive training to equip them with the necessary skills and knowledge to effectively review public health policy decisions. This could include training in healthcare ethics, public health policy, legal aspects of healthcare, and conflict resolution.

• **Review and Accountability**: The operation of the committee should be periodically reviewed to ensure that it is fulfilling its mandate effectively. This could involve surveys of stakeholders, review of decisions, and an analysis of the impact of the committee’s recommendations.

The justification for a Citizen Overview Committee for public health decisions hinges upon several key democratic principles: representation, accountability, transparency and promotion of the public good.

• **Representation**: Democracy operates on the principle of “government by the people, for the people.” Having decisions that affect public health made by (or under the review of) the very individuals it impacts ensures that a diverse range of perspectives and experiences are considered. This can lead to more balanced and equitable policy outcomes.

• **Accountability**: Public officials, even if unelected, should be accountable to the citizens they serve. A Citizen Overview Committee provides a mechanism for holding these officials accountable for their decisions. This creates a system of checks and balances, ensuring that public health decisions are being made in the best interest of the community.

• **Transparency**: The decision-making process should be transparent to the public. This fosters trust in the system and ensures that policies are implemented fairly and with clear justification. A Citizen Overview Committee, particularly one that makes its findings public, promotes this transparency.

• **Promotion of the Public Good**: Public health decisions should be aimed at promoting the public good. However, the definition of “public good” can vary widely among individuals and communities. A Citizen Overview Committee helps to define the public good in a way that reflects the values and needs of the community.

• **Accessibility and Inclusion**: The committee ensures the voices of marginalized or underrepresented groups are heard in policy-making. This can lead to more inclusive decisions that consider the impacts on all community members.

By basing public health decision-making in democratic principles, a Citizen Overview Committee can ensure that policies are equitable, just, and truly reflective of the community’s needs and values. This approach provides a mechanism to challenge and rectify decisions that may be deemed as unduly harmful or unfair, fostering greater trust and cohesion within the community.
This type of committee could help to ensure that public health policy decisions are subject to rigorous and transparent review, thereby increasing public trust and ensuring a more balanced approach to managing public health crises.

Preventing situations like this from arising in the future requires a commitment and concerted effort from healthcare providers, policymakers, and the community. An approach that respects individual rights while protecting public health is essential. It is a vital and delicate balance, but with empathy, transparency, and open dialogue, it is fully achievable.
8. Recommendations

The intention of this section of the report is to provide a convenient and easy reference or listing of all of the recommendations made in Section 7.

Each of the separate subsections contained in Section 7 are reproduced here, but only the recommendations themselves are included. For a detailed discussion of the rationale for the recommendations and the basis in testimony, we refer the reader to Section 7.

8.1. Civil

8.1.1. Canada’s Justice System

**Recommendations**

Based on the witness testimony and the preceding discussion regarding Canada’s justice system and its actions during the pandemic, here are 10 recommendations for improvements:

A. **Uphold the Rule of Law**: Reiterate and reinforce the importance of the rule of law in Canada’s justice system, emphasizing that all individuals, including the government, are subject to the law.

B. **Review and Rebuild Confidence in Courts**: Conduct a thorough review of the Canadian courts’ handling of pandemic-related cases and their impact on the rule of law. Rebuild public confidence in the justice system by addressing concerns raised during the pandemic.

C. **Separation of Powers**: Reassert the separation of powers among the legislative, judicial, and executive branches, ensuring that each branch functions independently within its prescribed role.

D. **Limit Executive Authority**: Examine and reform the extent of executive authority during emergencies, ensuring proper checks and balances to prevent unelected officials from making far-reaching decisions without accountability or oversight.

E. **Non-Delegation Doctrine**: Study the implementation of a non-delegation doctrine in Canada, similar to some USA states, to ensure that legislative powers are not unduly delegated to unelected administrative bodies.

F. **Accountability of Administrative Bodies**: Enact legislation that requires administrative bodies to demonstrate their expertise and rationale for decisions, particularly when those decisions infringe on individual rights.
G. **Public Health Authorities Oversight**: Establish a clear framework for oversight of public health authorities’ decision-making processes during emergencies to balance public health needs with individual rights and freedoms.

H. **Transparency in College Governance**: Conduct an independent, multidisciplinary inquiry into the governance of professional colleges, especially those governing medical professionals, to ensure transparency, independence, and accountability in their decision-making. The activities of the colleges must adhere to the Charter of Rights and Freedoms.

I. **Freedom of Expression for Healthcare Professionals**: Safeguard healthcare professionals’ freedom of expression, while ensuring that they provide accurate and evidence-based information to the public.

J. **Protecting the Patient-Practitioner Relationship**: Review the ability of regulators to interfere in the patient-practitioner relationship, ensuring that professional judgment remains independent and guided by the best interests of the patient.

These recommendations aim to address the concerns raised in the discussion and promote a more balanced, accountable, and transparent approach to governance and decision-making during public health emergencies in Canada.
8.1.2. The Response of Canadian Courts

Recommendations

Following are recommendations to improve the situations described under each of the separate headings.

A. Protection of Constitutional Rights

• Judicial Review: Reinforce the role of Canadian courts as constitutional guardians by actively engaging in judicial review of government actions, especially those that may infringe upon Canadians’ constitutional rights.

• Robust Assessment: Develop a rigorous and evidence-based assessment process for cases involving rights violations, ensuring that the burden of proof is not disproportionately placed on individuals. Courts should critically evaluate government actions.

B. Access to Justice and Court Shutdowns

• Timely Responses: Implement measures to ensure that court closures, especially during emergencies like the pandemic, do not result in undue delays in access to justice. Develop contingency plans for virtual proceedings, and prioritize cases with immediate consequences.

• Independent Assessment: Courts should independently assess the impact of public health measures on their ability to provide justice. Review the necessity and effectiveness of measures like mask requirements and vaccine mandates in a courtroom setting to ensure fair hearings.

• Public Engagement: Involve legal experts, practitioners, and the public in discussions about maintaining access to justice during crises.

C. Judicial Deference to the Government

• Balanced Review: Encourage a balanced and impartial review process for government policies and actions, rather than automatically deferring to the government’s position. The burden of proof should not unfairly rest on individuals or groups challenging government decisions.

• Comparative Analysis: Consider international precedents, such as the approach taken by courts in the USA, where pandemic measures were subject to rigorous legal scrutiny. Analyze and learn from the experiences of other jurisdictions when addressing similar issues.

• Transparency and Accountability: Promote transparency in court decisions, ensuring they include clear reasoning and explanations for rulings, especially in cases that involve significant rights infringements. This helps build public trust and understanding.

D. Crisis of Confidence in the Judicial System
• **Public Education**: Launch educational initiatives to inform the public about the role of courts in safeguarding constitutional rights, especially during emergencies. Promote an understanding of the court’s duty to question government actions and protect citizens.

• **Judicial Independence**: Emphasize the importance of judicial independence in preserving the rule of law and protecting individual rights. Judges should be selected and trained to have confidence in their role as independent arbiters of justice.

• **Public Engagement**: Create opportunities for the public to engage with the judicial system, such as public consultations or information campaigns. This can help demystify the legal process and foster public participation.

These recommendations aim to strengthen the Canadian judicial system’s ability to protect citizens’ rights, maintain access to justice, and enhance public trust during times of crisis. Implementing these measures would help ensure that courts fulfil their dual role of enforcing laws, while safeguarding constitutional rights effectively.

**E. The Standard of Review in Judicial Review Applications**

The Vavilov standard of review that pays excessive deference to the decisions of unelected administrative officials prevented Canadians from meaningful access to justice and review of their cases. This was particularly egregious where Canadians were fighting for their rights to bodily autonomy, to work, and to participate as free citizens in society.

The Commission recommends that:

• Legislation be enacted to amend the standard of review in cases where the rights of citizens have been affected. This could be implemented in the applicable *Interpretation Acts* and in the applicable *Bills of Rights*.

• The burden of proof should be placed on the administrative body to demonstrate reasonableness in cases where the rights of citizens are affected.

• Statutory protections should be removed for the decisions of health officers to the extent that they cause harm to persons.

**F. Judicial Notice**

• The Commission recommends that legislation be enacted to set strict parameters on the use of judicial notice by courts. Judicial notice should never be allowed in respect of evidence that is being challenged. The normal rules of evidence require a party who asserts a fact to prove that fact. This rule underlies the rule of law and should not be relaxed, even in times of emergency.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

G. Mootness

- **Legislate Parameters**: Consider legislation to modify or limit the doctrine of mootness, especially when cases involve violations of Charter rights. This could include prohibiting mootness in such cases.

- **Timely Hearings**: Address the issue of slow-moving justice by implementing measures to expedite hearings, ensuring that cases are heard before measures or mandates are suspended or removed.

H. Judicial Independence

- **Diverse Selection Committee**: Ensure that the judicial selection committee includes members from various political parties and lay citizens, not just the government, to minimize political bias.

- **Transparent Appointment Process**: Implement a more transparent judicial appointment process, including public debates and hearings, especially for appellate judges, to reduce political bias and enhance fairness.

I. Judicial Appointments Versus Elections

- **Independent Review Panel**: Establish an independent panel or inquiry composed of experts, academics, and experienced practitioners to review the judicial appointment process. Evaluate whether reforms, such as introducing elections at certain levels, are necessary.

- **Balancing Appointments**: Ensure that appointments reflect a balance of judicial independence and government accountability.

J. Federal Appointments of Provincial Judges

- **Provincial Appointment Authority**: Consider devolving the appointment of provincial judges to the provinces, while maintaining appropriate selection processes and advisory committees to safeguard quality and independence.

K. The Judiciary Cannot Act in Tandem with the Government Prosecution Service

- **Enhance Judicial Independence**: Promote and protect the independence of the judiciary, particularly in cases involving government actions, to ensure that citizens have faith in the fairness of the justice system.

- **Resource Allocation**: Allocate resources to support citizens in cases involving violations of Charter rights and freedoms, ensuring they have access to legal representation.

L. Societal Pressure on the Judiciary
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

• **Impartial Selection**: Emphasize the importance of selecting judges who demonstrate the ability to remain impartial, open-minded, and fair during times of societal pressure.

• **Non-Partisan Selection**: Promote a non-partisan selection process aimed at minimizing political influence when appointing judges who possess strong principles to uphold laws as they are written, while also emphasizing fairness.

**M. The Role of Chief Justices**

• **Review Case-Assignment Practices**: Encourage courts to review their case-assignment practices to ensure fairness and balance in the decisions made, particularly regarding Charter rights.

**N. Fear Felt by Legal Practitioners**

• **Support Legal Professionals**: Ensure that legal professionals can perform their roles in the justice system without fear of career repercussions or threats to their safety.

These recommendations aim to uphold the principles of justice, fairness, and the rule of law, while addressing the specific challenges outlined in each section. Implementing them may require legislative changes, policy reforms, and a commitment to preserving judicial independence and protecting the legal profession’s vital role in society.
8.1.3. Labour Law and the Failure of Unions

Recommendations

Based on the testimony concerning labour law and the challenges faced by union members during the pandemic, these recommendations were formulated to address these issues:

A. **Legislation to Protect Union Members:** The Commission recommends that legislation be adopted to include ensuring the protection of union members where the member asserts

- that Charter rights have been violated as a result of actions of the employer or the union, and
- a grievance against his or her employer that the union fails to, or refuses to, defend.

B. **Review and Strengthen Labour Laws:** The government should review labour laws to ensure that they provide adequate protection to both unionized and non-unionized employees during health emergencies like the pandemic. This should include mechanisms for addressing workplace issues related to mandates and safety concerns.

C. **Enhance Union Accountability:** Labour laws should be amended to hold unions more accountable for representing their members effectively. This could involve regular assessments of a union’s performance in advocating for its members’ rights during crises. Unions should be required to demonstrate that they are acting in the best interests of all of their members.

D. **Ensure Union Transparency:** Unions should be transparent about their decision-making processes and actions during crises. Members have a right to know how their union is advocating for them. Transparency can help build trust between members and their unions.

E. **Access to Legal Recourse:** Labour laws should be revised to allow union members to have access to legal recourse in cases where their union fails to adequately represent their interests. This could include the ability to bring direct actions against employers under certain circumstances, such as when the union refuses to take up their case.

F. **Legal Aid for Union Members:** Governments should consider providing legal aid or support to union members who need to take legal action against their union or employer. This would help level the playing field for employees who find themselves in such situations.

G. **Mediation and Dispute Resolution:** Establish mediation or dispute resolution mechanisms specifically tailored to labour disputes arising from health emergencies. This can provide a more efficient and cost-effective way to address employer-employee issues than lengthy court battles. Reasons for decisions must be made public.

H. **Educate Union Members:** Unions should play a proactive role in educating their members about their rights and the grievance process. Well-informed members are better equipped to hold their unions accountable and make informed decisions during crises.
I. **Encourage Collaboration**: Governments, unions, and employers should work together to develop clear guidelines and protocols for dealing with workplace issues during health emergencies. Collaboration can help prevent conflicts and ensure the best interests of workers are protected.

J. **Whistleblower Protections**: Strengthen protections for whistleblowers within unions and workplaces. This can encourage employees to come forward with concerns without fear of retaliation.

K. **Public Inquiry**: Consider launching a public inquiry into the specific challenges faced by unionized employees during the pandemic. This can help identify systemic issues and inform policy changes.

These recommendations aim to address the shortcomings in labour laws and union representation highlighted during the pandemic. They seek to strike a balance between protecting individual employee rights and maintaining the integrity of collective bargaining agreements.

L. **Educate Union Members**: Unions should play a proactive role in educating their members about their rights and the grievance process. Well-informed members are better equipped to hold their unions accountable and to make informed decisions during crises.

M. **Encourage Collaboration**: Governments, unions, and employers should work together to develop clear guidelines and protocols for dealing with workplace issues during health emergencies. Collaboration can help prevent conflicts and ensure the best interests of workers are respected and protected.

N. **Whistleblower Protections**: Strengthen protections for whistleblowers within unions and workplaces in order to help encourage employees to come forward with concerns without fear of retaliation.

O. **Public Inquiry**: Consider launching a public inquiry into the specific challenges faced by unionized employees during the COVID-19 pandemic. This Inquiry could help to identify systemic issues and to inform policy changes.

These recommendations aim to address the shortcomings in labour laws and union representation highlighted during the pandemic. The recommendations seek to strike a balance between protecting individual employee rights and maintaining the integrity of collective bargaining agreements.
8.1.4. The Constitution

Recommendations

The Commission recommends that legislation be enacted prohibiting employers from imposing vaccine mandates on employees.

A. **Canada should establish** an independent review of its judicial appointment process.

B. **The federal and provincial courts** should conduct a national inquiry into their response to pandemic measures, including a review of:
   
   a) What role did the court play in protecting the rights of individuals?
   
   b) What role should the court play when a government imposes vast rights-violating measures?
   
   c) Should the government have the ability to impose pandemic measures on courts and the judiciary?
   
   d) What level of independence do the courts have over their own process in implementing publicly recommended or ordered measures?
   
   e) Should guidelines or best practices be adopted for case assignment, particularly in cases that involve alleged violations of Charter rights?

C. **Judges in provincial courts** should be appointed by provincial governments and not the federal government. This recommendation is subject to review as part of the overall review of the judicial appointment process.

D. **The judicial selection** process should involve a review by a panel that involves a wide array of citizens and legal experts with different political views and backgrounds. Recommendations for appointments should be made public.

E. **Canada should establish a fund** to pay for legal services for Canadian citizens who bring cases against the government for a violation of Charter rights or who are defending prosecutions that violate Charter rights. Further study could be undertaken to determine the structure and principles governing the fund. Some fundamental principles should include:
   
   a) The fund is governed/overseen by a board which has equal representation from constitutional scholars, lawyers, government representatives, academics, and citizens.

F. **Canada and the provinces** should legislate parameters for mootness, including a prohibition on mootness when a case involves a violation of the Charter rights of an individual.

G. **An independent inquiry should** be conducted into the response of the medical colleges in each province, including a review of
a) What role did the college play in protecting the rights of its members?

b) What role should the college play when a government makes recommendations for medical practice?

c) Should there be specific limits placed on the powers of the colleges?

d) What regulations can be put in place to assure that the colleges adhere to the Canadian Charter of Rights and Freedoms?
8.1.5. Undermining Democratic Institutions

Recommendations

A. **Informed Consent**: Political parties should enshrine the principle of Informed Consent into party rules and constitutions, guaranteeing each member the freedom to make their own decision and to be free from coercion or mandates to receive a medical treatment.

B. **Protection of Elected Representatives’ Independence**: The parties should adopt regulations to protect the independence of elected representatives so that elected officials are able to express their views and concerns freely without fear of retribution from their own political parties.

C. **Whistleblower Protections**: Clear whistleblower protections for politicians and party members who raise concerns about government actions or policies should be established, with protections extending to all levels of government and including all elected officials at all levels of government.

D. **Transparency and Accountability**: Decisions by political parties, municipalities, and school boards should be transparent. Parties should be required to provide clear reasons for any actions taken against their members. This includes publicizing party decisions and disciplinary actions.

E. **Strengthen Party Democracy**: Encourage internal party democracy by allowing members to openly debate and express dissenting opinions on significant issues, especially during crises like a pandemic.

F. **Reform Legislative Procedures**: Review and reform legislative procedures, particularly during emergencies, to ensure that there is sufficient time for members to review and debate bills. Emergency legislation should not bypass the regular legislative process.

G. **Public Consultation and Accountability**: Ensure that significant decisions related to public health measures and emergencies are subject to public consultation and accountability. Decisions should be based on a transparent and evidence-based approach.

H. **Protection of Parliamentary Sessions**: Protect the integrity of parliamentary sessions by maintaining regular working hours and ensuring that important votes are conducted when a significant number of members are present.

I. **Review Emergency Powers**: Review and assess the powers granted to governments during emergencies, such as those under the *Emergencies Act*, to ensure that they are not overly broad and they respect democratic principles. Consider legal mechanisms for parliamentary oversight.
J. **Education on Legislative Processes**: Educate elected representatives and the public about legislative processes and the implications of emergency measures. This includes training for politicians on their roles and responsibilities during crises.

K. **Independent Oversight**: Consider the establishment of an independent oversight body or commission to monitor and evaluate government actions during emergencies, ensuring that democratic principles are upheld.

L. **Protection of Opposition Rights**: Strengthen the rights and protections of opposition parties to allow them to effectively scrutinize government actions, especially during emergencies. This includes timely access to information and the ability to hold the government accountable.

M. **Public Inquiry**: Consider launching a public inquiry to investigate the undermining of democratic institutions during the pandemic. The findings of such an inquiry can inform necessary reforms.

These recommendations aim to safeguard democratic institutions, protect the independence of elected representatives, and ensure that decision-making during emergencies is transparent, accountable, and based on democratic principles.
8.1.6. International Law

Recommendations

Based on the information provided in the testimony and other considerations, here are some recommendations on what Canada could do concerning international laws and treaties, especially in the context of the COVID-19 pandemic and potential future health crises:

A. Pandemic Convention: The NCI recommends that Canada register immediate reservation against the Pandemic Convention and the amendments to the International Health Regulations once they are put forth by the WHO to allow time for proper consideration of the initiatives and their potential impact on Canada. At the same time, Canada should conduct a public inquiry and consultation into the benefits and risks of both its current obligations under the WHO, and the proposed Pandemic Convention and proposed amendments to the International Health Regulations.

B. Review and Comply with International Human Rights Law: Canada should thoroughly review its COVID-19 response measures in light of international human rights law. It should ensure that measures taken during the pandemic—such as vaccine measures, lockdowns, and restrictions on movement—consider international human rights standards. If any violations are identified, corrective actions should be taken.

C. Strengthen Informed Consent: Canada should reinforce the importance of Informed Consent, especially in the context of medical treatments like vaccines. It should ensure that individuals have access to comprehensive information about medical treatments, including potential risks and benefits, and have the right to refuse treatment without coercion.

D. Enhance Vaccine Injury Compensation: Canada should assess and improve its vaccine injury compensation program to make it more accessible to those who have suffered harm due to vaccinations. This should include a transparent, streamlined claims process, and increased transparency.

E. Conduct a Comprehensive Inquiry: Canada should initiate a comprehensive and independent public inquiry into its pandemic response measures. This inquiry should have the authority to compel testimony and access relevant information. It should identify responsible parties for any human rights violations and recommend appropriate remedies.

F. Monitor WHO Developments Closely: Canada should closely monitor and participate in negotiations related to the World Health Organization’s Pandemic Convention and amendments to the International Health Regulations. It should advocate for transparency, respect for national sovereignty, and the protection of individual rights in these international agreements.

G. **Protect National Sovereignty:** Canada should maintain its sovereignty over public health decisions. While international coordination can be valuable, it should not infringe on Canada’s ability to tailor its responses to its unique circumstances. Any international agreements should be voluntary and non-binding.

H. **Balance Health and Human Rights:** Canada should strike a balance between public health measures and human rights. While protecting public health is crucial, measures taken during health emergencies should be lawful, legitimate, necessary, proportional, and temporary. Canada should avoid disproportionately infringing on human rights.

I. **Promote Transparency and Debate:** Canada should ensure that information relevant to pandemic measures is disclosed to the public, allowing for informed debate and discussion. Public health measures should be debated openly in democratic forums, allowing for diverse perspectives to be considered.

J. **Provide Redress for Victims:** Canada should ensure that victims of human rights violations, including those resulting from pandemic measures, have access to effective remedies. This includes compensation for losses and harm suffered due to these violations.

K. **Engage with Civil Society:** Canada should engage with civil liberties organizations, human rights advocates, medical professionals, and other relevant stakeholders, including the public, to ensure that responses to health crises are well-informed and respectful of human rights.

These recommendations are aimed at ensuring that Canada’s responses to health emergencies uphold international human rights standards, protect individual freedoms, and safeguard national sovereignty, while promoting public health. It’s important for Canada to strike a balance between these critical considerations in its domestic and international actions.
8.1.7. Coercion Does Not Equal Consent

Recommendations
The report highlights various instances of coercion and its impact on individuals’ decisions regarding COVID-19 vaccination. To address these issues and mitigate the failures of the system, here are eight recommendations:

A. Protect Individual Rights

- **Legislation Against Coercion**: Introduce legislation that explicitly prohibits coercive tactics, whether by employers, educational institutions, or any other entity, in relation to medical treatments, such as vaccinations. Ensure that individuals have the freedom to make informed choices without undue pressure.

B. Transparency and Accountability

- **Require Organizations to Provide Legal Basis of Mandates Imposed**: Conduct a comprehensive review of the legal opinions obtained by employers who implemented vaccine mandates. Ensure these opinions align with fundamental principles of consent and individual rights. Publish these legal opinions for public scrutiny.

C. Access to Education and Work

- **Online Learning Options**: Ensure that individuals who choose not to get vaccinated have access to online education, especially in institutes of higher education, to avoid coercion through denial of educational opportunities.

- **Job Protection**: Enact legislation to protect employment insurance benefits for individuals who choose not to get vaccinated. Losing employment due to vaccine refusal should not lead to financial hardship.

D. Informed Decision-Making

- **Factual Communication**: Government and public health authorities should communicate drug information transparently and factually. Encourage vaccination through education, emphasizing the benefits of vaccination rather than resorting to coercion.

- **Accurate Data Reporting**: Ensure accurate reporting of COVID-19 data, including vaccine effectiveness, and avoid any manipulation or misrepresentation that may lead to coercion.

E. Address Vulnerabilities

- **Support Vulnerable Groups**: Recognize and support vulnerable populations, such as those with addiction issues, with strategies that do not resort to coercion. Ensure they have access to essential services and support networks.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

F. Independent Oversight

• **Ombudsman or Commission**: Establish an independent body, like an ombudsman or commission, to investigate cases of coercion and violations of individual rights related to vaccination. Provide a channel for individuals to report coercion and seek redress.

G. Avoid Political Exploitation

• **Ethical Political Discourse**: Encourage ethical political discourse around public health measures, including vaccinations. Ensure that political campaigns do not exploit vaccination issues or use coercion for political gain.

H. Rebuild Trust

• **Public Apology**: Governments should issue public apologies to individuals who felt coerced into vaccination and acknowledge the harms caused by these coercive measures. Rebuilding trust should be a priority.

These recommendations aim to strike a balance between promoting vaccination for public health and respecting individual rights and choices. They seek to prevent coercion, protect individual freedoms, and rebuild trust between the government and its citizens, especially in the context of medical treatments like vaccines.
8.1.8. Emergency Planning & Plan Execution

Recommendations

Based on the totality of the witness testimony, the following recommendations are presented:

A. **Emergency measures organizations** (EMOs) must be in charge of planning, implementation, and recovery from any and all “emergencies.”

B. **Public health officials** should never be put in charge of emergency response. They should be a critical component of the planning but should never be charged with running a response.

C. **Emergency Management Act** powers must supersede the powers of the various public health officers. The public health officers must come under the authority of the emergency management agencies.

D. **Elected officials** must remain in charge of all emergency measures.

E. **Follow existing emergency plans.**

F. **Make sure all emergency plans** are publicized and the contents well known by stakeholders in all affected areas.

G. **Require mandatory training** of emergency response personnel.

H. **Follow all emergency measures** legislation in each jurisdiction.

I. **Emergency planning** must be driven from the bottom up.

J. **Federal government should not** be leading emergency response. They should be limited to supporting the requirements of the local authorities.

K. **Media and government cannot be allowed to collude** to present a pre-approved information campaign.

L. **The consultation process** should involve the public, and the comprehensive plan to tackle the pandemic emergency should be regularly, consistently, and promptly communicated to the public.

M. **In any future emergencies**, the government should focus on mitigating public fear and anxiety rather than resorting to fear and terror as a means to secure compliance.

N. **Require mandatory cost-benefit analysis** of any and all emergency measures considered and/or imposed.

O. **Require transparency in decision-making.**

P. **Support open public discourse**, without censorship.
Q. **Require a mandatory recovery plan** to fix the collateral damage done by the pandemic measures.

R. **Require a mitigation plan** for all societal damage done by the pandemic measures.

S. **Establish regulations to ensure** that the elected officials are never sidelined or abrogate their powers to unelected bureaucrats.

T. **Commission an independent study** which is required to include members of the emergency measure organizations from across Canada.

U. **Rebuild emergency response** organizations across Canada.
8.1.9. COVID-19 Pandemic Mandates in the Workplace

Recommendations
We recommend the following:

A. **Immediate development of a judicial panel**, overseen by citizens, with the responsibility to investigate the human rights violations that were committed by both governments and private corporations during the pandemic.

B. **Develop and implement** a constitutional and international law education course for all judiciary positions across Canada. The intent is to educate judges and Crown attorneys as to their responsibilities under the constitution and international treaties to which Canada is a signatory nation.

C. **Carry out immediate judicial reviews** of all pandemic-related court cases that were denied on the basis of mootness or judicial notice.
8.1.10. Policing During COVID-19 Pandemic: Balancing Authority and Citizens’ Rights

Recommendations

A. **Independent Judicial Investigations**: Conduct independent and transparent judicial investigations into allegations of illegal activities by law enforcement officers during the pandemic, ensuring accountability and adherence to the rule of law. This investigation must have the power to enforce subpoenas to obtain witness testimony and critical documents.

B. **Review and Revise Policing Protocols**: Collaborate with law enforcement agencies to review and revise their protocols and guidelines for enforcing government mandates, with a focus on respecting individual rights and freedoms while safeguarding public health.

C. **Enhance Training and Education**: Provide comprehensive training on handling public health crises to law enforcement officers, emphasizing respect for human rights, de-escalation techniques, and community engagement.

D. **Public Awareness Campaigns**: Launch public awareness campaigns to educate citizens about their rights and responsibilities during health emergencies, promoting dialogue and cooperation between the police and the community.

E. **Community Policing Initiatives**: Promote community policing initiatives that foster positive relationships between law enforcement agencies and the communities they serve, enhancing trust and cooperation.

F. **Clear Accountability Mechanisms**: Establish clear mechanisms for holding law enforcement agencies accountable for their actions during the pandemic, ensuring transparency and fairness in the disciplinary process.

G. **Civilian Oversight**: Strengthen civilian oversight bodies to independently monitor police conduct during public health crises, ensuring adherence to legal and ethical standards.

H. **Regular Reporting and Transparency**: Mandate law enforcement agencies to regularly report on their activities during health emergencies, providing transparency and accountability to the public, while respecting privacy and security concerns.

By implementing these recommendations, authorities can strike a balance between maintaining public safety during health crises and upholding the fundamental rights and freedoms of citizens, ensuring a more just and equitable response to future pandemics.
8.2. Social Impacts

8.2.1. Neglect and Isolation of Seniors in Canada Amidst COVID-19 Measures

Recommendations

A. **To alleviate the neglect and isolation** faced by seniors, it is crucial for the federal, provincial and territorial governments, communities, and individuals to take proactive steps. First and foremost, healthcare systems should prioritize healthcare needs of seniors, ensuring that seniors have access to essential medical care and support services.

B. **Moreover, efforts should be made to enhance** the social connections of seniors. This can include facilitating safe visitation policies in long-term-care homes, promoting intergenerational programs, and encouraging community organizations to provide support and companionship to isolated seniors. Volunteering initiatives, teleconferencing platforms, and community outreach programs can help bridge the gap between seniors and their support networks.

C. **Financial assistance programs should be expanded** to specifically address the needs of seniors who have been adversely affected by the pandemic mandates. Providing targeted financial support, job training, and re-employment opportunities can help seniors regain their financial stability and alleviate some of the stress they face.

D. **Bridging the digital divide among seniors** should be a priority. Initiatives aimed at enhancing digital literacy and providing seniors with the necessary tools and resources to access online services can empower them to connect with their loved ones, access information, and engage in virtual social activities.

E. **It is imperative that a judicial investigation** be carried out immediately to determine if any criminal wrongdoing was perpetrated on our senior populations during the pandemic. Witness statements from staff, seniors, and family must be immediately obtained and archived, to be used as evidence in any future prosecutions.

F. **An investigation should be conducted** into how the various regulatory agencies abandoned their roles of protectors of seniors and never appeared to visit facilities to check on the operation and level of care being given out.

G. **Those caregivers who simply followed** the orders given to them to isolate and dehumanize our seniors in their care must be re-educated or removed from the system and not allowed to continue to provide “care” to seniors.

H. **Like other professions**, caregivers and administrators working with seniors should be mandated to participate in annual professional development and training programs.
8.2.2. The Effects of Sustained Propaganda and Terror

Recommendations

Preventing governments from using propaganda and terror against their people requires a multifaceted approach that involves promoting accountability, safeguarding human rights, and fostering democratic institutions. Here are some key strategies:

A. **Establish and uphold a robust human rights framework** that protects the fundamental rights and freedoms of individuals. This includes enshrining indelible human rights in constitutions, implementing international human rights conventions, and ensuring an independent judiciary to safeguard citizens’ rights.

B. **Foster a strong rule of law** by ensuring that government officials and security forces are held accountable for their actions. This includes establishing independent oversight bodies, conducting transparent investigations into allegations of human rights abuses, and prosecuting those responsible for violations.

C. **Promote freedom of expression** and an independent media that can serve as a watchdog to hold governments accountable. Protect journalists, bloggers, and activists from harassment, censorship, financial repercussions, and violence, and ensure their ability to report on government actions without fear of reprisal.

D. **Support and empower civil society organizations**, including human rights groups, advocacy organizations, and community-based initiatives. These organizations play a crucial role in monitoring government actions, advocating for human rights, and providing support to victims of abuse.

E. **Promote and strengthen democratic governance** by ensuring free and fair elections, transparent electoral processes, and respect for the will of the people. This includes promoting political participation, guaranteeing the independence of electoral bodies, and providing opportunities for citizens to engage in decision-making processes.

F. **Leverage international cooperation** and pressure to address human rights violations. Encourage diplomatic efforts, international organizations, and regional mechanisms to hold governments accountable for their actions, and impose targeted sanctions or other measures against those responsible for terrorizing their own populations.

G. **Support international human rights mechanisms**, and provide them with the necessary resources and authority to investigate and address human rights violations perpetrated by governments. Collaborate with these mechanisms to bring attention to abuses and advocate for meaningful action.
H. **Promote human rights education** and awareness among citizens, government officials, and security forces. Encourage a culture of respect for human rights, tolerance, and non-violence through educational programs, public campaigns, and training initiatives.

Preventing governments from using terror against their people requires ongoing commitment and vigilance. It is a collective effort that involves the active participation of citizens, civil society, international actors, and the government itself. By upholding human rights, promoting accountability, and fostering democratic values, societies can strive towards preventing and addressing government-led terror.
8.2.3. Social Effects of Mandates on Canadian Institutions

Recommendations

The process of restoring trust in Canadian institutions is a very difficult and complex one. What was destroyed in a very short period of time will take a generation to restore, and only if these institutions make a concerted effort to restore that trust through their day-to-day actions.

Momentary publicity campaigns and propaganda blitzes will not serve either the institutions or the people of Canada's best interests.

If these concerns are not addressed in a forthright manner, the very existence of Canada as a free and democratic nation is at risk.

The commission recommend the following:

A. **It is not an option** to take a “business as usual” posture and simply carry on as if nothing happened. Institutions must recognize and publicly admit their culpability in what was perpetrated on Canadians and, if appropriate, must face criminal and civil penalties for their actions.

B. **Transparency and Accountability**: Information related to the institutions’ actions during the COVID-19 pandemic must be made publicly available, creating a culture of transparency and accountability within public institutions.

C. **Ensure that decision-making processes** are open and accessible to the public, and that the actions and performance of public officials are subject to scrutiny.

D. **Establish mechanisms for oversight**, such as independent audits or ombudsman offices, to hold institutions accountable for their actions.

E. **Ethical Conduct**: Promote and enforce high ethical standards within public institutions. Implement robust codes of conduct that govern the behaviour and decisions of public officials and employees. Provide ethics training to ensure that individuals understand their responsibilities and the expectations placed upon them.

F. **Effective Governance**: Strengthen governance structures and mechanisms to ensure efficient and effective functioning of public institutions.

G. **Enhance the professionalism** and expertise of public servants through training and development programs. Foster a merit-based culture that rewards competence and performance.
H. **Public Engagement**: Actively engage with the public and involve stakeholders in decision-making processes. Seek public input through consultations, town hall meetings, surveys, and other participatory mechanisms. Demonstrate that public institutions are responsive to the needs and concerns of the people they serve.

I. **Communication and Information Dissemination**: Establish clear and consistent communication channels to keep the public informed about the work and activities of public institutions. Provide timely and accurate information, particularly in times of crisis or controversy. Use plain language and accessible formats to ensure that information is easily understandable by all segments of society.

J. **Collaboration and Partnerships**: Foster collaboration and partnerships with civil society organizations, academia, and other stakeholders. Engage in meaningful dialogue and involve external expertise in policy development and implementation. Collaborative approaches can help build trust and ensure that institutions benefit from diverse perspectives.

K. **Learn from Mistakes**: Acknowledge and learn from past mistakes or failures. Publicly address any instances of wrongdoing or misconduct, and take corrective actions. Demonstrate a commitment to learning, improvement, and the prevention of similar issues in the future.

L. **Long-Term Vision and Consistency**: Develop and communicate a clear long-term vision for the institution’s role and purpose. Demonstrate consistency in actions and decision-making, avoiding unnecessary reversals or abrupt changes. Consistency helps build trust by showing that institutions are reliable, accountable, and predictable.

M. **Independent Oversight and Checks and Balances**: Strengthen the role of independent oversight bodies, such as auditors general, ombudsman offices, or anti-corruption commissions. These bodies can provide an additional layer of accountability and help prevent abuses of power or corruption.

Rebuilding trust in public institutions is a long-term endeavour that requires sustained commitment and effort. By implementing these strategies, institutions can work towards restoring faith in their integrity, competence, and ability to serve the public interest.
8.2.4. The Impact of COVID-19 Measures on the Military

Recommendations

The fact that a citizen has put on a uniform and vowed to serve and protect Canada should not strip them of all rights and leave them with no legal avenues. The Commission makes the following recommendations:

A. **Grievances by service members** should be outside of their chain of command and to an independent reviewer, such as the Office of Inspector General.

B. **Whistleblower legislation should be strengthened** to allow soldiers to report on abuses within their chain of command without fear of discipline or retaliation.

C. **Comprehensive healthcare should be provided** to all injured service members, for as long as necessary.

D. **An apology** should be issued for implementing the vaccine mandate.

E. **Where a medical product is provided** to members of the Armed Forces, mandatory monitoring and reporting of injuries and sickness should be performed.
Recommendations

A. Avoid Prolonged School Closures: Recognize that extended school closures should not be imposed in the future, as they have profound and far-reaching negative impacts on the socialization and education of children.

B. Prioritize In-Person Learning: Ensure that in-person learning remains the primary mode of education, even during public health crises. Remote learning should only be used as a last resort and for a limited duration, and in conjunction with parental consultation.

C. Data-Informed Decision-Making: Base any decisions related to school closures on comprehensive and up-to-date data, considering the specific needs and circumstances of each region or community.

D. Support Vulnerable Populations: Develop targeted support systems for vulnerable students, including those with disabilities and students from low-income backgrounds. Recognize that these populations may be at higher risk than the general student population and provide specific measures to protect them. Do not impose these measures on the entire student population.

E. Enhance Mental Health Services: Invest in mental health support services within schools to help students cope with the emotional toll of the pandemic and the challenges of social isolation.

F. Prioritize Social and Emotional Learning: Incorporate social and emotional learning into the curriculum to help students build resilience and emotional intelligence, especially in the aftermath of the COVID-19 pandemic.

G. Maintain Transparent Communication: Keep parents, students, and the community informed with clear and transparent communication regarding the reasons behind any decisions related to school closures or restrictions.

H. Plan for Crisis Scenarios: Develop contingency plans that prioritize education and socialization, while maintaining health and safety during future crises.

I. Learn from Past Mistakes: Conduct a comprehensive review of the government’s response to the COVID-19 pandemic in education, and use the lessons learned to shape future policies that prioritize the wellbeing and education of our children.

By implementing these recommendations, we can work towards a future where our education system remains resilient in the face of emergencies, ensuring that our children’s socialization and development are protected and nurtured.
8.2.6. The Restructuring of Traditional Educational Institutions Due to COVID-19 Measures

Recommendations

A. **As publicly funded institutions**, both universities and colleges must adhere to the law of neutrality before demanding compliance for policies that potentially may not be legally enforceable.

B. **In all publicly funded institutions**, whereby the mission includes scholarly inquiry and academic freedom as institutional tenets, there must be room for dissenting voices, debate, dialogue, and, most particularly, policy revisions when the evidence points to a change in the data and statistics that led to restrictive policies initially.

C. **There must be a cost-benefit analysis** of any policy that leads to school closures, and discussions must include the public and education stakeholders.

D. **In the interest of academic freedom and integrity**, post-secondary institutions and faculty should be able to ask pointed questions free from any fear of repercussions.

E. **Investigate scientific findings** that contradict the narrative, and provide internal grant funding to ensure the evidence relied upon by governments and health authorities is accurate.

F. **Post-secondary institutions** should not be allowed to impose additional mandates or extend mandates beyond that imposed by the government regulators. During the COVID-19 pandemic, once the initial two-week to flatten the curve period had concluded, post-secondary institutions should have lifted all policy restrictions. Similarly, when the emergency orders were lifted, post-secondary COVID policies should also have been terminated.

G. **Offer an array of learning platforms** and alternative arrangements for academic study, including in-person classes, and online, distance, and hybrid options.

H. **Ensure all students have an opportunity** to reach their potential without discrimination or bias due to vaccination status.

I. **Any faculty or staff member who suffered a job loss**, was terminated, or was placed on unpaid leave and subsequently barred from campus should be immediately restored to good standing. Additionally, any negative or potentially stigmatizing comments regarding the employee’s COVID stance should be removed forthwith from that employee’s files. Pensions should be fully restored to pre-COVID status.

J. **Post-secondary institutions should focus** on student achievement and not the removal of students from programs for not being compliant with newly established vaccination policies. No student should lose academic standing or lose successfully completed academic credits for non-compliance to a policy.
K. **Students in residence should have opportunities** to socialize with other residents under the auspices of cohorts. Students should never be restricted to their rooms.

L. **Reimburse students who paid for residence** in good faith but because of a change in COVID policies combined with an individual’s unvaccinated status, were forced to vacate the premises.

M. **Accommodation in accordance with the Charter of Rights and Freedoms** must be made. It is a constitutionally protected right for all persons. Therefore, faculty, staff, and students requesting accommodation should not only have their concerns heard but taken seriously when blanket COVID policies are initiated. This includes accepting medical, religious, and personal exemptions. It also means consideration for other circumstances, including personal choice, convictions, conscience, deeply held beliefs, or health risks (for example, previous adverse reaction to a vaccine).

N. **Health policies should provide allowances** for bodily autonomy and personal choices. Employees and contractors—including faculty members, staff, and students—should not be required to disclose their medical information to obtain an allowance.

O. **Policies that lead to the segregation** of a specific group of students is discriminatory. Therefore, any policy promoting segregation must be immediately removed.

P. **Post-secondary institutions** should have to provide justification in writing for responding to government mandates with inflexible approaches.

Q. **Any policy must be subject to revision** when it becomes apparent that restrictions are not necessary. For example, there should be a mandatory review process every 30 days.

R. **Meet with stakeholder groups—including faculty**, staff, and students—who made different choices regarding vaccines and COVID policies.

S. **Eliminate all policies and procedures** that directly violate human rights legislation, including denial of a service or services.

T. **Employment loss and/or disciplinary action** (including unpaid leave) must follow the same human rights procedures for all faculty and staff. Vaccination status should not be a sufficient excuse or justification for applying union procedures differently.

U. **A union’s mission is to protect and defend the rights** of staff and faculty across campus. The union does not have the right to arbitrarily deny unvaccinated staff and faculty the right to file a grievance and to have the grievance heard.

V. **Employees with long-standing service** should not suffer a loss of pension and other benefits because of personal health choices.
W. **Third-bucket youth** who were not educated during the pandemic need to be found and their circumstances addressed so they can be educated and subsequently prepared for the future.

X. **Schools should not be closed** for periods of time exceeding one week in duration.

Y. **Virtual schooling is not advantageous** to youth experiencing learning disabilities, having language barriers, or living in an unsafe or abusive situation. These additional barriers to learning need to be taken into consideration.

Z. **Young, healthy people should not be shut out** of schools for as long as they were. Studies as early as May 2020 showed that suicides, eating disorders, opioid deaths, and substance abuse were skyrocketing among young people. Students should have been allowed to go back to in-person learning with no more interruptions.

AA. **Special needs children and adults** require additional guidance and direction. Therefore, one-size-fits-all blanket policies need to be reconsidered.

BB. **Public shaming and labelling of citizens** by government officials contributes to lawlessness. Government officials and those in positions of authority need to be held to a higher standard. At the same time, governments should not be permitted to blatantly work against their populations.

CC. **Educators need to publicly defend** the precautionary principle for all children and youth.
8.2.7. COVID Impact on the Social Fabric

Recommendations

The discussion raises important concerns about the negative impacts of the federal government’s pandemic response on the fabric of Canadian society. These impacts encompass a wide range of areas, from personal freedoms and trust in institutions to economic, social, and health consequences. To prevent such issues from happening in the future, we put forth the following 12 recommendations.

A. National Crisis Oversight Council: Commission a study to determine the validity of setting up a National Crisis Oversight Council (NCOC), with a rationale and expected format as follows:

Rationale

Establishing the NCOC is essential to safeguarding democratic principles, protecting individual rights, and maintaining public trust during future emergencies, such as pandemics. The NCOC will serve as an independent, multidisciplinary body tasked with monitoring, policing, and investigating government actions during crises.

Basic Characteristics and Principles

- **Representation:** The NCOC will comprise representatives from diverse sectors of society, including law, medicine, science, faith, business, media, arts, and culture. Each member will undergo a public appointment process, with credentials and potential conflicts of interest transparently disclosed.

- **Subpoena powers:** The council will possess subpoena powers, allowing it to compel testimony and evidence from all sectors, including government officials, the judiciary, and other relevant stakeholders.

- **Public access:** To ensure transparency and accountability, the NCOC will offer the public direct and unfiltered access. A user-friendly platform will enable citizens to express concerns, provide observations, and access council proceedings.

- **Legislative clarity:** The powers and responsibilities of the NCOC will be clearly outlined in legislation, eliminating the need for regulatory details to be determined separately. This legal foundation will establish the council’s authority and scope.

- **Empowerment for change:** The NCOC will have mechanisms to influence government actions during emergencies. It will be empowered to make recommendations, demand corrective actions, and trigger public awareness campaigns when necessary. Its primary goal will be to uphold democratic values and individual rights and freedoms, and help ensure the wellbeing of citizens.
Media access: The council will be expected to have unrestricted access to all forms of media to maintain public trust and transparency. Regular briefings, reports, and public statements will keep citizens informed of its activities and findings.

Purpose and Benefits

The NCOC would be founded on the principle that a robust system of checks and balances is vital in times of crisis. Its purpose would be to:

- Safeguard democracy: Ensure that democratic principles are upheld during emergencies, preventing overreach and abuse of power.
- Protect individual rights: Safeguard citizens’ fundamental rights and liberties, even when extraordinary measures are deemed necessary.
- Maintain public trust: Enhance transparency and accountability in government actions, fostering public confidence in crisis management.
- Promote evidence-based decisions: Encourage government responses to be grounded in science, data, and expert advice.
- Support effective governance: Assist in identifying gaps and weaknesses in government responses—leading to more effective crisis management.
- Advance public discourse: Facilitate open dialogue between government, experts, and the public to promote informed decision-making.

In summary, the establishment of the NCOC would be a proactive response to ensure that during future emergencies, the rights and values of Canadian society are upheld. It strengthens democracy, promotes transparency, and empowers the public to actively participate in safeguarding their wellbeing and fundamental rights.

B. Transparency and honest communication: Governments should prioritize transparent and honest communication with the public during crises. Information about the nature of the crisis, measures being taken, and the expected duration of those measures should be clearly and consistently conveyed.

C. Accountability mechanisms: Establish mechanisms for holding public officials accountable for their decisions during crises. This includes oversight bodies that can review actions taken by governments and ensure they align with constitutional rights and freedoms.

D. Respect for constitutional rights: Safeguard constitutional rights and freedoms, even during emergencies. Governments should not infringe on these rights without clear and justifiable reasons, and any restrictions should be proportional and time-limited.
E. **Balanced approach**: Develop and implement a balanced approach to crisis management that considers public health alongside economic, social, and mental wellbeing. Decisions should be evidence-based and consider the broad spectrum of societal impacts.

F. **Community engagement**: Engage with communities, civil society organizations, and a wide range of experts in decision-making processes. Encourage open dialogue and ensure that policies and measures are sensitive to the unique needs and circumstances of different groups within society.

G. **Education and awareness**: Promote public education and awareness about public health measures, their rationale, and the expected outcomes. Informed citizens are more likely to be able to make informed decisions and hold officials accountable for their actions.

H. **Support for vulnerable populations**: Develop strategies to support vulnerable populations during crises—such as the homeless, those struggling with addiction, and victims of domestic abuse. Ensure that access to essential services is maintained.

I. **Healthcare infrastructure**: Invest in and strengthen healthcare infrastructure to ensure capacity and readiness for future public health emergencies. This includes resources for mental health services, addiction treatment, and domestic violence support.

J. **Mandatory ethics training for health care workers**: To enhance the ethical standards and ensure the protection of fundamental patient rights and access to care, we strongly recommend the implementation of annual mandatory ethics training for all healthcare workers. This training should apply to frontline, administrative, and managerial staff across the healthcare system, resulting in the following benefits:

- Ethical awareness: Annual ethics training will promote awareness of ethical principles, ensuring that all healthcare workers have a comprehensive understanding of their ethical responsibilities toward patients, colleagues, family members, and the healthcare system as a whole.

- Patient-centred care: Ethical training will underscore the importance of prioritizing patients’ wellbeing, rights, and dignity in all healthcare decisions and actions. It will reinforce the commitment to patient-centred care.

- Legal and regulatory compliance: Ethical training will help healthcare workers understand and comply with legal and regulatory requirements related to patient rights and access to care, reducing the likelihood of breaches and legal issues.

- Improved communication: Ethical training can enhance communication skills, fostering open and honest dialogue with patients and their families. This will contribute to better-informed decision-making and greater patient satisfaction.
• Crisis preparedness: In times of crises like the COVID-19 pandemic, healthcare workers will be better prepared to make difficult ethical decisions under pressure, ensuring that patient rights and access to care are upheld even in challenging circumstances.

• Accountability: Mandatory training establishes clear expectations and accountability for ethical behaviour. It provides a basis for addressing breaches and taking corrective actions promptly.

• Continual improvement: Annual training allows healthcare workers to stay updated on evolving ethical guidelines and best practices, facilitating a culture of continual improvement in patient care.

• Organizational culture: Ethical training can contribute to building a culture of respect, compassion, and integrity within healthcare institutions, benefiting both patients and staff.

K. **Scientific integrity**: Protect the integrity of scientific research and expert opinions. Encourage open debate and diverse perspectives within the scientific community to ensure that policy decisions are well informed.

L. **Legislative safeguards**: Review and update emergency powers legislation to strike a balance between swift response and protection of individual rights. Ensure that such powers are subject to regular parliamentary review and oversight.

In essence, the goal is to develop a comprehensive strategy that prioritizes the health and wellbeing of citizens while respecting democratic values, individual rights, and the resilience of Canadian society as a whole. These recommendations aim to foster a society where crises are managed with care, accountability, and a commitment to the long-term welfare of all citizens.
8.2.8. The Effects of Government Pandemic Measures on Faith Communities

Recommendations

A. **Recognition of all religions**, including the body of Christ Church, by all levels of government is paramount in a free and democratic society and must be afforded all protections and shields guaranteed under the *Criminal Code*, the *Constitution Act, 1867*, the *Bill of Rights*, and the *Canadian Charter of Rights and Freedoms*.

B. **Churches do not require the permission of governments** to open or close. However, when churches decided to respond favourably to the governments’ call—two weeks to flatten the curve—these same churches must also have had the decision-making authority to reopen when projected COVID death and illness numbers don’t come to fruition.

C. **Revisions of the Emergencies Act**. In May 2020, the launching of the *Emergencies Act* granted Cabinet powers to evacuate people and remove personal property from any specific area, acquire property, direct any person or any class of persons to render essential services, regulate distribution and availability of essential goods, services, and resources, authorize emergency payments, establish shelters and hospitals, and impose criminal sanctions. Moreover, the Act allows the federal government to essentially nationalize parts of the economy wherever it thinks it’s necessary, including Cabinet assuming the control, restoration, and maintenance of public utilities and services to ensure the wellbeing of Canadians.

Later, citizens witnessed governments creating travel passes to curtail movement under the *Emergencies Act*. There needs to be parliamentary and legislative revisions to the *Emergencies Act* in an effort to reduce the unprecedented sweeping powers of the federal government over provincial jurisdictions and the citizenry and the unbridled discretion of authorities and powers administering new criminal laws without established opportunities for redress.

D. **All governments should be required** to provide full disclosure of all the relevant data that led to the declaration of emergency measures, the degree of parliamentary oversight, the dialogue regarding the risks and legitimacy of the lockdowns, and how temporariness was factored into the invoking of the Act.

E. **Governments and public sector employees** by virtue of public funding must remain neutral. Freedom of religion is a protected right that supersedes the authority and actions of governments. Public policy can neither be discriminatory in how the law is applied. For example, all churches regardless of the number of congregants, the square footage of the building, or the ability for each individual church to accommodate citizens within the boundaries of ever-changing COVID restrictions were painted with the same brush. On its face, the essential and non-essential list of organizations afforded carte blanche government approval appears discriminatory, and therefore, should be challenged under human rights legislation.
F. **Remedy discriminatory conduct** through mandatory education programs. For example, the duty to accommodate is a legal concept that aims to ensure every citizen has equal access to benefits, services, and opportunities. In the context of the Canadian Charter of Rights and Freedoms, the duty to accommodate refers to the principle that individuals and groups should not be treated unfairly or denied opportunities because of their personal characteristics or religious beliefs. In fact, the duty to accommodate places a duty on all employers and service providers, including governments and institutions, to make reasonable adjustments to the policies and practices without unnecessarily imposing hardship on the legitimate interests of a workplace.

Throughout COVID, legitimate questions were ignored. Yet, discretionary discriminatory actions were evident, imposing undue hardship on those who requested religious accommodation. Therefore, mandatory religious education courses for all public sector employees to ensure citizens are not discriminated against for religious practices and beliefs would send a much-needed message to public sector employees who discriminately targeted men and women of faith.

G. **Going forward, there must be a clear**, evidence-based rationale for locking down citizens and society. And subsequently, when the *Emergencies Act* is revoked, there must be ample opportunities for redress, public conversations, and debate in the public square that will counter future restrictions on the citizenry.

H. **Criminal Code section 176** must be retained.

I. **Every individual has an inherent right** to end-of-life, spiritual and/or pastoral care or God at bedside services that align with their specific faith. Therefore, all publicly funded institutions, including hospitals, and long-term care facilities must comply.

J. **Courts must accept deeply held beliefs** for religious convictions and respect that not every citizen, when writing an affidavit to support their views, is familiar with conveying the breadth and depth of their convictions in a manner that would overwhelmingly influence the Court.

K. **The presumption of innocence** must be adhered to in all judicial proceedings occurring in every province and territory but Québec, where the latter operates under civil law. From the evidence, it appears prosecutors have too much influence on how the court uses its time. For example, the statement that constitutional arguments are a waste of court time and, therefore, should not be heard is not acceptable. Again, if a citizen’s constitutional rights have been violated by virtue of their personal beliefs, thoughts, opinions, or expression, the actions of governments must be called into account, or else the law is being brought into disrepute.

L. **Bail conditions must be reasonable and fair** and cannot prevent an individual from performing their employment duties and responsibilities. This includes pastoral service within a religious context.
M. **Separation of courts**, the separation of courts from the public service.

N. **Regarding procedural fairness and natural justice**, it’s time for a comprehensive national dialogue to take place involving the church and Canadians who firmly believe the church is foundational and necessary for the social and economic wellbeing within communities. The church is uniquely qualified and capable of making decisions that impact the social fabric.

O. **The prevailing belief** that there is a higher spiritual accountability in this life which determines our individual standing for eternal life cannot and should not be negated by government or judiciary.

P. **Churches and citizens are encouraged** to create a public policy watch for any legislation that potentially negates the rights and freedoms of faith groups. The attempt to silence religious speech over the last three years should not go unnoticed.
8.3. Economic Impacts

8.3.1. Impacts of Mandates on Small and Medium-Sized Businesses

Recommendations

A. Financial Support:

a) Simplify and expedite access to financial assistance programs, ensuring that small businesses can easily navigate the application processes.

b) Provide targeted financial aid to sectors that have been disproportionately affected.

c) Extend and expand wage subsidies to encourage businesses to retain employees and minimize layoffs.

B. Flexible Regulations:

a) Implement flexible regulations and licensing requirements to support businesses in adapting to changing circumstances and exploring new revenue streams.

b) Streamline bureaucratic processes to reduce administrative burdens on small businesses and expedite approvals.

c) In cases where governing authorities decided businesses were non-essential, there needs to be accommodation made to allow these businesses to reestablish themselves or in cases where the business has closed, gone bankrupt, et cetera, an understanding within the public service that this is not a consequence of the business owner not wanting to work but a direct result of decisions made by governing authorities.

C. Access to Capital and Credit:

a) Enhance access to affordable capital and credit for small businesses through low-interest loans, loan guarantees, or grant programs.

b) Collaborate with financial institutions to develop tailored financial products specifically designed to address the needs of small businesses during recovery.

D. Promote Local Online Shopping:

a) Encourage consumers to support local businesses by promoting the importance of shopping locally.

b) Develop and implement marketing campaigns to raise awareness of online platforms and e-commerce solutions that facilitate purchases from local businesses.
E. Training and Skill Development:

a) Offer training programs and workshops to small business owners and employees to enhance their skills in areas such as digital marketing, e-commerce, and remote work.

b) Collaborate with educational institutions and industry associations to develop training initiatives specifically tailored to the needs of small businesses.

F. Collaboration and Networking:

a) Facilitate networking opportunities among small business owners, allowing them to share experiences, insights, and best practices.

b) Foster collaboration between small businesses and larger corporations through partnerships, supplier diversity initiatives, or mentorship programs.
8.3.2. Impacts of Mandates on Canadian Citizens

Recommendations

A. **An independent judicial investigation** must be undertaken to determine responsibility and criminality. Any and all institutions, individuals, or organizations that were responsible for breaking of the law need to be brought to justice.

B. **Laws need to be strengthened** to specifically prohibit the mandating of medical procedures and the exposure of private health information. There are current laws in place, but somehow these laws did not protect Canadians.

C. **Canada must affirm its adherence** to international law and human rights and invite an investigation of the actions of the government according to these treaties.

D. **An intensive program** aimed at addressing the developmental damage done to our children must be undertaken and implemented immediately. It is not acceptable to simply move on with business as usual. Children have been emotionally, developmentally, and educationally damaged, and remedial actions are required.

E. **An investigation into the actions of the CBC** and privately held media companies in Canada must be undertaken to determine criminality under the current hate speech and terrorism laws in Canada. It was the relentless stream of hate, propaganda, and terror which was responsible for much of the damage done.

F. **All employees who were terminated** due to refusal to take a medical procedure must be rehired and paid compensation. All costs of these actions need to be paid for by the parties who mandated and implemented the terminations.

G. **The regulations concerning the operation of elderly persons’ care homes** need to be reformed. Never again should these institutions be allowed to lockdown, isolate, and ignore the needs of the residents and their relatives. Compensation needs to be paid and criminal charges laid as appropriate.

H. **A mandatory course on the Canadian Charter of Rights and Freedoms** is to be developed and become mandatory for all public service employees, as part of the effort to assure that these actions are never supported again.

I. **A high-school level course must be developed** to teach the Canadian Charter of Rights and Freedoms and civics to all high school students in Canada. This course must be mandatory nationwide.

J. **The history of what happened** during the pandemic, including an accounting of who was responsible, must be developed and included as a module in all high school history courses. This history is to be mandatory.
K. **Government officials**, the judiciary, and regulatory boards did not adequately safeguard the interests of Canadians. It is imperative to implement measures that establish civilian oversight for many of these institutions, ensuring their independence from political influence and interference.

L. **Financial Support**:

- Ensure efficient and accessible delivery of financial assistance programs to individuals impacted by the mandates, including those who have lost their jobs or experienced reduced income.
- Expand income support programs and consider targeted initiatives for vulnerable populations, such as low-income individuals, single parents, and seasonal economy workers.
- Provide rent and mortgage relief programs to ease the financial burden on individuals facing housing insecurity.

M. **Mental Health Support**:

- Increase access to mental health services, including telehealth options, to support individuals experiencing heightened stress, anxiety, and other mental health challenges.
- Implement public awareness campaigns to reduce stigma associated with seeking mental health support and promote available resources.
- Invest in community-based mental health programs and initiatives that address the specific needs of diverse populations.

N. **Educational Resources and Support**:

- Ensure access to remote learning resources and technologies for students to minimize educational disruptions.
- Provide additional support and resources for students from disadvantaged backgrounds to address students experiencing educational disparities and issues related to technology.
- Invest in educational and vocational training programs to support individuals in re-skilling or up-skilling to adapt to changing job market demands.

O. **Healthcare Access and Outreach**:

- Prioritize and expedite non-urgent medical procedures and screenings that were delayed or cancelled during the mandates to address healthcare needs and prevent further complications.
- Increase outreach efforts to promote preventive healthcare measures such as regular check-ups.
- Enhance access to telehealth services and digital health platforms to facilitate remote consultations and healthcare support.
P. **Community Support and Engagement:**
- Facilitate virtual community engagement initiatives to foster social connections, combat social isolation, and promote community resilience.
- Provide funding and resources to community organizations and non-profit groups that offer support services, food banks, and other essential resources for those in need.
- Encourage employers to prioritize employee wellbeing by implementing flexible work arrangements, promoting work-life balance, and supporting mental health initiatives.

Q. **Communication and Information Dissemination:**
- Ensure clear, consistent, and timely communication about public health guidelines, mandates, and available resources to keep citizens informed and reduce confusion.
- Utilize diverse communication channels to reach different segments of the population, including multilingual communication and accessibility measures for individuals with disabilities.
- Combat misinformation and promote evidence-based information through public health campaigns and collaborations with trusted sources.

R. **Long-Term Preparedness and Resilience:**
- Invest in healthcare infrastructure, including increased hospital capacity and resources, to improve pandemic preparedness and response capabilities.
- Establish contingency plans and strategies to manage future crises effectively, balancing public health priorities with minimizing social and economic disruptions.
- Foster collaboration between government, businesses, and community stakeholders to develop comprehensive and coordinated approaches for future emergencies.

By implementing these recommendations, the Canadian government and relevant stakeholders can provide support and assistance to citizens impacted by the COVID-19 interventions, helping individuals navigate the challenges, promote wellbeing, and build resilience during and beyond the pandemic.
8.3.3. Financial Impact of the COVID-19 Pandemic Response on Canada

Recommendations

A. **Restraints must be placed on public health officers.** They must be required to immediately justify their recommendations with legitimate cost–benefit analyses, and their decisions must be subject to the authority of publicly elected officials and the transparent scrutiny of the public.

B. **All scientific studies on either side** of a crisis must be made available to the public so that the effect of propaganda can be minimized.

C. **Public health officials should never be placed in charge** of an Emergency Response. Emergency Response must remain the purview of professionals trained in medical and emergency procedures who understand how to set goals and achieve them.

D. **Lockdowns and mandates** must require direct legislative authority. These steps cannot be allowed to be carried out under regulations.

E. **The media must be held to account** for their collusion in the propaganda that caused the panic among citizens and authorities.

F. **A detailed financial audit must be undertaken** on each and every dollar that was spent on the pandemic. It must be determined whether any mishandling of these funds occurred.

G. **Identify and prioritize essential expenditures** directly related to public health and safety, such as healthcare infrastructure and support for vulnerable populations.

H. **Evaluate the effectiveness and efficiency** of existing programs and initiatives to ensure resources are allocated wisely, redirecting funds from less effective areas to more impactful measures.

I. **Focus financial support** on the most affected sectors and individuals, such as small businesses, low-income households, and those facing unemployment or reduced income due to the mandates.

J. **Streamline administrative processes** to reduce red tape, bureaucratic delays, and associated costs, ensuring funds are disbursed promptly to those in need.

K. **Enhance transparency and accountability** in spending by providing regular public reporting on the allocation and utilization of funds, enabling citizens to monitor government expenditures.

L. **Invest in long-term emergency planning** and preparedness measures to mitigate the impact of future pandemics or health emergencies. This may include strengthening public health infrastructure, establishing emergency funds, and enhancing the capacity for rapid response and data collection.
M. **Ensure that future public health emergencies** are operated by the existing Emergency Management Apparatus and that the public health authorities provide input into that apparatus but are not able to lead or control it.

N. **Response to future public emergencies** must be driven by and directed by local emergency planning personnel on the ground and not driven by federal government political processes.

O. **Consider the potential cost-saving benefits** of investing in preventive healthcare measures, public health education, and research and development in the healthcare sector.

P. **Continuously monitor the effectiveness and impact** of government spending on COVID-19 mandates and measures, adjusting allocations as needed based on evolving circumstances, scientific evidence, and changing priorities.

Q. **Engage in rigorous and public evaluation** and assessment of programs and policies to identify areas of inefficiency or ineffectiveness, making data-driven decisions to optimize resource utilization.

R. **Focus on measures that stimulate economic recovery** and job creation, such as infrastructure investments, targeted incentives for business growth and innovation, and initiatives to promote consumer spending and tourism.

S. **Balance short-term relief measures** with long-term economic strategies to foster sustainable growth and resilience in the post-pandemic era.

T. **Canada must adopt a Canada First policy** where our national interest drives overall policy agendas. This applies to all aspects of our nation, including fiscal, financial, social and environmental policy. Global planning and response with a lack of Canadian input created the situation that we now find ourselves in.

U. **Canada is a country** whose economy is dependant on natural resource extraction and production. Canada must implement policies to upgrade and expand these core economic drivers so that export income can be quickly injected into the Canadian economy, addressing these historic debts caused by the government’s actions during the pandemic.

V. **Some of the damage and hardships** experienced by Canadians was caused by an acute lack of independence and diversity of critical aspects of our economy. Canada must rigorously review and apply the anti-combines laws (*Competition Act*) to limit Canadians exposure to undue influence from the many monopolies that currently exist across critical sectors of our economy.
By implementing these recommendations, governments can exercise restraint in spending while ensuring that essential needs are addressed, support is provided to those most affected, and long-term preparedness measures are in place. It is crucial to strike a balance between fiscal responsibility and the necessary investments to protect public health, support the economy, and promote the overall wellbeing of citizens.
8.4. Media Actions During the Pandemic

Recommendations

**CBC**
CBC as an organization must be held to account for their very damaging and dangerous actions. Significant steps must be taken to prevent this from ever happening again.

CBC was originally founded on November 2, 1936. Many of the principles under which the CBC was created and justified, no longer exist. With the advent of the Internet and the incredible reduction in the cost of creating quality content, the CBC no longer has a significant role to play in the promotion of Canadian content or the provision of media services to the rural and remote areas of Canada.

A. **The CBC should be stripped** to its very fundamental functions of providing information to Canadians with a special focus on French language and Indigenous issues. All other current functions and productions of the CBC must be terminated immediately.

B. **All current senior management positions** in the CBC must be removed in light of the revised operational mandate.

C. **Dismiss all on air staff that participated** in the dissemination of propaganda during the pandemic.

D. **Replace the CBC Ombudsmen** with a Board of Canadians chosen from across Canada, with two representatives chosen from each province and territory.

E. **The first task of the Board is to investigate** the origins and relationships with the government and industry that influenced the actions of the CBC during the pandemic.

F. **Remove the CBC from the “Trusted News Initiative”** and all other related organizations.

G. **One of the original functions of the CBC** was to support Canadian content, and as such they should return to that role but not to the role as imagined in 1932; it must realize the reality of the 21st century. As such, the CBC mandate would be to help Canadians to develop Canadian content. We propose the following:

   a. CBC facilities and equipment, et cetera, might be made available as a resource to private media developers.

   b. Utilize expertise that is currently embedded in the CBC to educate and provide training to private Canadian content producers.

   c. CBC should use its resources to promote real Canadian content produced by Canadians, not the CBC.
H. **A criminal investigation** must be undertaken to determine what areas of criminal hate speech law may have been violated based on the reporting of the CBC.

Other Traditional “Privately Owned” Media
Other traditional media outlets were as culpable as the CBC, but as private industry players, they do have the right to broadcast in accordance with the *Canadian Charter of Rights and Freedoms*. It would be extremely difficult to monitor their content on an ongoing basis, and it should not be the role of the government to regulate that content beyond required by current law.

A. **However, any and all direct government support** to these media entities must be stopped immediately. There is no reason for Canadian taxpayers to be supporting these entities. They are privately owned and as such must survive in the free marketplace as every other private business must.

B. **There is an uneasy monopolization** of traditional media that has occurred in Canada over the past 30 years. A complete investigation of the traditional media sources must be carried out under all federal legislation that deals with the development of monopolies in Canada.

C. **A criminal investigation must be undertaken** to determine what areas of criminal hate speech law may have been violated based on the reporting of the traditional media venues.

D. **Internet social media platforms** must not be censoring or editorializing content on their sites, unless the content is in contravention of the *Criminal Code*.

E. **The Broadcasting Act must be rewritten** to accurately reflect the broadcasting environment of the 21st century. The *Broadcasting Act* should not be used as a tool of the government to censor content or to advance the promotion and production of Canadian content. The act must endeavour to accurately set out the rules and regulations and remove interpretation or development of regulations by an unelected body such as the CRTC.

F. **The role of the CRTC must be reviewed**, and the CRTC possibly abolished if it is determined that the actual role of the CRTC is to simply develop regulations which are not specifically contained in legislation.

G. **Bolster press freedom** and other media communications protections by enacting comprehensive legislation and constitutional provisions in alignment with the *Canadian Charter of Rights and Freedoms*, which ensures and upholds the rights of free expression, access to information, and editorial independence.

H. **Safeguard journalists** from intimidation, harassment, and threats to their personal safety through effective law enforcement and judicial mechanisms.

I. **Ensure that public broadcasting organizations**, such as the Canadian Broadcasting Corporation, operate independently and are insulated from political interference with editorial decisions made by experienced journalists.
J. **Promote a diverse and inclusive media landscape** that reflects a wide range of perspectives and avoids undue concentration of ownership or control.

K. **Increase transparency** in the allocation and utilization of public funds provided to the public broadcaster. This includes clearly disclosing the criteria and decision-making processes for funding distribution.

L. **Establish independent bodies or committees** to oversee and evaluate the disbursement of public funds, ensuring accountability and preventing undue influence.

M. **Foster the development** of non-profit and community-based media organizations to diversify the media landscape and provide alternative sources of information and perspectives.

N. **Establish grant programs or tax incentives** to support the sustainability and growth of non-profit media outlets, enabling them to operate independently of government influence.

O. **Promote media literacy education initiatives** that equip citizens with critical thinking skills to evaluate media sources, distinguish between fact and opinion, and understand the importance of independent journalism.

P. **Promote adherence to professional journalistic standards and ethics**, including accuracy, fairness, and accountability.

Q. **Support self-regulatory bodies**, such as the Canadian Association of Journalists (CAJ).

R. **Enforce ethical guidelines** and provide recourse for individuals who believe they have been misrepresented or harmed by media coverage.

S. **Engage in international forums** and collaborations to advocate for press freedom and protect independent journalism globally.

T. **Support initiatives and organizations** that promote freedom of the press and other forms of media and provide assistance to journalists facing threats or persecution.

U. **Encourage citizen participation** and engagement in media governance, including public consultations, forums, and advisory panels, to ensure diverse perspectives and community interests are taken into account.

By implementing these recommendations, Canada can foster a media landscape that is independent, diverse, and accountable, serving as a cornerstone of democracy and providing citizens with reliable, unbiased information. It is crucial to uphold the principles of press freedom and support traditional media outlets in their role as watchdogs and providers of independent journalism.
8.5. Health

8.5.1. Pandemic Preparedness Plan

Recommendations

A. Rectifying the Mistake of Discarding the Emergency Management Plan: The decision to discard the Emergency Management Plan was a significant error that will require rectification.

B. Realigning the Purpose of Pandemic Measures: The objective of pandemic measures should have been to minimize the impact of SARS-CoV-2 on society, rather than solely focusing on safeguarding the healthcare system.

C. Utilizing Hazard Assessment for Targeted Responses: The Hazard Assessment, which continued to identify those most at risk, revealed that lockdowns did not effectively protect them. A more targeted response would have been more appropriate.

D. Learning from Past Pandemics: The lessons learned from previous pandemics were regrettably disregarded.

E. Reevaluating Non-Pharmaceutical Interventions (NPIs): The use of non-pharmaceutical interventions did not significantly reduce the spread of COVID-19. Employing them during the initial wave could have been seen as, at best, a mistake. After the first wave, it became a matter of grave concern.

F. Recognizing the Unintended Consequences of NPIs: NPIs have resulted in substantial collateral harm and loss of life, often surpassing the impact of the virus itself. Public health was aware of this prior to COVID-19, and yet no cost–benefit analysis was conducted. This constituted a grave error.

G. Holding Leaders Accountable: Public authorities bear responsibility for the response to the pandemic and the perpetuation of fear. Accountability should be enforced.

H. Safeguarding Our Society and Democracy: Failure to revise our Emergency Management Plan and dispel false beliefs in non-pharmaceutical interventions places our society and democracy in jeopardy.
8.5.2. Follow the “Science”: Real Science or Scientism?

Recommendations

Considering the critical reliance of our modern society on science and technology, there is a need to distinguish knowledge derived from the rigorous scientific method from beliefs often influenced by ideologies and propaganda. To help distinguish between the two, we recommend the following:

A. Basic training in epistemology and critical thinking should be incorporated into both humanities and scientific or technological education curricula.

B. Experts who participate in public forums should undergo scrutiny based on the following four fundamental criteria:

- Demonstrated cutting-edge knowledge and expertise, as evidenced by their involvement in past or ongoing scientific research, providing proof of their understanding of the subject under discussion.

- Lack of conflicts of interest.

- Willingness to engage in evidence-based public debates with other experts who may hold differing opinions. Such engagement should involve using rhetoric that avoids ad hominem attacks, appeals to authority, or invoking the mislabelled “scientific consensus.”

- The detailed, unedited credentials of these public figures must be made known and available to the public. This will enable the public to ascertain the credibility of such experts.
8.5.3. Epidemiology 101 in the COVID-19 Era

Recommendations
Due to the confusion caused by improper testing for COVID-19, particularly using unvalidated RT-PCR testing, the following recommendations were made:

A. **Pause the use of RT-PCR** or rapid antigen testing when it is not accompanied by a thorough medical evaluation of disease symptoms.

B. **Conduct a rigorous validation of RT-PCR testing**, including standardized cultivation of the active virus. Establish a defined threshold for the number of amplification cycles that show due used.

Considering the confusion that arose from the lack of transparency in official public data, the following recommendations are added:

C. **Ensure that all government data** is consistently and transparently shared with the public for independent evaluation by qualified experts in epidemiology and statistics.

D. **Make any disparities between data analysis**, done by the government and data analysis done by independent citizens, subject to review by an impartial advisory committee composed of experts in epidemiology and data analysis. This committee should be regularly vetted through public forums to maintain transparency and accountability.
8.5.4. Non-Pharmaceutical Interventions (NPIs)

Recommendations
In line with the “first, do no harm” principle and adhering to best medical practices and sound scientific practices, the following recommendations are proposed:

A. **Avoid mandatory health measures**, such as lockdowns and universal mask mandates, unless they have been objectively demonstrated through rigorous studies to have a positive benefit-to-risk ratio.

B. **Prioritize diligent implementation** of the two non-pharmaceutical interventions (NPIs) that have a well-established track record of efficacy in managing respiratory infections: air filtration and isolation of individuals who are both sick and contagious.

C. **Establish a targeted research and development program** to investigate the adverse effects of ineffective NPIs, with a specific focus on the impacts of masking children and restricting physical and social activities. The goal is to formally assess the extent of physical and mental health damage and propose tailored remediation measures.

D. **Ensure that scientists and healthcare professionals** working within government agencies have access to the best available scientific evidence, free from conflicts of interest, at both national and international levels. This access will enable them to provide politicians with the highest quality and most up-to-date knowledge for decision-making.

E. **Instead of prohibiting them, mandate scientific debates** to facilitate the emergence of optimal health measures. Encourage open discussions among experts to foster innovation and evidence-based policy-making.

F. **Actively promote healthy lifestyles** that can enhance the immune system through epigenetic mechanisms. A strong immune system forms the foundation for protection against infections, cancers, and autoimmune diseases.
Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada

8.5.5. Early Treatments

Recommendations
In line with the “first, do no harm” principle and adhering to best medical practices and sound scientific practices, the following recommendations are proposed:

A. **Avoid mandatory health measures**, such as lockdowns and universal mask mandates, unless they have been objectively demonstrated through rigorous studies to have a positive benefit-to-risk ratio.

B. **Prioritize diligent implementation** of the two non-pharmaceutical interventions (NPIs) that have a well-established track record of efficacy in managing respiratory infections: air filtration and isolation of individuals who are both sick and contagious.

C. **Establish a targeted research and development program** to investigate the adverse effects of ineffective NPIs, with a specific focus on the impacts of masking children and restricting physical and social activities. The goal is to formally assess the extent of physical and mental health damage and propose tailored remediation measures.

D. **Ensure that scientists and healthcare professionals** working within government agencies have access to the best available scientific evidence, free from conflicts of interest, at both national and international levels. This access will enable them to provide politicians with the highest quality and most up-to-date knowledge for decision-making.

E. **Instead of prohibiting them, mandate scientific debates** to facilitate the emergence of optimal health measures. Encourage open discussions among experts to foster innovation and evidence-based policy-making.

F. **Actively promote healthy lifestyles** that can enhance the immune system through epigenetic mechanisms. A strong immune system forms the foundation for protection against infections, cancers, and autoimmune diseases.
8.5.6. Natural Immunity & Early Treatments Rebuffed to Favour Generalized Vaccination

Recommendations

We recommend the suspension of any further vaccination for COVID-19 until (1) the issues of cGMP production are resolved; (2) the genotoxicity, auto-immunogenicity, and tumorigenicity assays are conducted to the appropriate level for gene therapy products; and (3) rigorous RCTs demonstrate the reduction of morbidity and mortality in a representative population, including the most vulnerable.

Given that there was no efficacy study in the RCT with the mRNA-LNP produced in the commercial manufacturing process and that there were irregularities in the clinical trial process, we recommend that Health Canada require an independent audit of the RCT.

Victims have to be compensated more readily. We also recommend that the government set up a special centre to take care of the vaccine-injured.

Regulatory agencies must revisit the warp-speed-development mindset of the COVID-19 genetic vaccines and rebut the allegation that the mRNA-LNP products have been proven safe and effective and that they can therefore be further used as a vaccine platform for other diseases without proper safety testing.

A Pandora’s box has been opened, and promoting any future products based on that mRNA-LNP platform technology for expedited marketing, within one year, without the proper efficacy and safety assessment will only perpetuate bad health outcomes of similar magnitude.

In alignment with the views of numerous medical doctors and scientists worldwide, the following recommendations are made:

A. **Immediately halt the use of experimental mRNA-LNP** gene therapy injections for COVID-19 prevention.

B. **Approve any future applications of these injections through** the standard gene therapy product approval process.

C. **Ensure that the regulatory approval process** and recommendations by vaccine immunization committees are reviewed by independent medical and scientific advisory committees without conflicts of interest.

D. **Establish clear safety signal thresholds** that would necessitate the automatic removal of any vaccine or therapeutic product from the market, with legal accountability for officials failing to adhere to these pre-established norms.

E. **Acknowledge, treat, and adequately compensate individuals** who have experienced vaccine-related injuries.
8.5.7. Interim Authorization of COVID-19 Vaccine

Recommendations

A. Newly implemented revisions to the Food and Drug Regulations related to the authorization of COVID-19 genetic vaccines must be rescinded as they permanently exempt COVID-19 vaccines from the requirements to objectively prove the safety or efficacy as required under the Food and Drug Regulations.

B. The current use of COVID-19 genetic vaccines in Canada that were authorized under the revised provisions of the Interim Order and the newly revised Food and Drug Regulations should be stopped immediately.

C. A full judicial investigation of the process under which the COVID-19 vaccinations were authorized in Canada must be carried out. Criminal liability, if discovered, may be dealt with under existing Canadian law.

D. All documentation concerning the authorization process and information provided to the regulatory agencies by the manufacturers should be made publicly available.

E. Legislation should be developed, or amended, to prevent the elimination of the legal requirements to prove that a new drug is objectively safe and that the efficacy of that drug is objectively proven.

F. The requirement for the regulatory board to carry out a risk–benefit analysis for any and all new drugs under consideration for approval should be codified into law. Written minimum requirements for such a review are to be established. The final decisions should be made on the basis of citizen health considerations not political motivations. The results of the risk–benefit must be made public.

G. We should review and revise the current relationship between licensing fees paid by pharmaceutical companies and the total budget allocated to Health Canada for drug-related matters. This is necessary to prevent pharmaceutical companies from exerting undue financial influence on the approval agency.

H. Legislation must be included or revised which re-establishes Canada’s approval agency as an independent, fact-based agency without reliance on approval agencies from outside of Canada.

I. Investigate any perceived or existing conflicts of interest that may exist between senior staff of Health Canada and pharmaceutical manufacturers. This may extend to a prescribed time limit prohibition of government agency staff from leaving government service for positions with the pharmaceutical manufacturers.
J. **All investigations recommended in this section** are to include the power to compel timely production of information and the power to subpoena witnesses.
8.5.8. Canada’s Future Approval of New Pharmaceuticals

Recommendations

A. **Revocation of New COVID-19 Regulations:** The Commission recommends that the new regulatory process be revoked and that Health Canada return to approving all therapeutics on its historical safety requirements.

B. **Maintain Rigorous Safety Standards:** Prioritize patient safety by maintaining rigorous safety standards for drug approval. The safety of new pharmaceuticals should be thoroughly demonstrated through preclinical and clinical trials before approval.

C. **Transparency in Regulatory Changes:** Ensure transparency in any regulatory changes related to pharmaceutical approvals. Changes in the approval process should be subject to public consultation and should be clearly communicated to stakeholders, including healthcare professionals and the public.

C. **Independent Expertise:** Appoint experts with relevant medical and scientific backgrounds to key positions in the regulatory process. Decision-makers, such as the Minister of Health, should have a strong understanding of medical and scientific principles to make informed decisions about drug approvals.

D. **Balancing Innovation and Safety:** Find a balance between promoting innovation and ensuring safety. While innovation is important for advancing healthcare, it should not come at the expense of patient safety. Consider the potential long-term effects of novel drugs on public health.

E. **Monitoring and Post-Market Surveillance:** Strengthen post-market surveillance of approved pharmaceuticals. Continuous monitoring of drugs once they are on the market is crucial to detect and address any safety concerns that may arise over time.

F. **Independent Safety Review:** Establish an independent body or commission responsible for conducting safety reviews of pharmaceuticals, especially novel biologics and gene therapies. This body should be free from industry influence and focused solely on patient safety.

G. **Public Health Impact Assessment:** Conduct thorough assessments of the potential public health impact of new drugs, particularly in the context of pandemics or health emergencies. Consider both short-term and long-term consequences on public health.

H. **Ethical Considerations:** Incorporate ethical considerations into the approval process. Ensure that the potential benefits of new pharmaceuticals outweigh the risks and that patient autonomy and Informed Consent are respected.
I. **Regular Reviews of Regulatory Frameworks**: Periodically review and update regulatory frameworks to adapt to advances in medical science and changing public health needs. Regulatory changes should prioritize safety while facilitating timely access to beneficial treatments.

J. **International Best Practices**: Benchmark Canada’s regulatory processes against international best practices. Learn from the experiences of other countries with strong pharmaceutical regulatory systems.

K. **Public Awareness and Education**: Enhance public awareness and education about the drug approval process, including the rigorous testing and safety measures in place. Informed patients can make better decisions about their healthcare.

L. **Monitoring Economic Impact**: While promoting economic development is important, closely monitor the economic impact of regulatory changes. Ensure that economic goals do not compromise patient safety, and make necessary adjustments if conflicts arise.

These recommendations aim to strike a balance between promoting innovation and safeguarding patient safety in Canada’s pharmaceutical approval process. It’s crucial to prioritize public health and long-term safety while fostering an environment conducive to innovation and economic growth in the pharmaceutical industry.
8.5.9. Medical Practice and Ethics During COVID-19

Recommendations

A. A civilian-led detailed investigation must be carried out to determine who (at all levels) were responsible for these breaches of medical ethics and to recommend criminal investigations as appropriate.

B. Existing senior members of healthcare regulatory agencies responsible for the abandonment of long-held and honoured principles of medical care should, as appropriate, stand criminal investigation.

C. Each province and territory, including the federal government must establish civilian control and oversight to the existing regulatory agencies, including regularly scheduled and publicly available reviews of their activities. These appointments cannot be politically motivated and should be carried out in public with real input from citizens.

D. Each Province must Establishment of an office of the independent Ombudsmen available to both practitioners and patients.

E. Develop laws making it illegal to deny elderly residents of care facilities from seeing visitors.

F. Regulatory Agencies must Enforcement of existing laws concerning patient confidentiality, requirement for Informed Consent, and the level of care that is required by each healthcare professional.

G. Establish laws ending centralized control of individual patient care. Patient care is a matter between a patient and their healthcare provider. This relationship cannot be violated through central government planning edicts. The public health service should never be directing patient care, which is a personal matter between the healthcare provider and the patient.

H. Ensure that RAW data is promptly and fully disclosed, eliminating the necessity for Freedom of Information Act (FOIA) requests and associated fees, especially when such requests come from patients or researchers.

I. Mandatory independent experts must be added to all panels who are screened for conflict of interest.

J. There must be a criminal investigation of the manufacturers and distributors of any of the vaccines that were administered to the public under false and misleading information. If manufacturers and distributors are found to have acted inappropriately, they should bear the costs of these investigations, as well as any damages assessed. The burden of investigation expenses should be placed on the guilty parties.

K. Ensure Protection for healthcare professionals and journalists acting in good conscience.
L. **No removal of liability protections** against manufacturers and regulators.

M. **Strengthen the requirement** for healthcare practitioners to independently review and approve of any treatment or procedure that they are recommending to a patient.

N. **Establish an annual requirement** for medical ethics training for all healthcare providers; this should be a career long requirement and may be made up of several modules completed through a multi-year process.

O. **Political figures who are responsible** for the implementation of these mandatory programs must be held accountable in an open and public forum.

P. **All members of the committees** that implemented the mandates must be exposed to the public, including all records of internal discussions and recommendations. An investigation into these actions needs to be carried out and if criminal, unethical, or incompetent actions are identified, punitive actions must be implemented.

Q. **Develop and regularly update comprehensive ethical guidelines** and standards that cover a wide range of medical and healthcare practices, including areas such as consent, confidentiality, end-of-life care, resource allocation, and conflicts of interest.

R. **Ensure that ethical guidelines are widely accessible** to healthcare professionals, patients, and members of the public, fostering transparency and accountability.

S. **Establish and support institutional ethics committees** in healthcare organizations, consisting of diverse stakeholders, including healthcare professionals, ethicists, legal experts, members of the public, and patient representatives. Empower these committees to provide guidance, consultation, and ethical review of complex cases, research protocols, and policy development.

T. **Strengthen practices and policies that ensure patients’ rights** to make informed decisions about their healthcare, including the right to refuse treatment, access their medical records, and participate in shared decision-making.

U. **Promote clear communication** between healthcare practitioners and patients to enhance understanding and respect for patient autonomy.

V. **Safeguard patient confidentiality and privacy** by maintaining strict protocols for the storage, access, and sharing of medical information, in accordance with applicable laws and regulations.

W. **Provide ongoing education and training** to healthcare professionals on the importance of maintaining patient confidentiality and the potential implications of breaches.

X. **Ensure rigorous ethical review processes** for research involving human subjects, promoting Informed Consent, minimizing risks, protecting vulnerable populations, and upholding the principles of beneficence and nonmaleficence.
Y. **Support the work of Research Ethics Boards (REBs)** in reviewing research proposals, monitoring ongoing studies, and ensuring compliance with ethical guidelines.

Z. **Foster a culture of ethical leadership** and professional conduct in healthcare organizations, emphasizing integrity, honesty, empathy, and accountability at all levels.

AA. **Establish mechanisms to address and investigate** ethical misconduct or breaches of professional standards, ensuring appropriate consequences and opportunities for remediation.

BB. **Engage patients and the public in discussions** and decision-making processes related to medical ethics, promoting shared decision-making and incorporating diverse perspectives.

By implementing these recommendations, Canada can maintain and strengthen medical ethics, ensuring the highest standards of patient care, while fostering trust between patients and healthcare professionals and upholding the ethical principles that underpin the healthcare system. Regular review, continuous education, and engagement of stakeholders are vital to address evolving ethical challenges and promote ethical behaviour in the medical field.
8.5.10. Canada's Vaccine Adverse Reactions Reporting System

**Recommendations**

To improve the vaccine adverse reporting system, several recommendations must be considered:

**A. Enhance Healthcare Provider Education and Awareness:**

- Provide comprehensive education and training to healthcare providers on the importance of adverse event reporting, including the recognition and reporting of vaccine-related adverse events.
- Streamline the reporting process to make it more user-friendly and efficient.
- Provide mandatory ongoing education of public health officials to provide insights into the risks associated with novel drug implementation so that they understand the difference between traditional vaccine-type medications and new biologic medications.
- Ensure that on the release of any new drug that all parties involved with the administration or monitoring are fully aware of the actual nature of the drugs under consideration. Some of the shortfalls in the system during COVID-19 had to do with a lack of understanding concerning the nature of these injections.
- Provide re-education for colleges of physicians and surgeons across Canada on the principle behind procedures required and the importance of the adverse event monitoring system.

**B. Promote Public Awareness and Engagement:**

- Launch public awareness campaigns to educate the general public about the importance of reporting vaccine adverse events.
- Provide accessible information on how and where to report adverse events, emphasizing the role individuals play in vaccine safety monitoring.
- Provide a portal through which patients can directly report their alleged vaccine injuries to the system.
- Encourage vaccine recipients and caregivers to report any adverse events they observe following vaccination.

**C. Improve Reporting Infrastructure:**

- Develop user-friendly online reporting platforms or mobile applications to simplify and streamline the reporting process for healthcare providers and the public.
- Ensure reporting mechanisms are easily accessible, with clear instructions and options for reporting adverse events, including user-friendly interfaces and multilingual support.
D. Implement Active Surveillance Systems:

- Augment passive surveillance systems with active surveillance components to actively identify and monitor adverse events, especially rare or serious events that may be missed through passive reporting alone.

- Augment passive surveillance systems with active surveillance components to actively identify and monitor patient complaints and trends or patterns of patient complaints following a drug rollout.

- Implement proactive strategies, such as automated electronic health record data mining, to identify potential safety signals and conduct targeted investigations.

E. Strengthen Collaboration and Data Sharing:

- Foster collaboration between different stakeholders, including healthcare providers, public health agencies, vaccine manufacturers, and research institutions, to facilitate seamless data sharing and exchange of information.

- Immediately end the practice of public health officials directly contacting patients and advising them to undertake medical procedures contrary to the attending physician’s instructions.

- Enhance integration between national and international vaccine safety networks to leverage collective expertise, share best practices, and collaborate on investigations of global vaccine safety concerns.

F. Ensure Timely Analysis and Communication of Findings:

- Prioritize timely analysis of reported adverse events to identify potential safety signals promptly.

- Ensure that those evaluating the data are capable of recognizing and analyzing the data, despite their professional biases.

- Ensure clear and transparent communication of findings to healthcare providers, the public, and other relevant stakeholders, while considering the balance between timely communication and the need for thorough investigation.

G. Continuous Evaluation and Improvement:

- Regularly assess the performance and effectiveness of the reporting system, including feedback from healthcare providers, the public, and other stakeholders, to identify areas for improvement.

- Incorporate advancements in technology and data analytics to enhance the efficiency and accuracy of adverse event reporting and analysis.
By implementing these recommendations, the vaccine adverse reporting system can become more robust, efficient, and responsive, leading to improved vaccine safety monitoring and better protection of public health.
8.5.11. Delivery of Healthcare Services During the Pandemic

Recommendations

Based on the experience of the COVID-19 pandemic in Canada, several recommendations could be made to improve the healthcare system and prevent similar disruptions to normal healthcare services in the future.

These recommendations focus on building resilience, preparedness, and adaptability in the healthcare system. Here are some key suggestions:

A. **Ensure Proper Emergency Response, Planning, and Implementation:** Public health officials are not trained in the planning and implementing of national integrated emergency response to major public health emergencies. In future, the responsibility for planning and implementing such emergency plans must be undertaken by the emergency measures organizations that already exist for this purpose. Public health must play an active role as technical consultant to the Emergency Measures apparatus but should never be placed in control of it.

B. **Invest in Healthcare Infrastructure:** Strengthen the healthcare infrastructure by first rationalizing the current inventory and capacity of the system, and then increasing the capacity of hospitals, clinics, and healthcare facilities, if required. This may include investing in more beds, medical equipment, and essential supplies to handle potential surges in patient volumes and designating alternative facilities and mechanisms to share resources across provincial jurisdictions.

C. **Enhance Telehealth Services:** Expand and promote telehealth services to provide virtual consultations and healthcare support. Telehealth can reduce the burden on physical healthcare facilities, increase accessibility to healthcare services, and ensure continuity of care during emergencies.

D. **Improve Data Collection and Analysis:** Establish a robust data collection and analysis system to monitor healthcare resources, disease outbreaks, and public health trends. Timely and accurate data can help inform evidence-based decision-making and resource allocation during crises.

E. **Maintain Strategic Stockpiles:** Create and maintain strategic stockpiles of essential medical supplies, including personal protective equipment (PPE), ventilators, and medications. These stockpiles can help mitigate shortages during emergencies and protect healthcare workers.

F. **Support Healthcare Workforce:** Ensure the wellbeing and resilience of healthcare workers by providing mental health support, appropriate training for handling emergencies, and fair compensation. A strong and supported workforce is crucial in times of crisis.
G. **Improve Collaboration and Communication**: Enhance coordination and communication between federal, provincial, and territorial governments, as well as with healthcare providers and public health agencies. Effective communication channels can facilitate rapid response and the dissemination of critical information.

H. **Pandemic Preparedness Plans**: Develop and regularly update comprehensive pandemic preparedness plans at all levels of the healthcare system. These plans should outline specific strategies and protocols for managing various types of pandemics and health emergencies.

I. **Training and Dissemination of Plans**: As seen during the COVID-19 pandemic, existing plans were sidelined and many healthcare workers were not aware of the existence of any plans. Emergency plans must be distributed widely and reviewed with healthcare workers at all levels, and the public should have access to seminars and information sessions. The best plan in the world if unseen and unrehearsed is useless.

J. **Public Health Education and Awareness**: Strengthen public health education and awareness programs to inform the general population about disease prevention, natural immune system upkeep, and appropriate healthcare-seeking behaviour during outbreaks.

K. **Supply Chain Resilience**: Diversify and strengthen the supply chain for essential medical equipment and pharmaceuticals to reduce dependence on foreign suppliers and minimize disruptions during global crises.

L. **Regional Response Capacity**: Establish regional response capacities to handle healthcare crises, allowing for more focused responses in areas heavily affected by outbreaks while maintaining healthcare services in other regions.

M. **Long-Term Care Facilities**: Implement improved infection control measures in long-term care facilities to protect vulnerable populations during outbreaks and prioritize their healthcare needs.

N. **Flexible Healthcare Services**: Develop flexible healthcare service models that can quickly adapt to changing circumstances. This could involve creating mobile healthcare units, flexible staffing arrangements, and alternative care facilities during emergencies.

Implementing these recommendations requires a collective effort from governments, healthcare providers, communities, and individuals. By learning from the challenges faced during the COVID-19 pandemic and taking proactive measures, Canada can enhance its healthcare system’s resilience and better protect the health and wellbeing of its citizens in the face of future health emergencies.
8.5.12. Public Workplaces and Pandemic Measures

Recommendations

A. **Employers mandating vaccinations** for all employees in the workplace must provide verifiable data proving vaccine safety and efficacy, outlining the risks and benefits, including any and all adverse effects and provide employees with satisfactory options in the event of vaccine hesitancy and/or refusal.

B. **Ensure employers’ duty** to adequately train staff in workplace health and safety procedures and to inform supervisors and managers of their respective responsibilities includes establishing the importance and applicability of all related legislation, including the *Canada Constitution, 1867*, and specific Acts such as the *Personal Health Information Act*.

C. **Unions have an obligation** to balance employee protections with arbitrary decisions and compliance orders made by employers. Unions must be required to undertake an exhaustive inquiry of the facts contributing to a grievance particularly when the complaint involves personal choice, bodily autonomy, constitutional protections, and the right to refuse unsafe work conditions.

D. **When employer-employee conflicts arise** from employer mandates requiring vaccination, the union must intervene with the intention of seeking a satisfactory resolution, inclusive of reviewing employer policies and collective bargaining agreements relating to sick leave and disability benefits to determine eligibility [re: extenuating circumstances].

E. **Terminated unvaccinated claimants** who were denied EI benefits based on misconduct must have their files re-assessed to determine whether the alleged breach in the employer-employee relationship came about because of employer forced mandates, coercion, and a person’s right to choose bodily autonomy; a new decision must be rendered.

F. **Ensure affirmative defences** are available for all employees working in publicly funded institutions, including transparent appeal processes.

G. **When non-arm’s length publicly funded agencies** enter into a partnership [such as the partnership between CBS and the Public Health Agency of Canada], there should be legislative assurances that the objectives of the newly intertwined relationships are not contradictory.
8.5.13. Alleged Denial of Medical Treatment Due to Pandemic Measures

Recommendations

To prevent situations such as the one faced by Ms. Sheila Lewis from arising in the future, a comprehensive, balanced, and transparent approach needs to be taken. The Commission makes the following recommendations:

A. **Effective Communication and Education:** Both healthcare providers and patients must be committed to effectively communicating with each other. Given the grave consequences of any decisions made, each side must be committed to educating themselves with ALL SIDES of the discussion, which also requires listening to and understanding alternative opinions, and a mandatory review of the latest information available. This must be combined with a detailed and comprehensive list of objective reasons for any decision being made. Following policy is not a defence.

B. **Policy Review and Transparency:** Vaccination policies within healthcare institutions should be regularly reviewed and updated based on evolving scientific evidence. The reasoning behind these policies should be transparent and easily accessible to patients. Policies should be implemented in a non-discriminatory manner and should consider unique circumstances and exceptions.

C. **Ethics Consultations:** Complex decisions involving individual rights and public health should involve consultation with ethics committees. These independent bodies can provide guidance on balancing the competing values at stake, ensuring that any decisions made are fair and respectful of patients’ rights.

D. **Legal Framework:** Legislation should clearly outline the rights and responsibilities of patients and healthcare providers in the context of public health interventions like vaccinations. Clear legal guidelines can help prevent potential abuses and ensure that individuals’ rights are respected and protected.

E. **Patient Advocacy:** Encourage and support the role of patient advocates who can provide a voice for patients, ensuring that they understand their rights and are adequately represented in discussions about their healthcare.

F. **Psychosocial Support:** Provide support services for patients who may be experiencing distress or facing potential discrimination due to their vaccination status.

G. **Community Engagement:** Engage with communities to understand their concerns and attitudes towards vaccination. This can inform more effective communication strategies and foster trust.
H. “Citizen Overview Committee” or “Public Health Review Board”: Establish independent review boards to provide an additional level of oversight and accountability for public health decisions, ensuring that these decisions balance public safety with individual rights. Here’s how such a committee might operate:

- **Composition**: The committee should be comprised of diverse representatives from various backgrounds, including but not limited to healthcare, public policy, law, ethics, social work and patient advocacy. Members should include individuals from different age groups, socioeconomic statuses, ethnicities, and professional backgrounds to ensure a broad range of perspectives. Importantly, the committee should include members of the public who can represent the citizens’ perspective. Each province should be required to set up these boards.

- **Operation**: The committee should be convened quickly in response to situations that warrant review. This requires a streamlined protocol for initiating reviews and an efficient method of communication among committee members. Given the urgency of public health decisions, the committee should aim to conclude reviews and deliver a decision within 21 days or less, depending on the situation.

- **Authority**: The committee should have a clearly defined mandate, including the power to request documents, to call witnesses, and to access relevant information. The decisions of the committee should be advisory but carry significant weight in policy decisions.

- **Transparency**: The committee’s deliberations should be conducted with a high degree of transparency, while respecting necessary privacy laws. Decisions should be publicly accessible, and the reasoning behind each decision should be clearly explained.

- **Training**: Committee members should receive training to equip them with the necessary skills and knowledge to effectively review public health policy decisions. This could include training in healthcare ethics, public health policy, legal aspects of healthcare, and conflict resolution.

- **Review and Accountability**: The operation of the committee should be periodically reviewed to ensure that it is fulfilling its mandate effectively. This could involve surveys of stakeholders, review of decisions, and an analysis of the impact of the committee’s recommendations.

The justification for a Citizen Overview Committee for public health decisions hinges upon several key democratic principles: representation, accountability, transparency and promotion of the public good.

- **Representation**: Democracy operates on the principle of “government by the people, for the people.” Having decisions that affect public health made by (or under the review of) the very individuals it impacts ensures that a diverse range of perspectives and experiences are considered. This can lead to more balanced and equitable policy outcomes.
• **Accountability**: Public officials, even if unelected, should be accountable to the citizens they serve. A Citizen Overview Committee provides a mechanism for holding these officials accountable for their decisions. This creates a system of checks and balances, ensuring that public health decisions are being made in the best interest of the community.

• **Transparency**: The decision-making process should be transparent to the public. This fosters trust in the system and ensures that policies are implemented fairly and with clear justification. A Citizen Overview Committee, particularly one that makes its findings public, promotes this transparency.

• **Promotion of the Public Good**: Public health decisions should be aimed at promoting the public good. However, the definition of “public good” can vary widely among individuals and communities. A Citizen Overview Committee helps to define the public good in a way that reflects the values and needs of the community.

• **Accessibility and Inclusion**: The committee ensures the voices of marginalized or underrepresented groups are heard in policy-making. This can lead to more inclusive decisions that consider the impacts on all community members.

By basing public health decision-making in democratic principles, a Citizen Overview Committee can ensure that policies are equitable, just, and truly reflective of the community's needs and values. This approach provides a mechanism to challenge and rectify decisions that may be deemed as unduly harmful or unfair, fostering greater trust and cohesion within the community.

This type of committee could help to ensure that public health policy decisions are subject to rigorous and transparent review, thereby increasing public trust and ensuring a more balanced approach to managing public health crises.

Preventing situations like this from arising in the future requires a commitment and concerted effort from healthcare providers, policymakers, and the community. An approach that respects individual rights while protecting public health is essential. It is a vital and delicate balance, but with empathy, transparency, and open dialogue, it is fully achievable.
9. Conclusions

Anyone who participated in the hearings or watched even a small fraction of the more than 300 recorded testimonies will have been changed forever. Many of the testimonies were heartbreaking, shocking, and often terrifying. Over the 24 days of hearings, witness testimonies provided an overall sense of how Canada has been transformed by the actions of all levels of government to address the pandemic.

The transformation from what was once considered unthinkable -- e.g. sweeping restrictions of Charter rights -- to the acceptance of draconian government lockdowns within a span of just three years is indeed a remarkable phenomenon.

The testimonies objectively demonstrate that an unprecedented attack has been carried out on the citizens of Canada and that not since World War II have so many Canadian lives been lost due to a single aggressive attack on its peoples.

It is important to appreciate that this statement is based on sworn testimony of the events and experiences described by the witnesses and that these testimonies, as incredible as they are, do not fully capture the full breadth of the events that took place over the past three years.

The COVID-19 pandemic, which began in late 2019, presented governments worldwide with an unprecedented opportunity to change the direction of their nations. With the official excuse to contain the spread of the virus and prevent healthcare systems from being overwhelmed, many countries resorted to implementing strict lockdown measures.

These measures, which included widespread business closures, travel restrictions, and stay-at-home orders, were initially introduced as temporary and emergency measures to mitigate the immediate impact of the virus.

In the early stages of the pandemic, there was a widespread sense of urgency and fear surrounding the unknown nature of the virus. Government public health experts, and citizens, were grappling with the need to balance public safety with individual freedoms. The severity of the situation, as described in government propaganda and daily state media broadcasts, led to a general willingness among the population to accept stringent measures as a necessary evil.

During these early stages, the stated primary goal was to flatten the curve and prevent healthcare systems from collapsing under the strain of a sudden surge of COVID-19 cases.

Based on the biased and inaccurate propaganda being presented to the public, the notion of lockdowns seemed logical and justifiable to curb the rapid transmission of the virus. Moreover, because early effective treatments were suppressed in favour of new experimental genetic therapy vaccines, the need for non-pharmaceutical interventions appeared to be necessary.
Testimony from experts confirmed that by late March of 2020, the government already knew the true nature of COVID-19. They knew that it primarily affected the elderly with serious comorbidities, and they knew it was not unusually deadly or virulent.

However, governments persisted in their imposition of emergency measures, and as time went on, the long duration of lockdowns and their impact on daily life began to generate debate and dissent. Economies suffered severe contraction and losses, businesses closed permanently, and livelihoods were disrupted. The societal and psychological toll of prolonged lockdowns became increasingly apparent as people grappled with issues such as mental health, educational challenges, and social isolation.

Governments undertook unprecedented levels of spending, and the impacts of all of this debt will impact generations of Canadians to come.

Thousands of people lost their lives due to fear, loneliness, depression; the postponement or lack of medical care; or from adverse reactions to an experimental biologic injection.

People were so terrified by the government propaganda that they turned on each other; friends, families, and communities were torn apart. The government dehumanized large identifiable groups and, in so doing, encouraged a toxic and dangerous environment. As a result, the incidence of suicide, violence, and despair increased to unprecedented levels.

As the pandemic persisted, there were differences in the approach to lockdowns among various countries. Some nations adopted more targeted and localized measures, while others implemented broad and strict nationwide lockdowns. These varying approaches contributed to a diverse range of experiences and public perceptions.

Citizens began to undertake their own research and come together. They realized that standard practices which had stood the test of time had been discarded and replaced by ill-thought-out, ridiculous, and ineffective mandates.

Although governments had done extensive emergency planning well in advance of 2020, these emergency plans were simply discarded, and those professionals who were trained to implement emergency measures were sidelined.

In summary, the normalcy of once-unthinkable draconian government lockdowns within a relatively short period can be attributed to a focused campaign of propaganda and false information produced by government--and their partners in media and big business--to promote COVID-19 as a terrifying pandemic.

They used this excuse of combatting a novel virus, combined with fears of overwhelming the healthcare systems, to persuade the public to accept these measures.

However, as time progressed, the long-term consequences and societal costs associated with prolonged lockdowns could no longer be hidden from the public.
These are incredible claims to make, and just three years ago they were unthinkable. Once the reader has had the opportunity to thoroughly read this report and watch the video-recorded testimonies, there is no escaping the validity of these assertions.

Accountability for these alleged crimes must be rendered.
10. Commissioners’ Statement

10.1. A Message to Canadians

Dear Fellow Canadians,

We, the Commissioners of the National Citizens Inquiry, address Canadians today with a message of empowerment, urging you to recognize the immense power you hold to shape the destiny of our great nation.

It is time to embrace our collective responsibility and take control of our government. Working together, we can create the kind of society that we can be proud to pass on to future generations.

As we collectively awaken to the cold realization of the magnitude of government acts against us, we must ensure that the horror that we all lived through can never happen again.

But it is up to you--not your representatives, not the party, not the other person. It is up to you.

Canada is a land of vast potential, blessed with abundant resources, diverse cultures, and a tradition of compassion and inclusivity. Yet, we find ourselves at a critical juncture where challenges and opportunities abound.

Our collective lips may be bloodied, but we are not defeated. We may be shamed, but we cannot turn away from the horror of the past three years--or it will never be expunged. Worse, it will once again visit itself on our children and grandchildren.

It is a fact of history that the true strength of a nation lies within the determination and resolve of its citizens.

We encourage you to reflect upon the society we desire for our children, one that is characterized by justice, equality, sustainability, and opportunity for all. It is a vision that can only be realized when we actively engage in the democratic processes that govern our land.

The power to effect change rests firmly in our hands.

Now is the time to demand transparency and accountability from our elected officials, to actively participate in public discourse, and to hold our governments to the highest standards.

We must remain vigilant, ensuring that our voices are heard and our concerns are addressed.

Let us not underestimate the influence we possess as engaged and informed citizens.

To create the society we all dream of, we must come together across all divides—geographical, social, and ideological.
We must embrace dialogue, respect diverse perspectives, and find common ground in our shared aspirations.

By fostering unity and understanding, we can overcome the challenges that lie before us and build a brighter future.

We must reject and turn away from the hateful ideologies and propaganda that was used to terrorize and control us. They did control us—neighbour against neighbour, parent against children, brother against brother, us versus them.

However, our responsibility extends beyond governance alone. We must also take a critical look at our individual actions and how we empowered the government to achieve these horrors.

Let us strive to be responsible stewards of our country, vigilantly protecting democratic practices that preserve our God-given rights and freedoms. Let us foster compassion, empathy, and inclusivity, creating a society that celebrates diversity and supports the most vulnerable among us, and protects the rights and freedoms of everyone.

Let the words *Never Again* be heard on every lip.

In the face of adversity, it is our duty as citizens to remain hopeful, resilient, and committed to the principles that define us as Canadians. We have a rich history of progress and innovation, and we can draw upon this legacy to shape a future that reflects our values and aspirations.

Together, let us embrace the responsibility that comes with citizenship. Let us engage in meaningful dialogue, hold our government accountable, and actively participate in the democratic process. Let us be the change we wish to see in our society.

With determination and unity, we can create a Canada that we are truly proud to pass on to our children, a nation that embodies justice, equality, sustainability, and boundless opportunities for all.

It cannot be business as usual. The crimes perpetrated on every single one of us must be addressed—and the perpetrators, at all levels, held to account.
10.2. Final Message of the Commissioners

We, the Commissioners of the National Citizens Inquiry, wish to express our heartfelt gratitude for the tremendous honour and privilege of serving on this distinguished Commission.

As this stage, as the Inquiry draws to a close, we reflect upon the incredible journey we have undertaken together and the significant impact our collective efforts have had on the pursuit of truth, justice, and accountability.

The Commissioners have had a firsthand opportunity to travel Canada from coast-to-coast and meet the some of the most extraordinary and courageous citizens of Canada. These witnesses, although aware of the potential consequences of their testimony, bravely stepped forward and set an example for the rest of Canadians.

Throughout this arduous but profoundly important process, we have had the opportunity to work alongside some of the most dedicated professionals, experts, and stakeholders. Their unwavering commitment to the ideals of transparency, fairness, and the pursuit of truth has been an inspiration to us all.

We are grateful for their valuable contributions and for enriching our understanding of the complex issues at hand.

We extend our deepest appreciation to the individuals and organizations who courageously came forward to share their experiences, expertise, and perspectives. Their willingness to engage with the Inquiry has been vital in uncovering the facts, shedding light on critical matters, and shaping the recommendations that will guide positive change.

We also express our gratitude to the wider public for their unwavering support and unwavering confidence in our work. Their expectations, concerns, and aspirations have served as a constant reminder of the significance of our task and the responsibility entrusted to us.

We have endeavoured to honour this trust by conducting a thorough, impartial, and diligent Inquiry.

The collaborative spirit and professionalism exhibited by the Commission members, staff, and all those involved in the Inquiry have been exemplary. Their dedication, expertise, and tireless efforts have been instrumental in our collective pursuit of truth, fairness, and the betterment of our society.

As the Commissioners conclude our mandate, we are acutely aware of the impact our findings and recommendations may have on individuals, communities, and institutions.

We commit to ensuring that our Report reflects the highest standards of integrity, accuracy, and fairness, as we strive to provide a comprehensive account and actionable recommendations that address the core issues at hand.
Finally, we express our profound disappointment to the governments, legislatures, and all those who have not stepped forward to support and facilitate the work of this Public Inquiry. Their abject disregard for accountability, transparency, and the pursuit of justice is an existential threat to a just and democratic society.

Once again, we extend our sincere gratitude to each and every member of this Commission whose dedication, expertise, and unwavering commitment to the pursuit of truth have made this journey possible. It has been an honour and a privilege to serve alongside such exceptional individuals.

Thank you.

Kenneth R. Drysdale
Dr. Bernard Massie
Janice Kaikkonen
Heather DiGregorio
These transcripts serve to preserve the firsthand accounts, opinions, experiences, and perspectives of those directly impacted by or involved in the issues under investigation.

11. Transcripts

11.1. Introduction

The inclusion of full transcripts of each of the witnesses as part of the official record is an essential component of the Commission’s work. These transcripts serve to preserve the firsthand accounts, opinions, experiences, and perspectives of those directly impacted by or involved in the issues under investigation.

**Process of Transcription:** The transcription process involved the detailed recording of all verbal testimony given by the witnesses during the hearings. A team of volunteer transcribers, utilized both manual (human) or automated (AI-based) methods, as well as multi-levels of manual reviews to ensure accuracy and efficiency. Every word is documented in the transcript, preserving the tone and context of the testimony.

**Quality Assurance:** Transcripts are carefully reviewed for accuracy. This may involve listening to the recorded testimony multiple times and correcting any errors. In some cases, unclear or disputed sections may be annotated within the transcript.

**Importance of Transcripts:** The transcripts serve multiple purposes. They provide a permanent, verifiable record of the hearings. This is important for ensuring the transparency and accountability of the Commission’s work. It also allows those who were not present at the hearings to access the information presented.

Furthermore, transcripts can serve as a valuable resource for future research, policy development, and historical record. They ensure that the experiences and voices of the witnesses are preserved for posterity, contributing to our collective understanding of the issues investigated by the commission.

In this way, the transcription process provides a meticulous, enduring account of the testimonies provided by the witnesses. It plays a vital role in preserving the evidence, upholding the integrity of the Commission’s proceedings, and informing future generations.
11.2. Opening Statements

We are proud to present full transcripts of the opening statements made at each of the eight hearings held across Canada as part of this Commission’s proceedings. While these statements are not direct testimonies from witnesses, they hold significant value and form an integral part of our understanding of the proceedings.

The opening statements set the tone for each hearing, encapsulating the mood, context, and undercurrents of the deliberations that followed. Delivered by key figures in the Commission, these remarks provide insights into the purpose, motivations, and aspirations of the Inquiry. They elucidate the themes that emerged in each hearing, illuminating the unique character and concerns of the various communities involved.

These transcripts offer an opportunity for readers to delve into the emotions, reflections, and aspirations that framed each of the eight hearings. They capture the intensity, hope, and commitment that defined the opening moments of each session. Each opening statement is a call to attention and a pledge of dedication to the truth-seeking mandate of the Commission.

The Commissioners have underscored the importance of these opening statements as part of the official record. Their inclusion reflects our commitment to preserving a complete and nuanced account of the proceedings. It is our hope that these transcripts will serve not only as a historical record but also as a source of insight and understanding for future generations as they reflect on this pivotal period in our national journey.

With the availability of these opening statement transcripts, we invite you to immerse yourself in the spirit and resolve that catalyzed each hearing, deepening your understanding of the proceedings and the invaluable contributions made by all involved.
11.3. Witness Testimony

We are honoured to present to you the complete transcripts of the testimonies provided by both lay and expert witnesses during the hearings of this Commission. These accounts form the heart of our proceedings, encapsulating a wealth of experience, knowledge, and insight that has been crucial to our understanding of the issues at hand.

Lay witnesses—those individuals who have lived through the events under investigation—provide personal, firsthand accounts that breathe life into our understanding of these experiences. Their testimonies paint a vivid picture of the human impact of these events, revealing the deeply personal and often poignant realities that lay behind the facts and figures. These accounts provide an invaluable perspective that helps us appreciate the complexity and the human dimension of the issues we are exploring.

Expert witnesses, on the other hand, provide a different yet equally valuable perspective. Drawn from various fields such as healthcare, education, law, and social sciences, these individuals offer insights grounded in extensive study, research, and professional experience. Their testimonies help us to understand the broader context, uncover underlying mechanisms, and explore potential solutions.

Both types of testimonies—lay and expert—are integral to our investigation. Together, they offer a nuanced and multifaceted understanding of the subjects at hand. The dialogue between personal experience and professional expertise deepens our appreciation of the complexity of the issues under review, informing our deliberations and guiding our recommendations.

The transcripts of these testimonies, painstakingly prepared by our dedicated volunteer transcription team, offer an accurate, detailed, and enduring record of these proceedings. They ensure that the voices heard during the hearings continue to resonate, informing and inspiring future discussions and decisions.

As you explore these transcripts, we invite you to reflect on the diverse perspectives, experiences, and insights they represent. These are the voices that have shaped our work, and we hope they will also shape your understanding of the important issues that have been brought before this Commission.
11.4. About the Transcripts

Our transcription volunteer team was a dedicated group of individuals who committed their time and expertise to support the essential work of this Commission. Their collective mission was to ensure the accurate and comprehensive documentation of each witness’s testimony, preserving their stories and contributing to a deeper understanding of the issues at hand.

This team was comprised of a diverse and skilled group, including both professional transcriptionists and individuals with strong listening and typing skills from various backgrounds. They were united by their shared dedication to accuracy, attention to detail, and respect for the content they handled.

Our volunteers understood the importance of their role in this process. They were committed to translating the spoken word into text with the utmost care, maintaining the tone and intent of the original statement, and ensuring that every voice was accurately represented.

Their work played a critical role in ensuring transparency, promoting accessibility, and preserving the historical record of these proceedings. Through their efforts, we maintained a thorough and lasting account of the testimonies presented to the Commission, contributing to our collective understanding and memory of these impactful events.

In recognition of their dedication and important contributions, we extend our deepest gratitude to our volunteer transcription team. Their unwavering commitment to this task reflected the spirit of service, civic engagement, and commitment to truth that was central to the work of our Commission.
ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI’s Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the “intelligent verbatim” transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at https://nationalcitizensinquiry.ca.

Ches Crosbie

Thank you, everybody, for your patience during this little bit of delay. We had some technical things to work out. As you can see, we've got a fairly big array of equipment here and talented people working it. Apparently, the Wi-Fi was not quite as muscular as we might have hoped. That was one problem. But I think we've got the bugs worked out of it. And the reason we have all this, of course, is we want to reach a bigger audience than the people in this room.

I've been walking around and chatting with some of you, and I get a real sense of excitement and anticipation from the folks I talked to, that they want a process that is going to bring the truth out. And that's what the NCI—the National Citizens Inquiry—and the commissioners are here to deliver to the people of Canada. And that's the truth.

So this is the first of nine hearings that are going to be held across the country: the first one being here in Truro, National Citizens Inquiry. And they're each three-day hearings, and I want to welcome the witnesses, on-site guests, all those following the proceedings from home. My name is Ches Crosbie. I'm a long-time lawyer in Newfoundland and Labrador, and I focused on medical malpractice and class actions. I have a King's Council designation, and I was Leader of the Opposition in the House of Assembly in Newfoundland and Labrador. That’s when I chose non-practicing status, so I’m not a practicing lawyer. This means I can’t give legal advice or act as a barrister and solicitor in the courts. My position under the rules of this Commission is Administrator.

The Commission is consensual, it makes its own rules, and has no legal powers based in statute. It's based on the desire of Canadians for the truth. Now I'd ask commissioners, in light of this truth-seeking mission, to just say a few words about who they are and why it is they've chosen to devote such substantial volunteer time to the mission of this Commission of truth-seeking. Perhaps we could start on this side, Ken.

Commissioner Drysdale

Hi, I'm Ken Drysdale. I'm a professional engineer with 41 years of experience. I spent a lot of that time preparing forensic engineering reports for various technical issues, and so
that's kind of the background that I bring to this. On a more human side, I have six children, four grandchildren, two godchildren, and that's the reason I'm here.

**Commissioner Kaikkonen**

Good morning. My name is Janice Kaikkonen. I am here for all sorts of reasons like you. I really believe that the truth must prevail in all our discussions. I'm hoping for open discussion and debate to come back into this country and that our freedom of expression, or constitutional rights and freedoms, are honored once again as the bedrock of our foundation. I have seven children and seventeen grandchildren. I often have to think about how many there are. I work with vulnerable populations, the people who are most at risk, in my day-to-day. I'm an academic and I'm also a researcher. And most recently I was elected as a school board trustee in Ontario.

I live on a farm. I raise turkeys as well. So, I kind of have all the bases covered. And I'm here to hear you. I'm so thankful that there's so many of you who are willing to step up and to speak. I think it's very important. And we will do you justice and we're going to listen. Thank you.

**Commissioner DiGregorio**

Hi, my name is Heather DiGregorio. I am a lawyer from Calgary, Alberta. I've been practicing at a regional firm in Alberta for close to 20 years. My area of law has been tax, so a little bit different from what we're talking about here. I've appeared at all levels of court for tax:

[00:05:00]

the Tax Court of Canada, the Federal Court of Appeal, most recently at the Supreme Court of Canada.

But why I'm really here is, my wish is that we have an honest and open inquiry here with a group of people who are all committed to be open-minded and to hear from Canadians and really get to the bottom of what it is that we did as a country in our pandemic response, and what effect did it have on us. And we want to determine, was there anything we did that worked? What can we do different next time? And we're here to listen, we're here to learn, and we're going to come up with recommendations on how to deal with the next one that comes along. And that's why I'm here.

**Commissioner Massie**

[In French] Hello everyone. Hello everyone, I'm Bernard Massie. I'm a consultant in biotechnology. I retired as a scientist at the National Research Council, where I worked for 35 years in biotechnology with expertise in therapeutic antibody development and adenoviral-based vaccines. [In English] I'm going to translate that immediately. My name is Bernard Massie. I'm a retired independent consultant in biotechnology. I've been working at the NRC for 35 years, in the area—to simplify—of therapeutic antibody development and adenoviral-based vaccines.

So I'm bringing to the table, I would say, scientific expertise in therapeutic antibody development. And, as with the other members of the Commission, on a human level I was really—I would say—amiss with all the stories I was hearing from the scientific community and medical community, which to me didn't jive with my understanding of the science. And
I wanted to go to the bottom of it. So that's why I thought I could join the Inquiry and listen to people that can actually bring their perspective on what happened during this crisis of the pandemic.

I have five children, two grandchildren, and I'm really concerned world we're trying to build for them. And I'd like to see something different for the future. And I'm hoping that, with this inquiry, we're going to let truth emerge and we're going to try to find ways to do better next time.

Ches Crosbie

Thank you kindly, Commissioners. There's a fifth Commissioner, Christian Grebe, who has a very distinguished track record. She has a PhD in history. She knows a lot about war crimes and crimes against human rights. She's a practicing lawyer in Alberta, and she'll be able to say a bit more about herself when she appears at the next hearing.

Our rules provide for commissioners, in case of necessity, to not attend. But they have to either be present virtually, so that they can be taking in the evidence as it comes out, or they can review it later. It gives us that bit of extra flexibility.

Now, given the time thing that's gone on here, as much as I might like my own opening remarks, I'm going to suspend them for right now. I think we'll go straight into the evidence. I might get a chance to make these remarks anticipating the evidence that the commissioners should expect to hear sometime later in the proceedings.

Right now, I guess we should really go to our first witness. Are we okay with that? Are we ready to go?

Okay, let's go!

[00:09:27]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

EVIDENCE

Witness 2: Dr. Peter McCullough
Full Day 1 Timestamp: 01:36:15–02:03:01
Source URL: https://rumble.com/v2ddo8a-nci-truro-day-1.html

[00:00:00]

Nicolle Snow
Good morning, everyone. Can you hear me okay? My name is Nicolle Snow, and I’m an injury and insurance lawyer with McIlvery Law. And I am honored and very happy to be a part of this process. Thank you for being here. We’re just waiting for the witness, who’s virtual.

Nicolle Snow
Good morning, Dr. McCullough.

Dr. Peter McCullough
Good morning. Can you hear me?

Nicolle Snow
Not well, so we’re going to work with that. We’ll keep going here, Dr. McCullough, so they can sort out the sound. I can hear you; it’s just not projecting that well.

My name is Nicole.

Dr. Peter McCullough
I have until the top of the hour.

Nicolle Snow
Okay, yes, no problem at all, and I do apologize for being late. We’re running a little bit late. We had some technical issues. So we’re going to move through, and I’ll have you out here by the top of the hour. Thank you for being here. We’re going to put you under oath.
Dr. Peter McCullough

Within a few months of the onset of the pandemic, myself and researchers had already synthesized and then quickly published the first peer-reviewed paper describing the treatment of SARS-CoV-2 infection at home to reduce the risk of hospitalization and death. I disagree that SARS-CoV-2 infection was one that was early on well-characterized. It was highly transmissible from symptomatic person to susceptible person. It had an overall case fatality rate far less than 1 per cent available to risk stratification. So, the elderly, those with multiple risk factors, at risk for death. And we knew early on that the virus was amenable to antivirals and, more importantly, use of drugs to reduce inflammation and thrombosis.
And that was ultimately well-supported over the next few months with multiple comparative studies.

**Nicolle Snow**

Thank you. What do we know about the virulence of the virus now, Dr. McCullough?

**Dr. Peter McCullough**

It’s greatly reduced with the continued progression of mutations to the Omicron and the sub-variants.

**Nicolle Snow**

Dr. McCullough, Canadians were advised that until a vaccine was created, the only available interventions were non-pharmaceutical measures to reduce transmission in the population—such as frequency of contact reduction, such as isolation, as well as probability of transmission-reducing measures such as social distancing, hand-washing, mask-wearing and so forth.

Can you comment on the assertion,

[00:05:00]

that these were the only available measures prior to the vaccine rollout?

**Dr. Peter McCullough**

Yeah, I disagree with that. Before the vaccine rollout, we had dozens of very viewed manuscripts: comparative studies that sequence multidrug therapy for the acutely ill worked to reduce the risk of hospitalization and death. And just shortly after 2021, we had a breakthrough paper showing that virucidal nasal sprays and gargles markedly reduced PCR positivity and reduce the risk for hospitalization. And there were no published studies at any time showing that public masking, social distancing, hand sanitizers or locking down those people without the illness had any impact on the pandemic.

**Nicolle Snow**

And Dr. McCullough, is there any real scientific logic to social distancing and masking and lockdowns in the context of this virus?

**Dr. Peter McCullough**

Not among well people, so there were no data suggesting that somebody perfectly well could transmit the disease and make somebody symptomatic who was adjacent to them. So the only thing that clinically was practical is somebody acutely ill with a characteristic signs and symptoms to keep distance from others. So the only people who needed to go into quarantine were those acutely ill with SARS-CoV-2, not the universe of people without the illness.
Nicolle Snow
Dr. McCullough, I know that you and a group of doctors had did some early research on the COVID in the early stages, treatment of COVID in the early stages. You touched on that a bit earlier. Can you speak about your findings in a bit more detail and how those findings were received once published?

Dr. Peter McCullough
The very first paper published on sequence multidrug therapy for COVID-19 in the American Journal of Medicine, August 7, 2020—myself as the first author—was widely applauded. It's still the most frequently read paper from the American Journal of Medicine over the last three years. It's listed as a top paper of interest. It received multiple letters to the editor as interest with replies, and it became the base standard of the Association of American Physician and Surgeons Home Treatment Guide in October of 2020.

So it was a breakthrough piece of information, a breakthrough paper. And it was followed up in December of 2020 in an updated protocol, which included now more drugs available to use, in Reviews in Cardiovascular Medicine in December of 2020.

Nicolle Snow
Thank you. I want to turn your attention now to the COVID injection. It is sometimes, well it’s most often called a vaccine; it’s sometimes called gene therapy. Are you able to speak to just what the injection is and how it operates?

Dr. Peter McCullough
In the United States, 92 per cent of those who've received a COVID vaccine—I'll just use the word "vaccine"—have received messenger RNA vaccines. And the messenger RNA vaccines, in my interpretation, are synthetic genetic materials: a genetic code with a three prime and five prime synthetic nucleoside analog caps, which make the messenger RNA essentially indestructible. They are loaded on lipid nanoparticles to provide distribution throughout the body, including the brain, the heart, the adrenal glands, reproductive organs—all the critical organs in the body. Messenger RNA has been demonstrated to be circulatory in the bloodstream for at least 28 days. We know that it codes for the spike protein of SARS-CoV-2. The spike protein was engineered by the University of North Carolina Chapel Hill and published by Manchurian colleagues in 2015. This work was done in the Wuhan Institute of Virology, Biosecurity Annex Level 4.

This messenger RNA that people have received codes for is the lethal part of the virus. And then once the messenger RNA is in the body, there is an uncontrolled production of the spike protein in terms of quantity and duration. The spike protein is proven in over 1,000 peer-reviewed papers to cause damage to the brain, the heart, the blood vessels; to cause blood clotting; and to cause immunologic problems in the bone marrow.

Nicolle Snow
Thank you, Dr. McCullough. It sounds like, then, that the COVID injection doesn't operate like a true vaccine. Is that correct?
**Dr. Peter McCullough**

The messenger RNA vaccines harnessed the body's own genetic material to produce the spike protein.

[00:10:00]

And the spike protein causes damage to the body, as I've described. Now, the aspiration I anticipate was that the spike protein would induce immunity. But we understood very quickly that there was no effective immunity from the vaccines. And so within 90 days of the release of the Pfizer vaccine in the Pfizer post-marketing data—which they kept as regulatory documents and were released under court order to the public—Pfizer had recorded dozens of fatalities due to COVID in people who were fully vaccinated with the product. And sadly, Pfizer recorded 1,223 deaths directly attributable to the vaccine.

**Nicolle Snow**

Dr. McCullough, are you able to speak on the research and development process for this product? In other words, did it follow established regulatory standards for vaccines?

**Dr. Peter McCullough**

In a paper by Lalani and colleagues in the *British Medical Journal* in the last month, the description of messenger RNA development is laid out in a timeline since 1985. So the United States has had a long-standing interest in the development of messenger RNA. And then in 2012, DARPA, the research division of the U.S. military, created a program called the ADEPT-P3 program. It's on their website even today stating that the military had a desire to use messenger RNA to end pandemics within 60 days. So the United States made an unprecedented government investment in messenger RNA. However, human studies were never performed until we had a condensed, rushed production of the vaccines for COVID-19 in Operation Warp Speed.

So, it had a very long development cycle. There were many issues to tackle, and then it was in a condensed set of prospective randomized trials to gain emergency use-authorized approval.

**Nicolle Snow**

Did safety and efficacy have to be proven in the production of the product?

**Dr. Peter McCullough**

Safety and efficacy always have to be proven. With genetic products, the safety by regulatory standards takes a five-year timeline. So the safety study should have been started way in advance, since the United States been working on this since 1985 and they simply weren't done. Efficacy had to be proved for the outcome of hospitalization and death. And hospitalization and death were never a primary or secondary endpoint of any trial. And so there can be no claims that the vaccines reduced hospitalization and deaths, since they weren't assessed in these trials. Where recorded, there was no reduction in hospitalization and death. In fact, deaths were more frequent in those who took a vaccine. And in the United States, the consent form doesn't make the claim that the vaccines reduced hospitalization and death.
**Nicolle Snow**
I want to turn your attention to the vaccine event recording systems, Dr. McCullough. I know in the U.S. where you are, there’s the VAERS [Vaccine Adverse Event Reporting System]. In Canada, we have CAEFISS, that’s the Canadian Adverse Events Following Immunization Surveillance System. There’s the yellow card system in the U.K. and the European Safety Monitoring System. These systems have been in place for decades, as I understand it, at least in Canada. CAEFISS has been in place since 1987.

Can you speak about what, if any, unusual findings are showing up in these vaccine reporting systems following the rollout of the COVID injection?

**Dr. Peter McCullough**
In June 11, 2022, the World Council for Health summarized those safety data systems: 39 total, but four major ones, including VAERS, YellowCard, the EUGIS system, and the WHO VIGI-safe system. All of them have been recording record numbers of injuries, disabilities, and deaths.

For example, in the U.S. VAERS system, all vaccines combined and accumulating all injections before COVID, a child would receive greater than 70 injections over the course of childhood. Per American child—and we knew 98 percent of Americans were taking vaccines at this level—there was a total on average of 158 deaths per year in this entire data system, which is the best. With COVID-19 vaccines as we sit here today, as of March 3rd, 2023, for U.S. domestic cases only, VAERS has recorded 17,071 deaths that have occurred within a few days of taking the COVID-19 vaccines, and 16,454 permanently disabled Americans.

The VAERS reports are largely done by doctors, nurses,

[00:15:00]

and those caring for patients where they believe the vaccine is the cause of the injury or death.

**Nicolle Snow**
Dr. McCullough, is there an accepted percentage of adverse events that are considered medically tolerable, if you will, beyond which the product would be removed from the market for safety concerns?

**Dr. Peter McCullough**
I’ve chaired over two dozen data safety monitoring boards as the head of the board or a member, including those for the NIH [National Institutes of Health], BARDA [Biomedical Advanced Research and Development Authority], the Military Research Division of the NIH, as well as pharmaceutical companies—in vitro diagnostic companies. It’s my testimony that five, 10, 15, no more than 50 deaths—even for the largest program—would ever be tolerable. That programs would be shut down. And then a deep dive on safety to figure out why people are dying after taking an injection.

It’s my testimony that, knowing what we know— The rollout of Pfizer in the United States was started December 10th, 2020. Pfizer should have been pulled off the market before the end of January of 2021, with fewer than 27 million Americans being injected. Moderna
probably should never have rolled out. And if it rolled out, it would have been pulled off the market shortly afterwards. Janssen, again, should have never had market entry because Pfizer and the entire product line would be off the market because there would be an understanding that the spike protein being produced is lethal to the human body.

Nicolle Snow
Dr. McCullough, you spoke a little bit on adverse events already, but would you speak in a little more detail on the cardiovascular events that are medically known to be connected to these COVID vaccines?

Dr. Peter McCullough
There are over 200 peer-reviewed papers published on cardiovascular syndromes directly attributed to COVID-19 vaccination and agreed to by regulatory authorities. One of them is myocarditis or heart inflammation. Two studies have indicated that 2.5 per cent of people who take a vaccine suffer heart damage. About half of them, it’s symptomatic. Half of them, it’s not: the peak age is 18 to 24 years, 90 percent are men, 10 per cent women. It’s a skewed distribution with a tail up into the 60s and 70s.

There have been fatal cases, autopsy-proven, by Verma, Choi, Patone, and Gill. It is conclusive that in a fraction of those who have received the COVID-19 vaccine, heart inflammation or myocarditis is fatal; and the mechanism of death is sudden cardiac death, a sudden arrhythmic death, a young person collapsing and not being resuscitated by CPR.

This is now well described here in the peer-reviewed literature. An important paper by Yonker and colleagues in circulation from Harvard has shown, in young boys and girls hospitalized at Massachusetts General Hospital with myocarditis, about 90 per cent acutely are hospitalized to recognize the symptoms. Those who are having myocarditis have unopposed spike proteins circulating in the body damaging the heart. Those not affected with myocarditis actually have appropriate antibodies neutralizing the spike proteins. What I conclude is that, unfortunately, a small number of people do produce spike protein that is not effectively neutralized by the antibodies and so they have unevaded heart damage.

Myocarditis is lethal and, of course, a single death in a young person is unacceptable, because young people are not at risk for hospitalization and death with the virus. The COVID-19 vaccines should have always been contraindicated for young people not at risk for the illness. In addition to that, the vaccines cause a progression of atherosclerotic cardiovascular disease. They precipitate coronary atherosclerotic plaque rupture in traditional plaque, cardio infarction. The vaccines are proven to cause blood clots, both in arteries and in veins. The U.S. FDA [Food and Drug Administration] has published on this. In a paper, Wu and colleagues have demonstrated thousands of Americans developing blood clots after COVID-19 vaccines, where the FDA agrees that vaccines cause the blood clots, describing them going from the ankle to the hip. So, very large blood clots in the venous system: in the Wu paper, 11 per cent are fatal.

Additionally, the COVID-19 vaccines have been associated with a whole variety of other cardiovascular manifestations, including vasculitis, a problem of inflammation in the blood vessels in the kidneys. In a paper in the Journal of the American Society of Nephrology, Wu
and colleagues describe the progression of the vasculitic and nephritic kidney disease in those, worsening their chances of survival free of dialysis.

In summary, the COVID-19 vaccines, by the mechanism of myocarditis progression of cardiovascular disease and blood clots, are believed to be the cause of unknown death in any individual where the vaccine is known to be taken by that person.

Nicolle Snow
Thank you. Dr. McCullough, the Canadian government has maintained that the COVID vaccines are both safe and effective, and continues to encourage Canadians to take them, including children: to vaccinate and to booster.

Given what you have had to say about COVID-19, its virulence, the vaccine, and the statistics on adverse events, what is your opinion on whether the vaccine is both safe and effective?

Dr. Peter McCullough
The decision on safe and effective is made by senior care doctors with medical authority. I would have—and I do have—medical authority over government officials in Canada. It’s my testimony today that the vaccines are neither safe nor effective. And that opinion has superiority and supersedes any government statement.

Nicolle Snow
Thank you, Dr. McCullough.

My last question is really just about corrective measures. A lot of people the world over have taken the injections. What, if anything, can they do to mitigate the damage they have incurred in their bodies?

Dr. Peter McCullough
Two points. One is the toxicity and the risk of death appear to be cumulative. So the first point is to take no more injections because the next one could be fatal or disabling. Second point is to be vigilant. Blood clots, heart damage, neurologic damage, intracranial hemorrhage stroke: all these need to be clinically recognized and treated the best they can conventionally.

None of the governments have started large research programs into vaccine injuries, disabilities, and death, and that research is greatly needed. Very similar to the tobacco settlement and the final recognition that tobacco causes disease in the U.S. tobacco settlement: much of the money received by the tobacco industry had to be turned around into research for doctors to learn how to treat patients. We’ll need a similar type of program with COVID-19 vaccine injuries.

A paper by Zogby and colleagues, a representative survey in the United States, showed that 15 per cent of those who’ve taken a vaccine have some new medical illness—some new disease that we’re dealing with. I’ve covered just the tip of the iceberg in terms of the cardiovascular complications, but they also span the fields of neuropsychiatric problems, autoimmune problems, and so there’s a great medical need to care for those individuals. And I would just say there’s also an acute medical need, even though very few people now are taking COVID-19 vaccines. This CDC V-safe data, which was released under court order,
reveals 7 per cent to 8 per cent of people who take a vaccine have to acutely go to the hospital and be hospitalized in the emergency room or urgent care center. So there’s a great need to still manage the acute problems that develop within a few hours of taking it in a shot.

Nicolle Snow
Thank you, Dr. McCullough. I thank you sincerely for giving evidence here at this Inquiry today.

Don’t go away just yet. I’m leaving a few minutes here in case any of the commissioners would have questions for you. Thank you very much.

Commissioner Massie
I have some expertise in biotechnology and vaccine, so I’ve been following everything you’ve published and said on many conferences. One other thing that really puzzles me is: What’s happening with all the evidence that has been pouring in for more than two years?

[00:25:00]
What’s happening that the medical establishment and all the health institutions are still promoting that kind of intervention?

Dr. Peter McCullough
In the United States, the medical establishment, I think, has been greatly influenced by the COVID Community Corps program. The COVID Community Corps program announced early in 2021 that over $13 billion was sent out by the White House and the Department of Health and Human Services to a variety of health institutions, thousands of media outlets, Hollywood pro sports teams—all to promote the vaccines. We know separately that Pfizer and Moderna contracted a public relations firm called Weber Shandwick. And Weber Shandwick initiated a corporate program called Plan VX. Plan VX promoted vaccine mandates within large companies.

Then lastly, Weber Shandwick had an installed marketing unit within the CDC vaccine office. This has all been uncovered by Senator Rand Paul in October of 2022 and is publicly disclosed.

Commissioner Massie
Thank you.

Nicolle Snow
Okay, those are all the questions. Thank you so much, Dr. McCullough, for appearing here today.

[00:26:46]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS                  Day 1

March 16, 2023

EVIDENCE

[00:00:00]

Nicolle Snow
Okay, everybody, thanks for taking your seats. We have our next witness up, who is Dr. Patrick Phillips out of Ontario. I’ll let you bring him up on the screen there.

Hi, Dr. Phillips, how are you?

Dr. Patrick Phillips
Good, how are you?

Nicolle Snow
I’m well, thank you. Before we get started here, we’re going to affirm you. I’m going to let that happen now.

Ches Crosbie
Dr. Phillips, you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Dr. Patrick Phillips
I do.

Ches Crosbie
Thank you.

Nicolle Snow
Good morning, Dr. Phillips, you’re joining us from Ontario?
Dr. Patrick Phillips
I am joining you from Ontario.

Nicolle Snow
Thank you for being here to give testimony in this proceeding, Dr. Phillips, can you start by going over your medical credentials?

Dr. Patrick Phillips
Yes, I graduated from Dalhousie Medical School in New Brunswick in 2016. After that, I did go to the University of Toronto, where I completed my two-year family medicine residency. And after that, I entered into practice.

Nicolle Snow
All right, and can you give a little summary of where you were practising?

Dr. Patrick Phillips
Sure, yeah. Like many new graduates, I primarily worked locums, which is basically filling in temporarily at various locations. As well, I had a weekly addictions medicine practice where I saw patients once a week in downtown Toronto, giving methadone and suboxone. But as time went on over the last few years, I did kind of narrow down the places where I was working, doing emergency and medicine, to Nipigon and Englehart. And then eventually I moved full-time to Englehart at the beginning of 2021.

Nicolle Snow
Okay. And your locums were in the area of family medicine and emergency medicine?

Dr. Patrick Phillips
Yes.

Nicolle Snow
Okay. And your practice in Nipigon was in the area of Emergency Department work or family?

Dr. Patrick Phillips
Both. So comprehensive family medicine, which is in-patients, office-based family medicine and emergency.

Nicolle Snow
Thank you. And Dr. Phillips can you confirm that you sent me a copy of your CV?

Dr. Patrick Phillips
I did.
Nicolle Snow
All right, and the CV for the record is exhibit number TR-0001.

Are you currently practising, Dr. Phillips?

Dr. Patrick Phillips
No, I’m not. My medical licence has been suspended by the CPSO [College of Physicians and Surgeons of Ontario] since May 3rd, 2022.

Nicolle Snow
Okay, and why was your medical licence suspended?

Dr. Patrick Phillips
So, it was suspended primarily for holding a medical opinion that is contrary to the public health directives and some of the consequences of that. We’ll get into some of those details later, but that’s essentially it.

Nicolle Snow
Okay, thank you. We’ll talk about that in a little bit. When was the suspension effective?

Dr. Patrick Phillips
May 3rd, 2022.

Nicolle Snow
Dr. Phillips, did you take the Hippocratic Oath and what is that?

Dr. Patrick Phillips
I did take the Hippocratic Oath as part of our ceremony at Dalhousie Medicine. It’s an oath, basically, that the medical profession has taken, or some other oaths that are also taken across the world, in order to uphold medical ethics. And to put the patient and our oath to the patient first, above any other authority, so that the patient’s interests are always the number one priority of doctors in that doctor-patient relationship.

Nicolle Snow
And I’m sure you took that oath seriously.

Do you know what the Declaration of Geneva is, Dr. Phillips?

Dr. Patrick Phillips
During the course of World War II—both in Germany and Japan, and many other places—there were atrocities committed by these regimes that were primarily carried out by doctors, physicians. Physicians who were actually captured by a public health ethos of believing they’re doing what’s best for the race: for the Aryan race as an example in Germany, or just following government directives or following orders. And so, after the
As a way to prevent those atrocities from happening again. So that doctors will not just follow orders blindly but will put the rights of their patient first.

And if I can quote, I won’t do the whole thing but a few of these are very relevant. Most have the medical schools in the U.S. make the oath of the Declaration of Geneva and most of them in Europe. I’ll just pull a couple out of it here: “I solemnly pledge to dedicate my life to the service of humanity. I will respect the autonomy and dignity of my patients. I will maintain the utmost respect for human life.” And most pertinent I think here is: “I will not use my medical knowledge to violate human rights and civil liberties, even under threat.”

So that was—Canada was a signatory to this.

Nicolle Snow
Thank you. And it sounds like those passages in particular resonated with you, Dr. Phillips, did they?

Dr. Patrick Phillips
Absolutely.

Nicolle Snow
Dr. Phillips, on April 30, 2021, the College of Physicians and Surgeons of Ontario issued a statement forbidding physicians from questioning or debating the official COVID-19 response measures in Ontario.

What do you know about this, and can you give a little more detail on that?

Dr. Patrick Phillips
Yeah. Although the College was quietly coming after doctors for having an opinion that goes contrary to the government narrative before this, amazingly, the College came out and very explicitly forbade doctors from carrying out our oath and scientific method for patients.

So, what they state in their message, that they just sent out as a tweet; it wasn’t a policy, it wasn’t a regulation. But they put this out saying that, “Physicians hold a unique position of trust within the public and have a professional responsibility to not communicate anti-vaccine, anti-masking, anti-distancing, and anti-lockdown statements, and/or promoting unsupported, unproven treatments for COVID-19. They go on to say, “physicians who put the public at risk may face an investigation by the CPSO and disciplinary action when warranted.”

This was shocking to me and many others. As a result, I gathered together with a group of physicians, and we together created Canadian Physicians for Science and Truth. And made the declaration asking and demanding for the CPSO to rescind their statement. And in that declaration, which has thousands of signatories of the public, and there’s over 700 signatories in the physician category. Well, not all those have been vetted, but there’s
definitely hundreds in there. Basically, saying that this statement—to follow this, would be a violation of three things. So, one is the scientific method, which requires the advancement of medicine, requires that we have to challenge the status quo. We have to be able to speak freely again, to debate things. And that requires us to be able to be wrong, right? Because otherwise you can never challenge things.

The other one is our obligation to give evidence-based medicine to our patients. And that means discussing the evidence. If the evidence says people are dying from this vaccine, that people are suffering severe adverse events, or that it’s not effective, those could be considered as anti-vaccine views. But they’re true. And so, we have an obligation as physicians, no matter what the College says, to give the truth to our patients as we see it.

The third one is our duty of informed consent. In order for us to administer a vaccine to somebody, they have the right to be informed of all of these things. About the fact that we don’t have any long-term data. About the fact that patients have died from these vaccines and many others, including for lockdowns, for masking, and others. Without that, if doctors are muzzled, patients don’t get informed consent. And that is their right. So we basically demanded from the CPSO to rescind this statement, which they did not do.

Nicolle Snow
Okay. And you mentioned this group of physicians that got together and created this declaration: do you happen to know the website?

Dr. Patrick Phillips
Yes, CanadianPhysicians.org, where you can see our declaration in its entirety, and the signatories to it.

Nicolle Snow
Thank you.

Dr. Patrick Phillips
In the beginning of 2020, I was working between two sites. I was living in downtown Toronto, but working primarily in northern Ontario, flying in and flying out to Nipigon and Englehart.

Nicolle Snow
Okay. And your practice was in a hospital setting?

Dr. Patrick Phillips
Hospital and an office space as well.
Nicolle Snow
What measures were taken in your region with respect to the COVID crisis? In the hospitals you’re working in and, et cetera.

Dr. Patrick Phillips
There were a number, and they were changing all the time. But some of the most striking ones were the switch from in-person medical care to phone-based care in the medical community. That was throughout all of Ontario. Patients could not see their doctor unless in very rare circumstances. So almost all medicine was done just by phone, where doctors were asking patients to do their own physical examination, which they’re not trained to do. And basically, doing guesswork, which was quite concerning.

Nicolle Snow
Did that pose any other concerns for you?

Dr. Patrick Phillips
Definitely. In the beginning, I was watching a lot of what the media was showing on Italy and New York. And so, I was concerned that there was an extremely deathly virus coming around at that time. I don’t believe that now. But at that time, I thought maybe this is worth it. Maybe there’s something we need to do, because if everybody comes into the office and catches COVID—the deadly form of COVID that I thought was coming—then I thought it could be worth it.

But yeah, that was kind of my main concern until later on, when I started to see the real consequences of this shift. And that’s when I began to speak out.

Nicolle Snow
Okay, and what kind of consequences were you seeing in your practice?

Dr. Patrick Phillips
I was seeing a few things. One is devastation to both the physical health and the mental health of patients. To give you one example, there was one patient who I saw in emerge. Over the last year, she was treated for back pain over the phone—severe back pain to the point that she was on opioids. And she only came to see me in emerge. by the time her pain was so bad she had to call an ambulance. And when I saw her and physically examined her, what she called back pain was actually a giant tumor. It was actually a liver riddled with cancer.

That was not the only example of this, of late-presenting cancer of patients who were treated over the phone. If they were able to see their doctor in person, that could have been caught much earlier and possibly treated. But by the time I saw her, it was metastatic. I saw a number of patients like that.

The other thing I saw that really concerned me was the mental health of patients. And while I did see an uptick in overdoses in suicidality and depression in emerge. in adults, what was most striking was the children. I’d never seen so many suicidal children—as young as eight, right? And it’s very rare for that to happen. But I noticed a common thread, and that was children—During the height of lockdown, when schools were closed, parents
In my opinion, it was a very disturbing story. It was a middle-aged, like 50s, 60s, woman.

Dr. Patrick Phillips
And can you offer any details about that?

Very few but yes, I did. We had a few in our community. The COVID wave came later, mostly after I was no longer working in the hospital. But while we did have a few; I did treat one while I was working in the hospital in Kirkland Lake.

Nicolle Snow
And can you offer any details about that?

Dr. Patrick Phillips
In my opinion, it was a very disturbing story. It was a middle-aged, like 50s, 60s, woman who came in, diagnosed with COVID. And she was short of breath, and she needed oxygen.
At that time, there was so much evidence. There was study upon study: I think there were 30 to 40, when you bring those together, showing that ivermectin would reduce mortality by 50 to 70 per cent. We have very few drugs that can do that.

When she came in and she was under my care—at that point, I was working as a hospitalist on the floor in Kirkland Lake, which is the sister hospital to mine in Englehart. I felt a duty to give her informed consent and to prescribe to her ivermectin for the treatment of her COVID, because she had a number of risk factors for severe disease or death.

When I wrote that, the pharmacist reported me to the chief of staff. The chief of staff then ordered me to cancel the order for ivermectin, including the zinc and vitamin D and other harmless vitamins that I also prescribed to her, which we know can be helpful. And he ordered me to call the local ICU in Sudbury—well, the distant ICU in Sudbury—and get their permission to prescribe outside the guidelines, which requires remdesivir, which is very harmful, and others, such as steroids. And they basically only allowed me to prescribe the steroids, so I gave her steroids. But I was shocked that this chief of staff ordered me to cancel lifesaving treatment to this patient that peer-reviewed research shows reduces mortality.

Nicolle Snow
Approximately when was that?

Dr. Patrick Phillips
This was in March 2021.

Nicolle Snow
Okay. And I think you said that was March 2021 that that occurred?

Dr. Patrick Phillips
Yes.

Nicolle Snow
Okay.

Have you had occasion to prescribe ivermectin again or was that the end of your prescriptions for ivermectin?

Dr. Patrick Phillips
I would have, but again, in my community, there was very little COVID and the ones that were there were very mild. They didn’t need to be hospitalized for the most part.

I did prescribe ivermectin again to a patient who had what I believe could have been a vaccine injury. She received a dose of the vaccine and after that, had nausea lasting for weeks—nausea, fatigue, muscle aches. So, I did prescribe according to the FLCCC [Front Line COVID-19 Critical Care Alliance] protocol, which was ivermectin, fluvoxamine and atorvastatin, which was successful. It did resolve her symptoms, but the pharmacist reported me to the College. And as result of that, the College did put a restriction on my
licence forbidding me from prescribing ivermectin, fluvoxamine or atorvastatin for COVID—among other things, such as vaccine exemptions and mask exemptions.

**Nicolle Snow**
Okay, and we’ll get into some of those details on the charges in a moment. I want to move into the post-vaccine period.

You’ve spoken about that a little bit.

**[00:20:00]**

You had a patient that had a vaccine injury. The rollout of the vaccines was in and around early 2021. What, if any, protocols were put in place at the hospital you were working in with respect to monitoring vaccine effects?

**Dr. Patrick Phillips**
So, I mean, our hospitals spoke nothing at all about monitoring vaccine effects, but we do have a legal obligation to report adverse events. Some of the more serious ones we’re obligated to and other ones we’re kind of permitted to.

**Nicolle Snow**
Is it a form that you complete, Dr. Phillips?

**Dr. Patrick Phillips**
Yeah, there’s a form. The CAEFISS [Canadian Adverse Event Following Immunization Surveillance System] basically is very local in the sense that there’s a form through Ontario Public Health that we fill out and send to our local public health officer. Who then is supposed to investigate and pass the investigation onto Public Health Ontario, and then they’re supposed to amalgamate the data and pass it on.

**Nicolle Snow**
Okay, and you mentioned CAEFISS. That’s the Canadian Adverse Event Following Immunization Surveillance System. It’s a bit of a mouthful.

The adverse event forms that that you were just speaking about: those were the forms that the doctors would fill out in the hospital if they thought something was a vaccine adverse event? And can you confirm that you gave me one of those blank forms?

**Dr. Patrick Phillips**
Yes.

**Nicolle Snow**
Yes. Okay, and that is marked as Exhibit TR-0001a. So TR-0001a is the exhibit, it’s the Adverse Event Following Immunization Reporting Form.
Dr. Phillips, as I understand the evidence that you just gave, you would not be forwarding that form to the CAEFFIS system. You would be forwarding it to a public health officer who would then determine whether it would be filed with CAEFFIS.

**Dr. Patrick Phillips**
Correct.

**Nicolle Snow**
Okay. Is vaccine aftermarket monitoring an expectation for physicians?

**Dr. Patrick Phillips**
It’s supposed to be, yes.

**Nicolle Snow**
And for what reason?

**Dr. Patrick Phillips**
Yeah, we’re actually obligated by law. For certain severe ones, we’re obligated to report these adverse events when we see them. And then outside of that there’s kind of more of a permissive requirement. I think it’s an ethical requirement to pass on all adverse events that happen after these, especially in the context of an emergency use authorization. So, something that’s not fully tested but yet was rolled out early. Even more, we have in my opinion an ethical obligation to report all possible adverse events, so that the CAEFFIS system will be able to detect possible harm and be able to withdraw the product if it’s warranted.

**Nicolle Snow**
Okay. And the purpose is to monitor the safety and the effectiveness of the product. Is that correct?

**Dr. Patrick Phillips**
Exactly.

**Nicolle Snow**
What kind of events were physicians required to take note of, according to the form—the adverse event form?

**Dr. Patrick Phillips**
It’s pretty broad on the form. I can’t recall all of them off the top of my head. I don’t have it in front of me.
Nicolle Snow
Yeah, it's okay. If you don't have it in front of you, it's marked as an exhibit in any event. Did you have any occasion to complete any of those adverse event forms?

Dr. Patrick Phillips
Yes.

Nicolle Snow
All right, can you elaborate on that?

Dr. Patrick Phillips
Yeah, I did. I did complete 10 adverse event reports that I sent in. I'll give you kind of the basic details of these reports really quickly here. All but one of them, as far as I know, were not submitted. So nine of them were rejected, as far as I know. The first one is a person with nausea for two weeks and vomiting, including hematemesis or bloody vomiting. This started four days after the second dose of Moderna.

The second one was a new onset severe vertigo and ringing ears, by diagnosis vestibular neuritis, that came up four weeks after his Moderna shot. The third one was sudden onset, in a young woman: sudden onset arm weakness for four hours. Weakness in the arm and complete decrease of sensation in an entire half of her body,

[00:25:00]

with persistent loss of sensation in fingers, lasting hours to days. In my opinion, it was stroke until determined otherwise, so I started the stroke protocol.

Nicolle Snow
How many days post-vaccination was she?

Dr. Patrick Phillips
Oh, sorry—this was nine days after her Moderna shot.

The fourth one was an elderly woman with severe delirium, a high fever, and left arm numbness four hours after her Moderna shot, lasting greater than 48 hours. That's the point I saw her.

The fifth one was a woman with dementia but was functional at home, able to talk and walk. But after her dose—I'm not sure which vaccine it was—she lost the ability; she slowly declined over the course of about two to three weeks and lost the ability to communicate and to walk as well.

The sixth one was an older woman who developed palpitations, so a heart issue, possible arrhythmia with severe hypertension, and that started one week after her Moderna shot.

The seventh one was a younger woman with persistent numbness to the right side of her forehead; she lost sensation there entirely. No other symptoms really, but that started two hours after her Pfizer shot and then persisted.
The eighth one was intermittent left arm weakness. His arm would become weak, he was dropping things and no longer able to work. That would happen three to five times a day. That started two days after his Pfizer shot. And two weeks later—so it was two days after and then persisted—then developed persistent daily headache, nausea, and vomiting. It could have been something going on in his brain or others. I don’t have the final diagnosis because, as an Emergency [Department], we don’t follow our patients, we pass them on to others; they’re investigated.

The ninth one was a middle-aged woman, who tragically—16 days after her Pfizer shot, with no other health history—had a devastating bleed into her brain after her blood pressure surged into the two hundreds. She lost the ability to talk and walk; she was found on the floor. She then was devastated.

The tenth one is, the only one that I know was actually accepted as an adverse event, and that was a severe rash on a woman’s arm that came on eight days after the vaccine. That was kind of a ring-like rash that spread up above her shoulder and down the arm.

Nicolle Snow
And so, as you as you’ve indicated, that tenth one where there was the rash on the arm, that was at the site of the vaccination, was it?

Dr. Patrick Phillips
Yep.

Nicolle Snow
That’s the only one that you know definitively was accepted.

What happened with the rest of them? Did anyone contact you?

Dr. Patrick Phillips
I was contacted by the public health officer; he sent me a letter after the first five. He told me that none of these five meet their criteria for an adverse event, so they’ve all been rejected and, “Take note of that because I’m doing my reports.” I send a note back to him by fax asking for the details of why each one of these were rejected. “Do you need more information?” I want to make sure that not just rejected for a clerical reason and I did not get a reply.

I was very concerned about this. I was concerned that the public was not getting informed the consent about these possible severe adverse events. Many of those may have been strokes. And so, in order for us to have a safe vaccine safety system, they need to be able to get these reports to be able to know if a product needs to be pulled off. So I did go public. I did an interview with Rebel News where I spoke about these adverse events. And the letter that I got sent saying they’re all getting rejected and as a result that public health officer complained to the CPSO. And they’re investigating me, and I’m charged for professional misconduct for those nine of the adverse events that were not accepted. They’re saying that I’m being incompetent for filing these adverse event reports and they’re saying I failed to meet the standard of practice in the profession.
Okay, stunning. All right, Dr. Phillips, let's talk a little bit about your personal life outside of your clinical practice. You've indicated that you were quite vocal about the concerns that you had that were going on inside your practice and in the hospital system. Can you speak a little bit about that?

[00:30:00]

Like my Twitter feed, you mean?

Okay, stunning. All right, Dr. Phillips, let's talk a little bit about your personal life outside of your clinical practice. You've indicated that you were quite vocal outside of the hospital system. And you also indicated that public health officer came after you when you were vocal, so maybe you could talk about that.

Yeah, so around that time—like I said, at the end of 2020—when I was seeing those harms from the lockdowns, and the medical association was saying, "doctors are calling for harsher lockdown," that was the moment that I made the decision that I need to speak out.

I got onto my Twitter account, and that's where I've done a lot of my speaking out about public health measures: about the science that public health isn't talking about, like vitamin D, exercise, things like that—other public health measures that are effective, and the ineffectiveness and harms of lockdown, of masking, and of these vaccines.

I spoke out on Twitter, and I've done a number of alternative media interviews, and I even did a press conference with [inaudible] on Parliament Hill in June. And for all of these, the College opened up a section 75 investigation here in Ontario. And they have charged me with professional misconduct and incompetence for my communications, saying, again, that statement from before: that we're forbidden from saying anything that goes contrary to other public measures, and therefore they've charged me with professional misconduct for all of it.

Okay, and is that what led to the eventual licence suspension?

Yes, all of these things combined. Yeah, they opened up a number of investigations that kind of all piled on top of each other. Essentially, the charges are on my public speaking contrary to public health measures. They're charging me with professional misconduct for providing prescriptions for ivermectin, for vitamin D, for zinc, and vitamin C. They have charged me with professional misconduct for providing vaccine exemptions to patients, for either medical conditions or for being coerced, as somebody promoting their autonomy. They've charged me with professional misconduct. I think that's the majority of it.

There's a lot of side charges as well. Yeah, as well as reporting all these adverse events. I have those nine charges of professional misconduct for each of my adverse event reports.
**Nicolle Snow**

All right. I think you indicated some of this was also related to you writing exemptions and so forth. And was that in the context of a family practice?

**Dr. Patrick Phillips**

Yeah, so some of them I did privately. And some of them I did in the Emergency Department. I had people coming to me. After they saw me speaking publicly, they would come into the Emergency Department and ask for letters of support or for notes and I gave that to them—either if they had a medical condition or sometimes for patients who were being forced against their will and they were under duress and couldn't give their consent. And so, I gave letters of support in those cases.

**Nicolle Snow**

Okay. It sounds as though, Dr. Phillips, that when you spoke out about your views with respect to your concerns with the protocols and so forth, were you somewhat under the microscope after that point?

**Dr. Patrick Phillips**

Oh, absolutely. Any interview that I gave on media, every Tweet that I've ever made, anything that I've ever said, they have recorded and gotten transcripts of to prosecute me. One funny story about this: I spoke in Toronto at the World Freedom Rally, I think it was in January. And there was a whole crowd of people at the rally: none of them wearing masks at all, right? Because it's a freedom rally. There's two people that are coming in with masks with a microphone and a recorder, and they kind of came right up to me. There's only two people in the whole place wearing masks. I later found out in my disclosure that that was the College actually coming to record my speech. And I have the transcript of it from those two people at the rally.

Yeah, I was definitely under the microscope!

**Nicolle Snow**

Okay.

[00:35:00]

Is it fair to say that your actions throughout the pandemic and your willingness to speak out is directly connected to your desire to protect your pledge to your patients?

**Dr. Patrick Phillips**

Absolutely. What I'm most concerned about— And as a physician, the way I've always practised medicine, is that we're there as an advisor. We're there to share our medical knowledge to help patients make choices with their own health care. And I was so concerned about this change in ethics in the medical community, where coercion is normalized, and where doctors participate in coercion in forcing patients into things. I found it abhorrent. And that was what mostly led me to want to speak out: to protect the rights of patients for their wants, their desires, their freedoms to be at the center of the medical system and the doctor patient relationship. Yes.
Nicolle Snow
Thank you so much for offering your testimony here today, Dr. Phillips. There may be questions from the commissioners, so I'm going to ask you to hold on there. Hold on one moment, there may be questions.

Commissioner DiGregorio
Thank you, Dr. Phillips. I just have a few questions following up on some of the things that you've spoken about today. Early in your testimony, you talked about there being a college statement that was issued forbidding doctors from communicating anti-vaxx, anti-mask, anti-lockdown type positions. Is that something that we have in our evidence as an exhibit? And if not, is that something that we would be able to take a look at?

Dr. Patrick Phillips
Oh, yeah, definitely. It's still on their Twitter feed. It's on their website. They have not taken it down. Yeah, I can send it on to you.

Commissioner DiGregorio
Thank you.

Another thing you mentioned was some of the early measures that were taken early in the pandemic and the switch from in-person visits with doctors to phone-based appointments. I'm just wondering if that was a recommendation, or what was the impetus for that to happen on such a large scale.

Dr. Patrick Phillips
It was essentially a requirement put out there. Virtually everybody was doing this and suggestions by the College we now know are our requirements. They treat a suggestion as a suggestion, "you will be prosecuted." So yeah, that's basically what happened. They did have exceptions. If a child was to get a vaccine or if somebody—we were supposed to basically talk to them first on the phone. Then if required, you bring them in for a physical examination. So, there were still physical examinations happening, but it was drastically reduced. And most doctors were depending on patients to kind of report their physical exam.

Commissioner DiGregorio
Thank you. And the last question I had was around the public health officer investigation that you talked about. I think you mentioned that it was after you had submitted your first five reports that you received a call.

Were you not contacted earlier than that as part of the investigation?

Dr. Patrick Phillips
No, I thought I would be. I thought they'd call me because I dictate a lot of my reports. Again, working in emerge., it's not the same as a family practice where you have an ongoing relationship with a patient. When I work that day, I submit my reports and paperwork that same time. A lot of my reports are dictated; they're kind of not fully done yet. So I expected he would contact me back, asking for more information, or asking for— I dictated reports
for my emerge. visit. And they didn't contact me at all, even after I requested him to contact me. Because I was concerned about these rejections.

**Commissioner DiGregorio**
Thank you.

**Commissioner Massie**
Thank you very much.

Based on your assessment of the, I would say, state of the art in terms of evaluating whether an adverse event report is serious or not: What was the protocol that was explained to doctors to guide them to fill out those reports? Did you have access to a specific protocol?

**Dr. Patrick Phillips**
I didn't know about the protocol until after. But in his letter, he sent me the guidance document,

[00:40:00]

for what criteria they use to determine whether something qualifies for an adverse event or not. It is an extensive document. But the number of adverse events they're looking for is very limited, to kind of one and a half pages. For COVID specifically, it was about 10 adverse events they would look at, and if it didn't fit in that category it didn't count.

The one example I liked for how arbitrary a lot of these criteria were, I'll give you one example: If you administer a vaccine and a patient has syncope, they faint, it doesn't count at all, unless they also have an injury. So, if they faint, hit their head, and have a bleeding to their brain, that does count. But again, even in that circumstance, it only counts if it happens within 30 minutes. If that person faints at 31 minutes and then they fall and have a bleeding to their brain, that report will be rejected.

For each category they have arbitrary time requirements and if it doesn't fall within those strict criteria, they're rejected. And these were developed before the COVID vaccines, before Pfizer data that came out in a post-marketing analysis that they were forced to release under a FOIA [Freedom of Information Act] request in the United States showing pages and pages of adverse events of concern. So they had 10—just 10 on this form when there were hundreds to thousands that Pfizer notified and found were adverse events that we should be monitoring for.

My patients didn't fit in those categories of those 10, therefore they were rejected. But we now know that even Pfizer themselves acknowledged a wide array of adverse events that my patients certainly would have been fitting into.

**Commissioner Massie**
Based on your best assessment again, what would you say about the so-called under-reporting factor that, in the States, has been calibrated or has been assessed in the range of 40 to sometimes up to 100. Some people say it's 10-fold. What would be your evaluation on that in your practice in Canada?
Dr. Patrick Phillips
Yeah. I mean, if you look at what happened with me, it shows you what happens when you report adverse events. So, there’s a number of things that happen. One, they often get rejected. So you get pushback from public health themselves. The other one is I got reported to the College and I’m being prosecuted for reporting these adverse events. Even if my adverse events were wrong, even if they weren’t adverse events, how does it make any sense that it’s professional misconduct to report them? People know that. My case is very public. I just use that as an example that doctors know there’s consequences.

There are consequences on a number of levels: from public health; from the colleges, their licences at risk for reporting; and within their hospitals as well. So, doctors—besides their maybe internal biases—even if they didn’t have those biases, their license is at risk from reporting any adverse events.

Yeah, it’s definitely underreported, to answer the question.

Commissioner Drysdale
I have a couple of questions about the CAEFISS system. And some people don’t even understand what that system is. Is it fair to say that it’s very similar to the VAERS [Vaccine Adverse Event Reporting] System in the United States?

Dr. Patrick Phillips
No. It’s the same idea in that it’s vaccine adverse event reporting. The VAERS has problems with its transparency, but it is extremely transparent compared to our Canadian system. So you can go on the VAERS, and you can look at those reports. They’re just de-identified and you can look at them. Anybody can report to the VAERS system, not just your doctor. You can report it yourself. They verify them to make sure that the lot numbers line up and the patient to make sure that they’re genuine. But in Canada, it’s completely opaque. Nobody knows who’s reporting what. And there’s multiple levels of censorship. So the doctor can choose not to report, even if the patient asked him to. Then, even if the doctor does report, it goes to the local public health officer, who is the person tasked with promoting the vaccine and forcing people to get the vaccine, that’s their role. So they have a major conflict of interest in investigating adverse events. They have the ability to reject it.

[00:45:00]

And then they send it to Public Health Ontario, which has the ability to amass the information and filter even more out. And then they report it to Health Canada.

There are so many layers for things to get censored, covered up. And I can tell you, I got an email as part of disclosure for my charges at the College that the public health officer sent on June 11th to the College, saying that my batch of adverse event, none of them were—My batch of adverse event reports were not submitted to Public Health Ontario. So yeah, none of them as far as I know, made it into the system to be able to be reported in the safety system.

Commissioner Drysdale
Did you know prior to submitting those adverse events reports that they were subject to censor?
Dr. Patrick Phillips
No, I did not know that. I didn’t know much about the system. I learned it along the way.

Commissioner Drysdale
Have you had any of your colleagues indicate to you that they were hesitant in reporting to that system, based on your experience?

Dr. Patrick Phillips
Based on my experience, yeah. When people heard what happened to me, then yes, I’ve heard from some that said they wouldn’t report. I’ll mention one more thing that really, I found disturbing to me, that influenced myself and some other doctors. And that was: In that letter, and what I found out about that process is, when the public health officer investigates, and they decide something is not an adverse event, they called up each and every one of those patients that I saw, told them it was not an adverse event, and told them that they’re required to get their next dose. So that’s documented in paper with every single one of them.

That I found very disturbing. What I started to realize is that I’m actually putting my patients in harm’s way by reporting, because they’re going to be at risk of being gas lit in the sense that they’re going to be told that this is not an adverse event, because it doesn’t meet the strict criteria, and therefore they should get another dose of something that could have caused them severe harm.

It’s malpractice in my mind. If somebody had a reaction to Tylenol, we would put that in their chart and say, “don’t take Tylenol.” Even if we’re wrong about it, you want to be cautious and say, “okay, look, stay away from Tylenol, this caused your arm to go numb, don’t take another one.” But instead, when I report them, they’re getting told to take another and they’re told it’s not related. And I realized at some point that it’s actually harmful to patients to report.

Commissioner Drysdale
Prior to the public health officer essentially making a medical determination with one of your patients, are you aware of— Two parts to the question: First, did the public health officer in any instance actually bring the patient in for examination before making a recommendation to that patient?

Dr. Patrick Phillips
No, they called them up, but there were no physical exams in the documentation that I saw.

Commissioner Drysdale
And do you know anything at all—and this is perhaps a bit of a stretch of a question—but do you know anything at all about the public health officer’s clinical experience in treating patients?
Dr. Patrick Phillips
In my area he actually does. He’s a part-time family and emergency doctor and then part-time does the public health office. I think in the majority of places that are more populated, it’s a full-time job. But in my case, he does have clinical experience.

Commissioner Drysdale
Okay, my last question on this is: Is there any practical suggestions that you might make for the future in order to improve this system, the CAEFFIS system?

Dr. Patrick Phillips
Yeah. There’s a number of them. I think we need to follow the VAERS system, where any reports that go into that system need to be available to the public, with removal of identifying information.

There should be a verification process, but it should be more around the details, right? Name, age, date of birth, lot numbers. To make sure it’s a genuine report. But then don’t censor it or keep it hidden.

There needs to be a division of powers when it comes to investigating adverse events from vaccines and promoting vaccines.

[00:50:00]

That’s a major conflict of interest for the public health officer to be tasked with those same things. If you’re pushing these vaccines on everybody, you’re not going to want to see adverse events. You’re not going to want to believe that you’re pushing something that might be harmful to people, so you’re going to be more likely to discount those adverse events. So yeah, I think it needs to be transparent, so they’re submitted right away. The public need to be able to submit them as well. If your doctor doesn’t want to report it, the patient should be able to report as well.

And we need cut-off criteria. How many deaths are we going to tolerate before we pull something off the market? They pulled off treadmills after four people just got injured, no deaths at all. It’s pulled off the market immediately. Breast milk, I think one baby died from baby formula. They pulled it off the market immediately.

At this point, there’s tens of thousands of deaths, credible reports of deaths reported to the VAERS system. It’s still on the market—not only on the market but being forced on people. It’s an atrocity, honestly. But we need that criteria. We need to be, after how many deaths? I would say five. Five credible reports of death, pull something off. We should not be giving this to the public. Maybe even five is too many.

But right now, what’s the point in reporting? The criteria are already met. These things are deadly. They’re dangerous. They kill people, including my own cousin. Autopsy confirmed. And they’re dangerous. The reporting system is useless unless you’re going to act on it. We need to have laws in place that, after certain criteria, a product needs to be pulled off the market to protect public safety.

Commissioner Drysdale
Thank you.
**Commissioner Kaikkonen**

A quick question: is it normal historically for pharmacists to report physicians when they prescribe medications for their patients?

**Dr. Patrick Phillips**

That’s not normal. I’ve never experienced that before. Pharmacists do have a role to verify things and double check things, right? Because sometimes doctors do make mistakes, and that’s legitimate. But in all of those circumstances, they call back the doctor and they ask you to clarify, “Is this what you meant to prescribe? Is this the right dose?” And they’ll often catch things. But I’ve never seen where they go directly—They don’t even call you and they directly report a prescription to the College of Physicians. That’s new, I think.

It’s a snitch culture that’s kind of developed over the course of COVID. And it happened not just with the pharmacists for prescriptions for ivermectin, it also happened with vaccine exemptions. So if you filled out an exemption, a good chunk of the exemptions that I filled out were sent to the College from employers as well. So yeah, I think it’s a cultural thing that’s happened. It was seen in totalitarian regimes like Russia and Germany, and it’s part of the totalitarian experience.

**Commissioner Kaikkonen**

My last question is, if you had to do this all over again, would you do anything different?

**Dr. Patrick Phillips**

Yeah, I would. There were a few things that I would have done differently. Essentially, no. Like on all these things, reporting adverse events or other things: maybe looking back now, seeing those patients that got called and told to get another shot, maybe I wouldn’t have reported them as much. Or I would have stopped earlier. I would have still told the patients, like, “Look, don’t get this.”

But essentially, no. I think I made the decision according to my conscience at the right time. And I learned so much along the way. Of course, there’s always things you would have done differently if you went forward. But as far as providing treatment with ivermectin, providing exemptions to people who are being coerced against their will into gene therapy, for reporting adverse events, and for speaking out to give people the other side of the story: the facts, the scientific facts, the harms, the lockdowns, and other things. I would totally do that again, even knowing I would lose my license.

**Commissioner Kaikkonen**

Thank you, Dr. Phillips.

[00:54:44]

**Final Review and Approval: Jodi Bruhn, August 3, 2023.**

Witness 4: Cathy Careen
Full Day Timestamp: 03:32:00–03:53:30
Source URL: https://rumble.com/v2ddo8a-nci-truro-day-1.html

[00:00:00]

Ches Crosbie
There’s Cathy. How are you today, Cathy?

Cathy Careen
I’m very well, thank you. How are you?

Ches Crosbie
I’m well, thank you as well. It’s a great room of people here who seem to be very interested and enthusiastic to hear all the evidence, including yours.

I’m going to ask you first, though: do you affirm to tell the truth, the whole truth, and nothing but the truth?

Cathy Careen
I do.

Ches Crosbie
Thank you.

Criss Hochhold
Hi, Cathy. We meet again.

Cathy Careen
Absolutely. Before we start, though, I do really want to thank everybody involved with this and just giving everybody an opportunity to speak their experience and share what they’ve experienced for the past few years. It’s an honour to be able to speak here today, so thank you for that.
Cris Hochhold
You're welcome, Cathy. So, tell us a little bit about yourself, Cathy. What do you do?

Cathy Careen
I'm an educator. And I say educator because I am a teacher by trade. But when I was working in the school system, but not as a classroom teacher, I was what was called a TLA, a teaching learning assistant. So, when all this happened, I was full-time permanent.

I'm a mom. I have three kids, ages 7 to 21. I'm a big animal lover, and, you know, I'm just an average person.

Cris Hochhold
Absolutely. What do you teach, Cathy? Do you still work as a TLA now?

Cathy Careen
So, we were able to go back to work last June 1st, and then I did. And then I went back in the school year, starting in September. So I worked with Newfoundland and Labrador English School District. And then I just got this other job opportunity, which I just thought I would explore. It was more money, and not that that's really the issue, but given the fact that I was unemployed for a number of months, our family was financially stretched. So I really had to explore this opportunity and see. My heart is still in education, and I do hope to go back at some point.

Cris Hochhold
Absolutely. How long were you working as a TLA?

Cathy Careen
I've been in the school system with the NLESD since 2007, sometimes replacement. I've moved in and out of doing different things. I've consistently worked with young people; I've worked with Choices for Youth in the past. So as a TLA in this permanent position, that was—I guess this is my fifth year. 2019 is when I started.

Cris Hochhold
Okay, excellent. What grades are you mainly involved with?

Cathy Careen
My school is K to [Grade] 4.

Cris Hochhold
K to 4. And the ages that you typically teach will be—?

Cathy Careen
The way that the TLAs are support, so we basically helped the teachers. So, I was most often with the K to 2. They were 5 to 7 years old.
Okay so just starting out in life really.

Cathy, in your submission to the NCI, you had stated that you were diagnosed with Guillain-Barré Syndrome.

Yes.

Can you tell me more about that, please?

So, I am a Newfoundlander, but I was living in Ontario. Just after I moved back home to Newfoundland, I became ill with— I had pneumonia and I was experiencing really weird symptoms. I was getting hives and weakness in my extremities. And just without sharing all the details, I ended up— Nobody really knew what was wrong with me. I went to emerg...
immune system was attacking the myelin sheets around my nerves, that was preventing
my brain from communicating and doing certain things. I know of people who’ve been
paralyzed to the point that they were on respirators.

Thank God that did not happen to me. But I was essentially paralyzed. I couldn’t do
anything for myself. I couldn’t lift my arms. I couldn’t feed myself. I couldn’t comb my hair. I
couldn’t dress myself. I couldn’t go to the bathroom without help.

And so then, once I was considered medically stable, I was moved into the Miller Center,
which is a physical rehabilitation center in St. John’s. A lot of times you’ll see stroke
patients there. And so, I stayed there then for four weeks as an inpatient. It might have
been six, but for sure it was four. As an inpatient, where I had intensive physiotherapy and
occupational therapy to try to get myself back to where I was—even though sometimes
people are not lucky enough to get back to where they were and have long term residual
effects.

But I was a mom. And not being able to hug my children, it was really hard. That was a
thing that got me through—was thinking about getting back to my kids. After a lot of hard
work—I used to be able to go home on visits. Sometimes on the weekends, sometimes in
the evenings just for a few hours. But on the weekends, there were certain stipulations that
my family had to have. There had to be a bed on the main floor. I was allowed to go home
on weekend visits to visit my kids.

I remember one night sitting in a wheelchair and not being able to move. And my little 18-
month-old, this toddler, fell flat on her face. And your instinct is to hug her, and you just
can’t move. And I had to sit there and just watch her cry while I summoned my mother-in-
law to come pick her up and console her.

It was very surreal, a very traumatic experience for me. As you can see, I can move, I’m back
to normal. My neurologist said it was pretty much miraculous that I gained the recovery
level that I have. I should be very grateful for that. Now, I do have residual effects. I don’t
know how to describe them, they’re like pins and needles in my extremities sometimes. But
they’re more intense than that. It’s more like razors. And they just kind of come and go. And
I do have a lot of tight muscles that I regularly have to get massage therapy and stuff for,
like in my legs and hips.

After discussions with my neurologist—I have a letter that I submitted to you, where he
said to my family doctor that it was advised for me not to get. He specified vaccinations in
the letter as pneumococcal and influenza, which really, at that time, the only respiratory-
type vaccinations that were available. But in our conversations, he would discourage me
against vaccination period. Unless there was, you know, a way to benefit sort of deal.

So I’ve kind of lived my life that way for 15 years. Not as an anti-vaxxer.

I have three children; my children are all vaccinated. My pets are all vaccinated. I was not
an anti-vaxxer.

But just to give you a level of an idea of the kind of support I had for this: because, since I
recovered from Guillain-Barré syndrome, we had the H1N1 epidemic, that outbreak. And,
you know, my family doctor was a doctor who I had with Guillain-Barré syndrome. I was
her first Guillain-Barré patient. And she always, always supported me with this. So the
conversation around H1N1— I was a substitute teacher at the time. Classes were filled with sick children going home during the day and that sort of thing.

She wanted me to get my children vaccinated and my husband vaccinated for what she considered herd immunity to protect me, because I wasn’t going to get vaccinated against H1N1. And that was what we determined together as a team: well, no, you can’t be getting vaccination. So, I’m not an anti-vaxxer but I typically never got my children vaccinated for influenza. I really do believe, when it comes to influenza, healthy children should just deal with that growing up. I think that’s part of building your immune system. And after some serious thought, I was like, “Okay, maybe I should have gotten it, a lot of young people are dying.” So, they did get vaccinated.

But I, on the other hand, continue to teach out in the school system. So, one night I get a phone call from my family doctor who was very concerned about me out there teaching. She just said, “I’ve been thinking about you. Would you mind if I put a prescription of Tamiflu at your pharmacy for you? So that if you get any signs whatsoever of this H1N1 influenza, that you go get it.” Now, I never needed it.

Another example is I used to volunteer with Therapy Dog. I volunteered at the Janeway here, which is a children’s hospital. And I volunteered in seniors’ homes. Now, you have to always get your tests, do the tuberculosis test. You submit your vaccination record and that sort of thing and your MMR. My MMR comes back as inconclusive because I was born before 1982, when we only got one shot. Now, I could get another one, but they advised against it.

Even when it came to the tuberculosis test, where they insert a little bit of the virus under your skin: again, they found the alternate blood test for me so I could go volunteer in these places. Now, I don’t remember exactly, but I believe I did have to sign a waiver for volunteering at these, but I was allowed to go. I was allowed to go.

So, when it came to this vaccine, I was very vigilant. I started listening to people, reading things as quickly as I could just to see what this was about. I was scared too of COVID.

**Criss Hochhold**
Cathy, let me just quickly interrupt you then. You’ve got a wonderful flow going. I really appreciate the wealth of information you’re providing us. I’d just like to ask a couple of clarifying questions.

What year was the original diagnosis of your Guillain-Barré syndrome?

**Cathy Careen**
November 2006.

**Criss Hochhold**
So that was in 2006. And you said there was a neurologist there at the time that happened to be there. And I do have a letter, and I will forward that to the commissioners as well for consideration: the medical exemption and recommendation. But the neurologist suggested to you in writing not to get any vaccines because of the potential hazards associated with it, is that correct?
Cathy Careen
Yes.

Criss Hochhold
Yes. Okay. Now, you may not remember the exact conversation that you had with your
general practitioner—your family doctor—in regards to the vaccine. Specifically, let’s say
to the COVID-19 vaccine. Can you surmise potentially the conversation that you had with
your physician?

Cathy Careen
I grappled with getting this when I knew it was going to possibly be mandated. I wasn’t
sure what to do. Let me be clear: I really did value my family doctor. I felt I had a really
good relationship with her, so I called her just to talk this out with her. In all fairness, she
didn’t push it on me. But she didn’t have—or didn’t express—the same kind of concern
that she did, for example, when H1N1 happened. It was basically, “Well, this is what we’re
recommending, and we recommend everyone to get it.”

She didn’t want to see me lose my job. So, she did agree to write a letter for me—again
which I submitted to you as well. Because what happened, so you know— I listened to
different sources of information. I’ve often followed the GBSCIDP.org website.

[00:15:00]

They had a whole section for people like myself, who were feeling like survivors.
Apparently in December of 2020, Dr. Fauci recommended against the vaccine for people
who were— Sorry, survivors of Guillain-Barré syndrome. And this organization actually
wrote an open letter to Dr. Fauci asking that he reconsider that. There was a doctor on that
website as well. Dr. Peter Donofrio, I believe his name was, was this chairman of the Global
Medical Advisory Board. And I watched a video from him where he talked about how
miraculous these vaccines were: 95 percent effective, no adverse effects.

So, as time went on, there was a news story that came out, Global News out west, I think it
was dated June 17th. It was of a gentleman who had gotten Guillain-Barré syndrome from
the vaccine and was seeking compensation. And in that news article, there were, I think, 14
people identified in Canada who were getting Guillain-Barré syndrome as a result of the
vaccination.

I followed what was happening in the States. I followed people like Dr. Peter McCullough,
who spoke earlier, and Dr. Robert Malone and their concerns. And the more I had those
conscious—and, like I said, I had concerns anyway just with vaccination. I’ve lived my life 15
years without that. When there was outbreaks of anything at school, hand washing
essentially is what I did.

So when our premier met with Francois Legault, who—Quebec had already had the
mandates. I felt, okay, that’s exactly where we’re going, and we did. I reached out to my
union on September 29th to express my concerns. At no point was I what you’d call angry. I
wanted to change the conversation, because I felt like this was just too black and white of
an issue.

Not that my concern is any more than anyone else’s concern. But I know there had to be
people like me, who had similar concerns, whether it was just because it was a new vaccine,
or they had something like blood clot issues, or—and you couldn’t even have the conversation.

So my doctor did write a letter for me. But in that same letter she basically confirmed my diagnosis, said that I was advised of the COVID vaccine benefits. And I declined because of the small chance of relapse. And my neurologist told me that relapse—So the average population has a one in 100,000 chance of getting Guillain-Barré syndrome. Mine was now increased significantly because of having it again. It is still rare, don’t get me wrong. It’s still rare, but it’s there. And my neurologist also emphasized the importance of being healthy. I take my health very seriously now. I mean, I suppose I always did on some level, but probably even more so now.

So it’s not something I took lightly. And the way I see a vaccine: Why would I stimulate my immune system, which has already shown that it can turn on me on purpose? If I get a cold or pneumonia or something, I mean, I do my best to avoid that. I do my best to avoid getting sick. I take my vitamins, I exercise, I go outside. I wash my hands—

Criss Hochhold

Cathy, I think it sounds like you’re taking all the necessary caution that are best for you to make sure that you’re as protected as you can be without taking a vaccine. And I hate to interject, but we are running a little bit short on time. I really appreciate your story. I know you have much to tell us, but unfortunately, we have such limited time.

I just have one final question before passing on to the commissioners if they have any. Just briefly: How has this experience affected your financial situation with your family? Because I believe there was an impact there, too.

Cathy Careen

Well, I was put on paid leave. I went through the whole process of my union. I was advised to seek an exemption. That’s not what I originally wanted. I wanted to just grieve the process in the beginning because I felt everyone should have a choice. I applied for EI [Employment Insurance]. I was denied. I appealed it. It was denied. On my ROE [Record of Employment], it says that in the little note box I was unvaccinated as for the mandatory policy. I had no source of income. My elderly parents were on standby, ready to sell their house so I wouldn’t lose mine.

It put a lot of stress in our house, obviously—me not working. My kids got to see me being stressed.

[00:20:00]

I cried pretty much every day, because it’s just a disbelief. I sit home and I was like, “I can’t go to work, I’m not allowed to go to work.” Even now, I still have trouble processing that.

Criss Hochhold

It is difficult to believe that, even with a medical exemption, your record of employment—which will be in exhibit for you—actually mentions in the comment section, “not vaccinated as per mandatory policy.”
Cathy Careen
Thank you. I was going say, I did try all the regular ways to have the conversation. I reached out to my union before the mandates. I reached out to local radio talk show hosts. I reached out to politicians. I wrote an eight-page letter to our premier and I got no response.

Criss Hochhold
Thank you very much, Cathy. I really appreciate your time. Just if there are any questions from the commissioners, please.

No? Okay, there are no questions.

Cathy, once again, thank you very much. I really appreciate your time and I wish I would have more time to listen to more of what you have to say.

Thank you very much.

[00:21:30]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

Witness 5: Shelly Hipson
Full Day 1 Timestamp: 04:42:47–05:37:30
Source URL: https://rumble.com/v2djjsi-nci-truro-day-1.html

[00:00:00]

Ches Crosbie
The Commission is back in sitting, and I’d ask us to come to order, please. Thank you. Next witness is Shelly Hipson. Shelly, I’d ask you to affirm that you intend to tell the truth, the whole truth, and nothing but the truth.

Shelly Hipson
I do.

Ches Crosbie
Thank you.

Gayle Karding
Good afternoon, Ms. Hipson. If you could just tell us what brings you here today. What role have you played in this situation?

Shelly Hipson
Over the last two years, I’ve been interested in finding out the truth from government. In order to do that, there’s a process called Freedom of Information. Online you can pay $5 and request any record, and so I became kind of obsessed. I got lots and lots of records, 80 to 100 records, trying to piece this all together.

Gayle Karding
So, just walk us through, very briefly, how you do that and what exactly you can ask for.

Shelly Hipson
You can’t ask a question, or you can’t ask for analyzed data. You have to ask for a specific record. So, you may ask for a record about vaccines and adverse reactions to the vaccines, hospitalizations. There’s the Department of Health and Wellness, and then there’s the Nova Scotia Health Authority. The Department underneath that has a Public Health Branch:
that's where Dr. Robert Strang would be working. And then separate from that is the Nova Scotia Health Authority, which is a registered charity. And you're also able to do Freedom of Information requests to both of those entities.

**Gayle Karding**
You brought hard copies of a selection of your, we'll call them FOIPOPs [requests under The Freedom of Information & Protection of Privacy Act], just for ease of reference. I take it these aren't all of them.

**Shelly Hipson**
Oh, heck no. I've got about four large, huge binders, so I was very kind to you guys. You've got the mini version of some of the highlights, and I hope that it presents enough of the picture of what I've accumulated.

**Gayle Karding**
Just to be very clear, every single document that we're going to be looking at today, the source is government?

**Shelly Hipson**
Yes, it's a government document. It's something that's come directly from those departments or the Nova Scotia Health Authority.

**Gayle Karding**
And specifically, I think, with the exception of maybe one or two pieces of paper, these are all specifically from the Nova Scotia government?

**Shelly Hipson**
Yes.

**Gayle Karding**
All right, for ease of reference for you explaining this to us, as well as for the Commissioners, we've divided these FOIPOPs into basically three temporal periods. So, why don't you start with describing what is the first temporal period that we're dealing with, and then you can start walking us through the information that you have received.

**Shelly Hipson**
What I wanted to start with is a foundation, and that foundation piece is in your binder. It's Nova Scotia Health Authority zero eight two. What that provides us goes back to 2015. So, 2015, 2016, 2017, 2018, 2019, 2020, and 2021. What we're looking at are the ICUs, the total ICUs throughout Nova Scotia. It's a big one like this, if you want to follow.

So the Nova Scotia Health Authority ICUs, and then Aberdeen Hospital, Cape Breton Health Care, Colchester, Cumberland, Dartmouth, QE2, South Shore, St. Margaret's Valley Regional and Yarmouth Regional at the top. This provides us with a scope, a context.
We can see from looking at this, in 2020, if we go down to ICUs and hospitalizations, the total for 2020 was 7,306.

**Gayle Karding**

Seven thousand, three hundred and six, what?

**Shelly Hipson**

ICU hospitalizations.

**Gayle Karding**

Okay.

**Shelly Hipson**

If we go up to 2015 and look at the total ICUs in that first column, we can see that, in 2020, it was the lowest number of ICUs since 2015, at the 7,306. Other years were 7,906, 8,300.

[00:05:00]

You would have thought maybe a pandemic would have been in 2016, as that was the highest.

2017: 8,014.
2018: 8,005.
2019: 7,708.

And we go down to 7,306 in 2020. And when we add those ICUs together for 2020, the 7,306 - I've just added to July, for example, because I have other documents that go along with that timeline - there were 12,220 ICU's.

**Gayle Karding**

Tell us where you found the 12,000 number?

**Shelly Hipson**

It's the 7,306 total for 2020 and then I've added January, February, March, April, May, June, July of 2021. I didn't include August and September because other documents go along just to the end of July. That totals 12,220. So, if we can remember that number, around 12,000 people went into ICU for about a year and a half of the pandemic.

**Gayle Karding**

So just to be clear, this very large document, essentially what it is: the NSHA-082 was multiple pages, and all you've done is tape them together so that it's visible all at once.

**Shelly Hipson**

Yes, we can also see in March 2021 that the number of ICU beds went from 121 to 117. So even in a pandemic, they were reducing the number of ICU beds. This happened throughout several hospitals. For example, Cumberland went down two, Cape Breton went down one,
Aberdeen Hospital went down four. So, it’s just an interesting observation to me during a pandemic, that there would be a decrease in hospitalizations overall.

**Gayle Karding**
As well as a decrease in the number of ICU beds available.

**Shelly Hipson**
Yes. So when somebody says there’s four people in hospital it can give us a reference, but there’s a lot of beds there. So it’s a helpful tool.

**Gayle Karding**
Okay, and you’ve put some yellow highlights, at least on my copy. Have you done that on the commissioners’ copies?

**Shelly Hipson**
I sure hope so. That was my intention last night. I’m trying to get them done.

**Gayle Karding**
So those are not original to the documents, obviously.

**Shelly Hipson**
No, they’re not. Just to help people see what I’m trying to do here: If we turn the page in your document, everybody was hearing and being bombarded with the ICUs and the hospitalizations. I was curious what was really going on, so I did a Freedom of Information request: How many ICU hospitalizations were there each month for COVID-19 in 2020 and for each month up to, including July? So, when I did that, this is what I got back, was this one.

**Gayle Karding**
It’s entitled COVID-19 ICU hospitalizations.

**Shelly Hipson**
And if we want to take a brief look at that, we can glance down again by hospital. And these are just your 10 ICU hospitals. So out of the 10, five of them had no ICU hospitalizations for a year and a half into the pandemic. Aberdeen, Cumberland, South Shore, Regional, St. Martha’s, and Yarmouth had no ICU hospitalizations. If we look at the rest of them, they are less than five.

**Gayle Karding**
With the exception of the QE2. On a couple of occasions.

**Shelly Hipson**
Yes.
Gayle Karding
Okay, and when you say ICU hospitalizations, this is specifically referring to in the COVID-19 units?

Shelly Hipson
Yes, this is COVID-19 ICU hospitalizations. So when we look at the 12,220 ICUs that happened during that same period on the first sheet that I gave you—there's another little sheet, because I told them that I couldn't add these at the bottom—so there's another one. We can see that Aberdeen had zero, Cape Breton Health Complex had ten, Colchester Regional had nine, Cumberland zero,

[Dartmouth five, QE2 74, South Shore zero, St. Martha zero, Valley Regional 12, and Yarmouth zero. When I work those out, basing it on the number of ICUs in this first one, they are all less than 1 per cent. So COVID ICU hospitalizations were less than 1 per cent.]

Gayle Karding
Okay, what's the next document that you have here?

Shelly Hipson
So that dealt with ICUs. The next one: "Well," I thought, "they're not in ICU, maybe they're all in general admissions." So I did a combination, and that's Freedom of Information NSHA 2021-173. And that's quite a long one. You're probably going to have to stretch it out here.

Gayle Karding
In the next one that I have—Oh, you've got a long one, okay.

Shelly Hipson
Yeah. It should be in the orange in the back. And just to give the audience sort of a visual as well, I've highlighted the yellow, which would be zero hospitalizations and ICUs throughout Nova Scotia.

Gayle Karding
You mean specifically—and I'm looking at this document reading it—you mean specifically COVID hospitalizations?

Shelly Hipson
COVID, ICUs and general hospitalizations. The vast majority, I was quite surprised: There's no one there. It's pretty empty of COVID.

Gayle Karding
It would appear that there's a number of spaces here that are blocked out with a section 20, sub 3, sub A cited.
Shelly Hipson
Yes—anything less than five, they blank them out. They gave me the reason that if it’s one person, I may be able to figure who that person is. So it’s to protect their privacy. It’s interesting they black them out for their privacy.

But anyway. So, that’s what that is. They’re still all less than five.

Gayle Karding
Okay. Have you provided the document where they provided that explanation in the binder?

Shelly Hipson
Yes, it’s one of the Freedom of Information responses.

Gayle Karding
Okay.

Shelly Hipson
I did ask them for an update on this one, and if we turn the page—it’s not always easy to get. The update: they wanted to charge me $2,190. So, freedom of information sometimes is not free. They may put stumbling blocks, I feel, in your way to be able to access that information. I just stuck that in.

Gayle Karding
Let’s just back up. I want you to explain, or just clarify, that first NSHA 2021-173. What was the period over which you were seeking and obtained this information? Over what period?

Shelly Hipson
That went for the year 2020 and up until October 2021.

Gayle Karding
So, January 2020 to October 2021.

Shelly Hipson
To October 2021, yes.

Gayle Karding
And when you asked for the update, what was the period that you sought in NSHA 2022-047 that was going to cost you $2,000?

Shelly Hipson
I asked for November, December, January, and February, so four months.
Gayle Karding
And that was going to cost $2,000?

Shelly Hipson
Yes.

Gayle Karding
Had they asked for any additional funds in the original NSHA-2021-173 to give you the same information, for the period of a year and ten months?

Shelly Hipson
No.

Gayle Karding
So that will cost you $5.

Shelly Hipson
Yes.

Gayle Karding
What ended up happening to your updated request?

Shelly Hipson
I redid it and I broke it apart. I do have it a little bit further on and it gives us an opportunity to compare what was happening in 2020-2021. Then it shows something kind of significant at the beginning of 2022. I have that more towards the end.

Gayle Karding
Okay. So just to put some of this into our situational context, this long document is related to NSHA 2021-173 and includes all of the COVID hospitalizations and ICU hospitalizations of January 2020 to October 2021. The vaccine began to be rolled out at the end of 2020, December 2020. Does that sound about right?

Shelly Hipson
Mm-hmm.

Gayle Karding
Okay. So far, it would appear, looking at this these numbers, that they seem to remain consistent up until October 2021. Is that fair?
Shelly Hipson
Yes.

Gayle Karding
All right. So, the next FOIPOP that you want to address is what?

Shelly Hipson
It’s a comparison of deaths from diseases of the respiratory system from 2019 and comparing it to 2020. We were told there’s so many COVID cases. What was really going on with all of the respiratory illnesses? And that is this sheet here.

Gayle Karding
This is 2022-00455-SNSIS, standing for Service Nova Scotia and Internal Services. March 30, 2022?

Shelly Hipson
Correct. We have 2019, and we can see, we’ll just scan right down. We’ve got influenza 42, pneumonia 148, other chronic pulmonary diseases 496, et cetera. It totals 895 total deaths from diseases of the respiratory system. So, 895 in 2019.

In 2020, if we scan down all of those as well—and that includes 66 of COVID-19—there’s 827. So, 895 in 2019, 827 in 2020. It actually decreased by 68 during that period.

Gayle Karding
Now, this particular graph, is this one that you produced?

Shelly Hipson
It’s one that I produced. The actual documents I’ve put in your binder. The hard copy data. I’ve just put them into a graph so that we can compare what happened between the two years.

Gayle Karding
Okay, so you’ve done, not really an analysis, but you just reorganized the data, pulled the ones that were specifically respiratory, and put it into this graph. But you’ve provided the actual FOIPOP where you sought records providing total number of deaths per month in Nova Scotia for 2019, 2020, 2021 and so far in 2022, as of March 30th. Records showing a breakdown with totals of causes of death for 2019, 2020, and 2021. What you were provided had a lot of other causes of death as well.

Shelly Hipson
That’s right.
Gayle Karding
Okay. And you’ve highlighted for the commissioners which ones you’ve used to put into your graph. If they wish to double check your work, or confirm those numbers, they can do that.

Shelly Hipson
That’s right.

Gayle Karding
Okay. And so, this is a comparison of 2019, which is pre-pandemic and the first year of the pandemic which was 2020.

Shelly Hipson
That’s right. I asked for 2021, but it was incomplete, so I wasn’t able to use that data.

Gayle Karding
All right, would you like to move on to the next?

Shelly Hipson
So, we are at 2021-015-75HEA. The important thing here, I feel, if we just turn to the second page; it’s page one, just after the FOIPOP. I highlighted in your binders a deceased case. And I’m just going to read that out to you, because it is quite concerning to me that this would be the definition.

Gayle Karding
Let me just back up for everybody’s benefit. We’re talking about a FOIPOP request made on December 15th, 2021. Is that when the response comes?

Shelly Hipson
That’s the response. I made it on August 19th, 2021.

[00:20:00]

Gayle Karding
Okay, and this is what you had sought from the government. You had sought the definition of a COVID-19 case, and a couple of definitions, including how they define a deceased case, and so on.

Shelly Hipson
Exactly, yes. So, a deceased case, that’s on page one: “A probable, or confirmed COVID-19 case whose death resulted from a clinically compatible illness. Unless there is a clear alternative cause of death identified such as, example, trauma, poisoning, drug overdose.”

I’m going to read it again. “A deceased case: a probable or confirmed COVID-19 case whose death resulted from a clinically compatible illness. Unless there is a clear alternative cause
of death”—trauma, poisoning, or drug overdose. “A medical officer of health, relevant public health authority, a coroner, may use their discretion when determining if a death was due to COVID-19. Their judgment will supersede the above-mentioned criteria. A death due to COVID-19 may be attributed when COVID-19 is the cause of death or is a contributing factor.”

So, a COVID-19 death may be attributed, or is the cause of death: the public health authority or coroner may use their discretion and it can be from a clinically compatible illness.

Gayle Karding
Okay.

Shelly Hipson
Page 4, Table 2, COVID-19 cases. It’s just interesting to note that out of a total of 5,884 confirmed cases, one quarter of them were asymptomatic. In Table 3, number of deaths of asymptomatic people are zero. I started to question the whole testing of asymptomatic people. So it’s interesting how many had no symptoms.

If you don’t have any questions there, I’m going to go right to the next—

Gayle Karding
Okay, I don’t believe that I do. This particular FOIPOP covers March—or the graphs cover—it would appear, March 2020 to August 2021.

Shelly Hipson
Right.

Gayle Karding
Okay. And these graphs, just to clarify, because some of these graphs you’ve made—These graphs are ones that were included in the response as they appear from the government.

Shelly Hipson
Yes.

Gayle Karding
Okay.

Shelly Hipson
So the next Freedom of Information is Nova Scotia Health Authority 2021-185. And what I asked for was, “any record, proof, document, report that an asymptomatic positive COVID-19 case is contagious and spread to others in Nova Scotia.” The response is: “We have conducted a thorough search of our records, but we were not able to find any records responsive to your request. We are now closing the file.”
Gayle Karding
Okay, and that was on December 7th, 2021.

Shelly Hipson
Mm-hmm.

Gayle Karding
So that one seems to speak for itself.

Shelly Hipson
Yeah.

Gayle Karding
Okay, the next document is a graph. And I take it that this is one that you produced right?

Shelly Hipson
Yes, it is.

Gayle Karding
And just to highlight for the commissioners, the sources of your information of the numbers that you've put in here are entered in the middle there where it says FOIPOP, and it provides a number. Is that right?

Shelly Hipson
Yes.

Gayle Karding
Okay. And then the percentages are something that you did.

Shelly Hipson
That's my calculations.

Gayle Karding
Based on the numbers that are in the documents cited here.

Shelly Hipson
That's right.

Gayle Karding
Okay, so can you just very quickly walk us through what this is?
Shelly Hipson
Okay, so I just wanted to put it in context. The population of Nova Scotia is just over a million people. In 2020, there were 238,474 tests done. And in 2021, 1,347,912. That’s totaling just over 1,500,000 tests that were completed. Comparing that to our population,

[00:25:00]

that’s a substantial number of tests. Of course, there could be people that are retesting, but that’s a lot of tests. The negative tests were 1,564,648. So out of all of those total tests for two years, 20,446 were positive.

The number of people that died was 114. We know of those 114 in that first year, at least that 53 of them died at Northwood, a long-term care facility. Those are my percentages, so I’m just going to skip over those. The number of people that die in Nova Scotia: it’s approximately 10,000 people a year. So, 20,000 people died in those two years, and 114 of them were from COVID.

Gayle Karding
Attributed to COVID.

Shelly Hipson
Attributed to COVID, yes. It’s a very low percentage, which leads me into the next Freedom of Information response, which would be about the comorbidities. A hundred and fourteen people died. At least 53 of them were in long-term care. So, I wanted to know what else was going on? Why did they die? In order for me to stay healthy and my grandmother to stay healthy.

So the next one was Freedom of Information 2021-01142. I asked for the comorbidity data that the people had who died with or from COVID-19, including ages, sex, any information, or studies that has been gathered on those who have died with COVID-19 in Nova Scotia.

And the next one is this. And we can see in Table 1, that 86.7 per cent of them were 65 years and older. Only 13.3 per cent of them were under the age of 65. Down in Table 3, we can see that cancers were 6.7 per cent, cardiac disorders were 60 per cent, chronic renal disease was 11.1 per cent, diabetes was 21.1 per cent, immunocompromised conditions were 5.6 per cent, neurological conditions were 54.4 per cent, and pulmonary disorders were 18.9 per cent. And most of them were in long-term care. So just to add context to that.

Gayle Karding
Okay, I think now we’re moving into the next temporal phase, where we’re talking about after the rollout of the vaccine. We do need to pick up our pace a little bit to make sure that we get everything in. So, let’s introduce your documents and the commissioners would be able to mostly consider the documents themselves. What’s the first one you’re speaking to—2021-01590-HEA?

Shelly Hipson
That’s one of the first ones that I did that I learned about the adverse events following immunization. I’m going to leave that for them to read, due to time.
I'm going to skip to 2022-01349. And in that Freedom of Information request, made on August 29, 2022, I asked for correspondence, reports, documents given to, sent to, reported to, received by Dr. Robert Strang from doctors, pharmacies, medical officers, hospital administration, long-term care, nursing homes administration, on the topic of COVID-19 vaccine adverse events, side effects, and deaths that have occurred since it was rolled out in our province. This would include correspondence and reports on adverse events and deaths that are temporarily associated with the vaccine that have not been clearly attributed to other causes, that Dr. Robert Strang has in his possession.

Page one, Dr. Robert Strang is sending out references for communication. We saw how, across Canada, the chief medical officers seemed to parrot a lot of lines. I can understand that now because it was included in this particular Freedom of Information response. We see Dr. Bonnie Henry, Dr. Dina Hinshaw, Dr. Teresa Tam all being included in this.

Gayle Karding
Okay and this one refers to media lines.

[00:30:00]

Shelly Hipson
Yes.

Gayle Karding
So, they're indicating how people should discuss this in the media.

Shelly Hipson
With the public. Yes.

Gayle Karding
Is there anything to highlight there in particular, or just that they all have the same media lines distributed to them?

Shelly Hipson
On page 5, January 21st, 2021. That's only about a month after the rollout. Question 3, "Can vaccinated people spread the virus to others?" "There is limited evidence on whether someone who received the vaccine is still able to spread the virus.” So here we were told that it was safe and effective, but that clearly states that there is limited evidence on whether someone who received the vaccine is still able to spread the virus.

"Everyone must continue following public health measures regardless of vaccination with COVID-19 vaccines to protect themselves, their loved ones, as well as people and communities at risk of more severe disease and outcomes of COVID-19."

Page 13 are emails to and from Robert Strang and their medical officers. The first one is: "Hi Rob. In case you receive any queries, I’m looking into an adverse event following immunization following the death of a resident vaccinated in long-term care. A female received a Moderna COVID-19 vaccine and died."
So that’s one, and I’m just going to flip through them. Another one: “Hi everyone. Please be aware of an adverse event following immunization reported today and confirmed”—and I’m not even going to try to pronounce that word—

**Gayle Karding**  
Encephalopathy.

**Shelly Hipson**  
Thank you. “Develop neurological symptoms.” Another one, a serious adverse event, vaccine-induced immune thrombotic thrombocytopenia.

**Gayle Karding**  
Is that on page 167?

**Shelly Hipson**  
That’s on page 16, yes. So, with that one they choose to notify the Premier’s office. There are people that have adverse reactions, including swollen, tingly lips, closure of the throat, and they are still recommended to proceed with their second dose of the vaccine.

**Gayle Karding**  
Can you cite page 19?

**Shelly Hipson**  
Sorry page 19. On page 24, it’s just interesting: “Some adverse events are identified during the clinical trial process. However, new issues can arise once a health product is on the market because it is being used by a much larger number of people.” Very much larger.

Page 27, again. Just itchiness and swollen throat after a Pfizer shot. Shelley McNeil is going to assess this situation. And this is after the second dose actually. And they— Of course, I mean, they were allergic to the first one. No big surprise. Immediately experienced headache, itchiness, flush. So the second one, the same type of reaction.

Page 29. “Some unusual adverse events following immunization came in today. Stroke, thrombotic events, thrombocythemia alone, thrombosis, thrombocytopenia.”

They knew—this was in the first few months—that people were having these adverse reactions to the vaccine.

**Gayle Karding**  
I guess I should have been asking you for dates. That most recent one that you just cited where there’s stroke, thrombotic events, pulmonary embolism: that was April 15th, 2021, for example.

**Shelly Hipson**  
Yes.
Gayle Karding
And the earliest one that you cited was January 24th, 2021?

Shelly Hipson
Um-hmm.

Gayle Karding
So those are all between those dates.

Shelly Hipson
Yeah.

Gayle Karding
Okay, so let's move on to the next set.

Shelly Hipson
Zero-two-one-two-four. I asked the same thing—

Gayle Karding
This is for a different time period, I take it.

Shelly Hipson
A different time period. I had to break that one down because I couldn’t get it all at once. They were going to charge me some money, so I broke it up. Page one at the bottom: we can see allergic reactions, anaphylaxis to one, two, three, four, five, six, seven—continuing on page two—eight people.

[00:35:00]
Neurological reaction. Female receives a Pfizer, excuse me, vaccine and has a seizure.

If we scan down, some of those are pericarditis, hyperthyroidism, rashes, pulmonary embolisms.

A male receives a Moderna shot, rash toes then serious and hospitalized. A male gets Pfizer and has a cardiac arrhythmia, thrombotic stroke, pericarditis, ischemic stroke, ischemic stroke, hemorrhagic stroke.

Gayle Karding
I'm just going to stop you. So what's interesting about this set is that at this point in June of 2021, they're now breaking down their emails to Dr. Strang into five-day increments.

Shelly Hipson
Yes.
**Gayle Karding**
This particular email is addressing June 7th to 11th, of 2021. They've got eight allergic reactions. They've got one neurological reaction, eight that they consider non-serious—but it includes a pulmonary embolism as well as a vitreous detachment and pericarditis. And then they've got six serious hospitalized, which you've just read to us there. A couple of ischemic strokes, hemorrhagic strokes, pericarditis, thrombotic stroke, and so on, and a death, which appears was due to pulmonary embolism. That's all in a five-day period?

**Shelly Hipson**
Yes.

**Gayle Karding**
And Dr. Strang's response was: "Will be interesting. So do we have serology for specific cases?"

**Gayle Karding**
He responded to that, indicating that he had seen it.

**Shelly Hipson**
Yes.

**Gayle Karding**
Okay. So then moving on very quickly through the next—

**Shelly Hipson**
It's the same sort of thing: anaphylaxis, allergies, pericarditis.

**Gayle Karding**
This is June 14th to 18th?

**Shelly Hipson**
Yes, June 14th to the 18th. Seizures, ischemic stroke. Again, pericarditis. Another pulmonary embolism. Even things like colitis and allergies. Another pulmonary embolism. So that's that date. And it just keeps going. He was receiving these emails knowing that people were being seriously injured and dying and having strokes. Yet it was being told to us that it was safe and effective. Page five, he has the word "concerning."

**Gayle Karding**
So just to back up. The response to the June 14th to 18th email: that email was sent on June 18th at 6:14 p.m. And at the top of the page at 8:17 p.m. What was Dr. Strang's response on the top of page 3?

**Shelly Hipson**
"So we would have to acknowledge a single case, but with few details due to privacy."
Gayle Karding
Okay. And then on that particular date, they were reporting six allergic reactions. Five they considered non-serious, but including pericarditis, tachycardia; five serious, hospitalized, including a bilateral pulmonary embolism, seizure and stroke in the same person. And on that particular date, no deaths were reported.

Shelly Hipson
Right.

Gayle Karding
And then on the next page, page five, that report covered—Well, it’s in a slightly different format. But on July 12th, Noella sends an email to Dr. Whynot. “We have several myocarditis, pericarditis reports that we received today. This is the first one.” And following the email thread up, what was Dr. Strang’s response on page five?

Shelly Hipson
Just, “Concerning.”

Gayle Karding
This is all in June and July of 2021. And the mandate and the vax pass were brought in in the fall of 2021.

Shelly Hipson
That’s right.

Gayle Karding
There’s several more pages of this. But, as interesting as it all is, I think we should fast-forward. And we will make electronic copies of these available to the commissioners. I’ll speak to whoever might be able to put them on the web as well. What’s the next one? You’ve got two or three minutes.

Shelly Hipson
Okay. I just want to highlight in 2022-1408, that they are not counting any of the deaths after 30 days. We can see sort of a criteria that they have to follow. The criteria are very tight: localized events, seven days; allergic events, 48 hours; neurological events, 56 days. What I’ve noticed in the reply to my Freedom of Information request is that there are no adverse events being recorded after one month. So I don’t know what people are seeing in their community, but I certainly have concerns of what’s happening in mine. And it may take a little bit longer for blood clots to manifest into death. And they are not recording anything after one month.
Gayle Karding
Okay. I don’t know how you feel about making the last one that we discuss, the comparison of the more recent hospitalizations for COVID? I think that's the one in your red folder at the back, but I'm not—

Shelly Hipson
I think it is, yeah. 161.

Gayle Karding
Yes. NSHA 2022-161.

Shelly Hipson
So, if we pull out that— We've gone from basically zeros. Did I did write on my copy, did I write it on your copy?

Gayle Karding
Probably. I've got lots of notes.

Gayle Karding
Five thousand, nine hundred, seventy-two.

Shelly Hipson
Five thousand, nine hundred and seventy-two general admissions for COVID.

Gayle Karding
Over what period?

Shelly Hipson
From—it's just January to October 2022. So, we've gone from nothing, zeros, to a substantial increase to general hospitalizations that are happening.

Gayle Karding
Specifically for COVID.

Shelly Hipson
Specifically for COVID.

Gayle Karding
As attributed by the government.

Shelly Hipson
Yes.
Gayle Karding
Are there any other ones, any last thing you want to include in there before we close?

Shelly Hipson
The exemptions, I just wanted to touch on that. The Public Service Commission did the exemptions for their government employees: 76 people applied for an exemption; 67 of those were declined. And I was quite surprised that the criteria for the exemption came from the Nova Scotia Public Service Commission and the Nova Scotia Department of Justice. They were the ones that created the exemptions for people, which was very hard to get an exemption.

The other thing that I just want to mention briefly is in the Adverse Events Following Immunization for the year 2022. On page 4, at the bottom, “a category of adverse events following immunization labeled other serious or unexpected events are not shown but are relatively frequent. These primarily include reoccurring conditions, gout, and cancer.”

They have actually acknowledged reoccurring cancer in a government document—in January 2022.

Which just leads me to Statistics Canada saying that the third week of January 2022 was the deadliest week in Canada since the pandemic began, with 27 per cent more deaths than would be expected. Recently we’ve had an article in the CBC: “Nova Scotia tight-lipped about the spike in deaths. Unexpected high numbers of people are dying in an untimely fashion.”

Gayle Karding
Thank you very much.

Shelly Hipson
Thank you.

Commissioner DiGregorio
Don’t go away yet, I have a question.

Gayle Karding
Oh, sorry, questions. Ms. Hipson, the commissioners may have questions.

Shelly Hipson
Yes, sorry.

Commissioner DiGregorio
Is this on? Can you hear me? Oh, there we go. Thank you for that. I have a couple of questions around the Freedom of Information process. Did you experience any issues in having your requests granted?
Shelly Hipson
It's been unreal. I had to be so determined and patient. There were so many stumbling blocks. I would apply and they'd extend it for another 30 days. And then they'd say, "Oh, you know, 30 days, the extension, that's 60 days."

[00:45:00]

Then it’s going to cost you—this is one FOIPOP—it’s going to cost you $540. “It was an important one, so a few of us chipped in on it. And even when I paid the $540, they did not grant me the information. So it's been unreal, yes.

Commissioner DiGregorio
And how do you think they could improve that process?

Shelly Hipson
That’s a great question. Freedom of Information is not free. Ontario, I believe under their act, it’s more so than here in Nova Scotia. They have the liberty to put it as a stumbling block in your way. So, I would like to see it. If it’s true, Ontario can’t do that. So, I would like to see it. It’s our information. They are our public employees. None of this I should have had to go through Freedom of Information requests. It should have been given to us. And then we wouldn’t have been scared.

Commissioner Massie
I have a couple of questions. I’ll start with a medical one, maybe it’s out of your expertise. I noticed that many of the cases reported were sort of anaphylactic shock. Are you aware whether they make any distinction between anaphylactic to some drug or septic shock? Because septic shock can actually be induced by LPS, that have been shown recently to be a fairly present contaminant in the mRNA preparation.

Shelly Hipson
Yeah. Sadly, that is beyond my scope.

Commissioner Massie
They haven’t made the distinction?

Shelly Hipson
No, I’ve never seen it in my information.

Commissioner Massie
My other question is—This is a very thorough work you’ve done. Your dedication is impressive. If you would now synthesize the message that you can gather from all of the data from the government site and contrast that with the message on the government site, what would be your appreciation?
Shelly Hipson
I think what I’m hearing you say is: Compare what I know and what they’ve told us from
this?

I think it’s sad that they didn’t provide the context and they created so much fear. With the
fear, people went out and got vaccinated for something that, based on my numbers, has a
99.5 per cent recovery. That troubles me: that we have those types of people that would do
that to us in our government. It troubles me to see that nobody was in ICU and yet in the
media line, it felt like we were just being totally overwhelmed, that the hospitals were
overwhelmed, the schools were, you know.

In my mind, I cannot fathom why anybody would want to do that to people. It troubles me
that that's who we have in leadership positions.

Commissioner Massie
Maybe one last question. The pandemic is a global event, so you would expect that you
would have similar numbers across provinces in Canada or the States or other countries.
When I look at the numbers you have compiled for Nova Scotia, by and large, that seems to
be fairly low compared to what we’ve seen from other places. Do you think that there’s
something special about the people in Nova Scotia or the way the pandemic has been
running in the province?

Shelly Hipson
With media lines that they used across the country, I bet if you went to every province and
did exactly what I did, you’d be quite surprised. I feel that it would expose the truth. I do
feel that we’ve been bamboozled into thinking that something was really deadly. And I
don’t think that happened.

I think it was like when you look at even the deceased case, and it can be probable and from
a clinically compatible illness—

[00:50:00]
I mean, to a coronavirus? And they’re including that in a count. It’s pretty easy to get those
numbers up, right? People in long-term care, sadly, when they die, they do fill up with
mucus. To swab that? Okay, you’ve got the symptoms of COVID.

And here in Nova Scotia, 83 is the median age of somebody dying of COVID-19 in the
province. The life expectancy in Nova Scotia is 80.

Thank you for your questions.

Commissioner Massie
Thank you.

Commissioner Drysdale
You talked a fair bit about ICU beds in the province. I have a couple of questions. One is: Did
you also ask about the ICU bed staffing? Because it’s one thing to say you have a bed and it’s
another thing to have a staffed bed.
Shelly Hipson
That’s a great question. And I did. I asked for the number of beds that were staffed over the last two or three—2019, 2020, and I believe it’s for 2021. And there are around 3,100 staffed beds. And I didn’t see a decrease. Now, that might be happening in 2022.

I did do another Freedom of Information asking how many people were no longer working or who were out on COVID. And that seems to be growing. So yes, that’s a great question.

Commissioner Drysdale
My next question again has to do with ICU beds. I thought I heard that you were looking at stats prior to 2019, and so my question is: Did you look at ICU bed numbers in the province, say from four or five years ago, and then try to see what the trend was? Whether the ICU beds in the province prior to the pandemic were increasing or decreasing or staying the same?

Shelly Hipson
That’s what this beauty chart is here, the first one. As far as the beds are concerned, they’re staying about the same. As far as the ICUs, hospitalizations particularly with COVID: I think they could be seeing a bit of a problem. There is another fold in there with the ICU beds and it looks to me like they’ve tripled for COVID ICUs.

Commissioner Drysdale
One last question because I know we are short on time. This is more or less based on the testimony we had earlier from Dr. Phillips. You talked about a number of adverse reactions, and you did a FOIA request on that. Do you have any information as to how many of those adverse reactions were actually reported into the CAEFISS system?

Shelly Hipson
No, not into that system, I don’t. I see where I’ve done Freedom of Information requests and I’m seeing a change in those numbers. They’re decreasing, they’re not increasing. So, I do question how much cleaning of the data they may be doing. I don’t think they’re all getting in there. And when I start to see the emails and the number of strokes and things that are happening and then I see the serious adverse events, the number should be much higher. There’s something going on there in my opinion.

Commissioner Drysdale
Thank you.

Commissioner Kaikkonen
Thank you for your presentation. I just have one quick question. Given that the chief medical officers across the country had the same messaging for communications to the populace, I’m just wondering why there were different mandates and measures put in place from Nova Scotia to other provinces within Canada? Did any of the Freedom of Information requests actually give any evidence as to why that would be happening?

Thank you.
Shelly Hipson
No, the media lines that I received were primarily dealing with reactions to the vaccine. So, they were specific to that.

Commissioner Kaikkonen
Thank you.

Shelly Hipson
You’re welcome.

Gayle Karding
Okay, thank you, Ms. Hipson.

[00:54:56]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website: https://nationalcitizensinquiry.ca/about-these-transcripts/
Ches Crosbie
Dr. Bate, thank you for appearing here. I’m going to ask you to affirm that you intend to tell the truth, the whole truth, and nothing but the truth.

Dr. Stephen Bate
I do.

Gayle Karding
Thank you. Good afternoon, Dr. Bate.

Dr. Stephen Bate
Good afternoon.

Gayle Karding
I’m one of the Atlantic Council on the NCI team. Can you just very briefly walk us through your credentials?

Dr. Stephen Bate
Okay, I’m a retired dentist graduated with a Bachelor of Science in Chemistry from the University of Western Ontario in 1986 and in dentistry, Doctor of Dental Surgery, in 1991. I practiced privately in Concord, Ontario from 1991 to 2013. I’ve since retired due to injuries in my shoulders and have moved to Newfoundland in 2017.

Gayle Karding
And I understand that your university education was heavily weighted in the math direction, is that right?
Dr. Stephen Bate
Yes, in fact I didn’t pursue a degree in mathematics—but I took all of my elective courses, while pursuing a BSc in chemistry, in math and physics.

Gayle Karding
And you have a special interest in statistics and data analysis.

Dr. Stephen Bate
I do, yes. I’ve got a keen interest in it.

Gayle Karding
Do you apply that interest in a number of areas?

Dr. Stephen Bate
Yes, for many years, I was doing stock analyses personally and I have always been interested in sports analysis. But the last few years since the breakthrough cases, when they occurred, it piqued my curiosity. Because being in the medical field, I always believed that vaccines would stop transmission to a great degree—if not some degree. But when I started hearing about breakthrough cases, I did send an email to our health officer Dr. John Hage outlining my concerns. I knew people were saying, “Why am I getting this disease? I got vaccinated.”

I received a response basically saying that the government was tracking breakthrough cases. They weren’t going to be producing any evidence or any numbers for the population, but national surveillance was being done. Which kind of shocked me.

Gayle Karding
You had an opportunity to apply your math skills and data analysis skills to two discrete areas that we want to talk about today. The first being the Pfizer document, the document released by Pfizer—or I suppose, more accurately released by the Department of the FDA [Food and Drug Administration]—after that order by the judge in January 2022. Is that right?

Dr. Stephen Bate
Correct.

Gayle Karding
What is that document? I think we have a copy to put up.

Dr. Stephen Bate
Yeah, it’s the adverse events that Dr. McCullough referenced earlier. I pulled this up last year and looked at it. And was rather shocked, to say the least, that a lot of it was redacted at the time. It got re-released a month later.
When I went to look at it again, I couldn’t find it, because it was originally released to March 1st, then they moved it to April 1st. So it got harder to find. But when I did this, what I discovered was that there were about 42,000 participants in their clinical trials. They were monitored from December 14th to the end of February of—I guess—2019 to 2020. And 42,086 had side effects, numbering nearly 160,000 side effects. The average person had almost four.

They reported that out of the 42,000 individuals that Dr. McCullough referenced, 1,223 resulted in fatal results; 9,400 of the outcomes were unknown. Which is astonishing.

**Gayle Karding**
Well, what does that mean, “unknown?” Or what would you think that means?

**Dr. Stephen Bate**
Well, they didn’t report. And then my personal understanding is people that die don’t report. I can’t say they all died but, how they got lost in the system, I don’t know.

Further to that point, if I can just move to the next slide: this is in the same report. They spoke of the pregnancies that were involved, the mothers they followed. There were 270 pregnancies. In the end, they only were able to—Two hundred and thirty-eight they did not follow, they got lost. Thirty-two they followed. Only one had a normal outcome of a live birth.

I’ll move on. Further in this report, they categorized by physiological—what was the cause, basically. They broke them down into cardiovascular, neurological, all the different possible categories of this. And just to show you one here for cardiovascular: they state in the relevant event outcomes. Fatal was 136. And the conclusion, which is too small for me to read here, but I believe it says, “The cumulative data indicates no safety concerns.”

[00:05:00]
And surveillance will continue.”

**Gayle Karding**
That’s at the bottom of that slide there. Let’s just review here. “Conclusion: this cumulative case review does not raise new safety concerns, surveillance will continue.”

**Dr. Stephen Bate**
Correct. And just to illustrate that that was not an isolated incident, the very next one is people that got COVID either through transmission or possibly from the vaccines, the same thing happened here: 136 fatal conclusions. “This cumulative case review does not raise new safety issues. Surveillance will continue.”

So that’s Pfizer’s own data that they tried to hide for 75 years. I think I know why.

**Gayle Karding**
When you say tried to hide for 75 years, can you just tell us what you mean by that?
**Dr. Stephen Bate**

Well, they were asked to report and give their data, and they refused to. There was a doctor in the States who—I can't think of his name offhand—but he had to spend a lot of time and money to go to the Supreme Court in various jurisdictions to get a judge to finally say, "Yes, you need to release that data."

**Gayle Karding**

Okay. What's the next page that we're looking at here?

**Dr. Stephen Bate**

We're looking now at Canada.

**Gayle Karding**

So sorry—we're moving on from the Pfizer trial.

**Dr. Stephen Bate**

I'm just looking at safety issues here in Canada. So that's just from the manufacturer. In Canada, it was reported January 8th of 2021, so it was the second week of reporting. This is what they reported: that there had been 10 serious adverse events reported and 338,423 doses administered, for an overall incidence of 0.003 per cent who were serious.

And now I move to the next one. As time went on, they made provisions to update the data. As more events occurred, they could re-establish what the numbers were from previous reports. Down the road, this would be December 9th, 2022: that very week they'd reported previously suddenly had 31 serious outcomes and 256,000 doses were no longer in arms. They only had 82,500 doses administered.

**Gayle Karding**

So sorry, what is the contrast you are pointing out here?

**Dr. Stephen Bate**

Well, basically, they—After a year and 44 weeks, they decided to then update the data. They'd been doing it progressively throughout the time. But at that point in time, the number of serious adverse events tripled, and the number of doses that they claimed were given went down by a factor of four. So tripled the serious adverse events, one-quarter the number of doses given; 12-fold increase in the serious adverse events were actually observed early on in the vaccination program.

**Gayle Karding**

And where did you obtain this data?

**Dr. Stephen Bate**

This is all from healthinfobasecanda.ca. You look for vaccination safety data, it's all there.
Gayle Karding
Is this still there?

Dr. Stephen Bate
I’m not sure. I actually got this from a third party who sent this to me. I had some of this data and she sent this to me in an email just a few days ago, so I’m not 100 per cent sure.

Gayle Karding
Whether it is still accessible.

Dr. Stephen Bate
I’m not sure. I think it is, but again, it gets changed all the time.

So really noteworthy, if I can just move on to the next here, is: this is a slide showing—The numbers in pink and the yellow outline are what the data was for these first six reports of 2021. And the ones that are just in the purple are what they had reported. So you can see that there’s—The 338,000 original doses and 10 adverse events became 31 and 82,000. As time goes on, the doses became more true or accurate. But you can see even in May of 2021, where they had originally reported 1,262 serious adverse events, it was actually 2,234 now being attributed to that time frame.

Gayle Karding
What, if anything, do you make of that?

Dr. Stephen Bate
If I could just continue, there’s an explanation forthwith. So basically, back early on—this is April 15th, 2022—as the numbers started climbing, they had 128 Guillain-Barré syndrome attributed side effects, and myocarditis/pericarditis were 2,044. And this again is from a third party. I didn’t write the red things in here, so you can try to ignore those.

Then in May of 2022 they reclassified these based on the Brighton Collaboration Index. And they grade these things in different levels—1 to 4. Suddenly they have two classifications for each of these. And then they decided later on in May to go back to 1, and they dismissed 120 Guillain-Barré syndromes. And a thousand myocarditis/pericarditis were then no longer attributed to this. So I believe, as they went back and increased the numbers from the previous ones that were not reported, they then removed these, so that the total numbers continually went up just a little bit week to week.

A bit of sleight of hand, I’d say.

I’m going to move on to effectiveness now. I just want to go through a series of these just to show these are screenshots that I took from the same healthinfobase.canada.ca. You may be familiar with these. They used to categorize these as such: unvaccinated cases not yet protected, partially vaccinated, fully vaccinated, and fully vaccinated with additional dose.
I’ve got this from May 8th, 2022. I then got June 5th, 2022. July 3rd, July 31st, August 28th, and September 25th. Now, in each of these publications—

**Gayle Karding**

Sorry, are we going to go back and look at those and you’re going to walk us through those charts?

**Dr. Stephen Bate**

I’ve got all the data on this hand thing I did, right? So those numbers are all here, but I’m going to summarize them shortly. For instance, May 9th to June 5th, unvaccinated cases were four times more likely to be hospitalized, five times more likely to die from their illness—which I would only assume would be per case, based on a per centage of cases—compared to fully vaccinated cases. During the same four-week period, unvaccinated cases were four times more likely to be hospitalized, six times more likely to die from their illness compared to cases fully vaccinated with one or more additional doses.

I’m just going to go quickly through these. They’re the same; there’s five of these. And again, these are only here because I screenshotted them. That data is no longer there. There’s a few of them that are there but if you go back, they only go back to April of 2022. And half of the dates, if not more, have no data whatsoever. In fact, if you go back to the very first one, I think it’s April 10th or something, if you click on that one, it has the September 25th—in the future—data on it! It’s absolutely nonsensical.

But I’d really like to highlight one here. It’s August 1st to August 28th. These are some pretty big numbers. They claim that unvaccinated cases were five times more likely to be hospitalized and seven times more likely to die from their illness compared to cases with a completed primary vaccine series. During the same four-week period, unvaccinated cases were four times more likely to be hospitalized, and eight times more likely to die from their illness compared to cases with a completed primary vaccine series and one or more additional doses.

So I did this. This is my work. I’m old school. My dad taught me early in my life that if I wanted to remember things, you write it down. You don’t just look at a screen or type it in. It doesn’t stay. I’ve been doing for a couple years now. I’ve got five books of this graph paper that I’ve been doing analysis of various things COVID-related on. This is a summary of those numbers for everything that I showed you there. Hospitalization rates are given and death rates for the periods. I really want to isolate on this August data. And the last three reports are very, I’d say, very damning to the vaccinated. I’m going to look at death rates individually here. For July 3rd to 31st, the death rate in the unvaccinated was 1.09 per cent. In the fully vaccinated plus one dose, it was 0.94. With two doses, it was 1.95. For those with any vaccinations whatsoever, fully vaccinated—they stopped doing the partial ones—1.23 per cent.

So now, in August, these numbers become a little more scary. The unvaccinated is: 1.36 per cent of cases resulted in death. The fully vaccinated with boosters: 1.90. They claimed that you’re eight times more likely to die if you’re unvaccinated from your case than if you’d had a booster dose or more. And in fact, those people were dying at about a 40 per cent higher rate. Not lower by eight factors, higher by 40 per cent. And the same holds true in the September data as well.
I just want to point out quickly—I do believe I have it here. This is the World Odometer, yesterday’s data. I believe the number of deaths attributed in Canada so far is 51,000 some-odd, out of slightly over 4 million cases reported, for an overall mortality rate of 1.12 per cent. So 1.12 per cent. If we look at the fully vaccinated with one or more doses and two or more doses, those numbers for the last two months are basically double what they’ve been for the entire duration of the pandemic, with a less mortality variant in play, apparently. These are rates, not numbers.

So how is it that twice as many people that are diagnosed are dying than throughout the entire pandemic? That is what I can’t quite comprehend.

Gayle Karding
Okay, does that conclude your prepared statements?

Dr. Stephen Bate
Not quite, no.

[00:15:00]

I just want to point this out as well. So these are basically the same things I looked at: What they claimed the percentage, or the factor of hospitalization and deaths were compared to what the actual numbers that they published in the same report actually were. And you can see from the bottom three here: basically, hospitalization rates were lower in the unvaccinated. The death rates in particular were much lower in the unvaccinated population than those receiving fully vaccinated, plus one or plus two booster doses.

Further to this, I want to talk a little bit about the vaccination coverage that’s been reported. And this is the most up to date. This is from Canada.ca. And I just want to look at the one here saying, “total population that has received at least one dose,” is stated at 80.7 per cent. And then if we go to the same place you go to access this, you click on a different button. You can get the health info-based number and this one says at least one dose, 83.4 per cent.

And that is a 3 per cent of the population difference. It’s the same people doing the data, I believe. Somehow, they report two different numbers. It boggles my mind a little bit, to quote John Campbell on that. But I do find that astonishing, that the same people report different numbers from the same webpage.

And I just want to quickly point out from the previous speaker—and I thank her for her diligent work. I think it’s noteworthy, when we look at respiratory illnesses that result in all these problems and lockdowns and mandates and so forth, if we look historically—And this is hard to find, I looked it up just a couple months ago, and I thought last night, because I’m a fast talker I might be able to slip this in too, but I looked at data for the influenza virus. And in the USA in 2019-2020, there were 36 million cases confirmed. And in the 2020-2021 flu season, there’s no data. They said it was too little to find. And I did find one reference and the number was 1,675. This represents a 99.995 per cent reduction in influenza cases confirmed in the United States. Infer what you will. In Canada those numbers went from 55,379 to 69 the following year.

Say what you like, it seems something may have got renamed. But at the end of the day, there were more COVID cases reported than flu cases previously. So how did that happen?
I’d like to point out one thing—With my bit of a mathematical mind, I looked into the cycle thresholds that were being run on PCR tests in Newfoundland and Labrador, where I’m from. They’re running at 45. Now, I know Dr. Carey Mullis, who developed the PCR test, stated that anything above about 26 cycle thresholds was meaningless because there’s too many false positives.

To put into perspective: I did a little math. And if you have a loonie in your hand, your loonie is worth one dollar. And if you ran that at 45 cycle thresholds—which is to multiply it by two 45 times; it’s an effort of magnification—it comes out to over $31 trillion dollars. To put that into a more visual perspective, that one loonie weighs seven grams.

If you took seven grams and multiplied that by 245 times, you’d have the mass of enough Titanics to lay end-to-end for 1,200 kilometers.

So if you want to bump up some numbers, run 45 cycle thresholds. No problem. Done.

There’s one more comment I’d like to make. In Newfoundland and Labrador, they’ve been doing pie charts. They’ve stopped. Everyone I’ve talked to pointed out their discrepancies. They have ceased to report vaccination status data. But in Newfoundland and Labrador, all told, I think we’ve had 300 or 400 deaths. I haven’t looked at it recently. They haven’t reported it recently, so I don’t know. But I know that between May 11th and June 8th of 2022, there were 11 deaths reported. And they used to do daily updates and say how many cases were from which area, which age groups, and so forth. They noted in that release on June 8th of 2022 that, of the 11 deaths, very sadly and tragically, one had occurred—our first death in the under 20 age group. And at the same time, another one was reported in the 30 to 39 age group.

[00:20:00]

And to this date, they are still the only two under the age of 40. All 11 deaths that week were fully vaccinated. So not a single unvaccinated person under the age of 40 has died in Newfoundland and Labrador attributed to COVID during the entire pandemic.

Gayle Karding
Thank you very much for your presentation, Dr. Bate. I’ll defer to the commissioners for questions.

Commissioner Massie
Thank you for your presentation. I’ve seen some analysis of the government website in terms of the number they were coming up with respect to the likelihood of getting hospitalized or dying.

I’d like you to comment on what kind of data representation you could actually come up with in order to generate these kinds of conclusions, given that the numbers you’ve calculated are completely different.

Dr. Stephen Bate
Well, it’s speculation. I don’t want to say they’re lying necessarily, but it seems to be a form of coercion that, “If you don’t get the vaccine, you’re probably going to die.” We’ve seen it through the media throughout—especially in the States. You know, “If you don’t get it, it’s
going to be a painful, terrible winter," and all this sort of thing. I also know personally that
in Newfoundland and Labrador, they've reported for almost a year now that 100 per cent of
the over-70 population is fully vaccinated. Personally, I know about 20 people in two small
towns, totaling about 14,000 people: Clover Town and Gander. I have a list of 21 people
over the age of 70 that are unvaccinated. And for this to be true, for the 100 per cent to be
not 99.9, there could only be 31 in the whole province.

Commissioner Massie
Do you want to ask a question? All right. Thank you. Thank you very much.

[00:22:27]
Ches Crosbie
Welcome. Do you swear to tell the truth, the whole truth, and nothing but the truth?

Vonnie Allen
I sure do.

Ches Crosbie
Thank you.

Vonnie Allen
My name is Vonnie Allen. I was born and raised in Amherst, Nova Scotia. I left Amherst and moved to Moncton, New Brunswick, only long enough to get my RN diploma and begin my nursing career. In April of 1987, I moved back to Amherst with my then-husband and began working at Highland View Regional Hospital. In February of 1988, upon returning from my two-and-a-half-month maternity leave, I was given casual employment on the maternity unit. Little did I know that maternity is where I was meant to be and that I would develop a passion for it that would last almost 34 years—until I was unceremoniously put on unpaid leave on December 1, 2021 for standing up for my rights and declining to take an experimental medication.

I am the proud mother of four adult children and the blessed nanny of three little boys. Only one of my children has been awake and supportive of me throughout this three-year ordeal. Unfortunately, the oldest three have believed the mainstream media and the government and have been made unreasonably fearful like so many others. Two of them have forbidden me to speak of anything related to COVID and the mandates. I have been muzzled and disallowed to talk of the impacts that the COVID mandates have had on my life: The loss of my career, the loss of my income, the loss of respect from much of my community, the refusal of EI to give back any of what I paid in for over 35 years, the seven months I lived with no income except what I could borrow from friends and family and an RRSP I was forced to cash in, the inability to step foot in my local bowling alley for five
months, a place I called my second home for over 40 years, and the denial of entrance to my own local hospital when my youngest daughter had a grand mal seizure last year and had to be rushed in by ambulance.

She didn’t know her own name. She couldn’t speak. She was totally incapable of advocating for herself. She was terrified. And I, her mother, a formerly respected veteran nurse of that very hospital, a hero just two years earlier, was not allowed past the front door because I was not vaccinated with an unproven experimental drug.

I was married to my children’s father for 29 years, spent 36 and a half years with him total. He was emotionally abusive, an angry man, and he worked when he felt like it. So for all but two years of our marriage, I was the major breadwinner. For two years, he worked up north in Baker Lake, Nunavut, and made great money. But then he quit and felt that because he had missed so much while he’d spent many months away, he was entitled to a year off. So the bills piled up. I tell you this because for my entire marriage, I lived paycheck to paycheck, robbing Peter to pay Paul. Which credit card should I put money toward this pay?

When I left him in 2016, I took on all of our accumulated debt, $55,000, in return for him not demanding spousal support. I got a consumer proposal, and I paid off our debt as well as my vehicle. Times were still tough for me for a few years. But then they were both paid off, and for the first time in my life, I had money. I could buy groceries without worrying. I could give money to my kids when they needed it. I could give them each $200 or $300 at Christmas time to help them out. I could go on vacation or rent a cottage in the summer, and I could actually save money. Life was good.

Fast forward to 2021. I started to hear grumblings that I might lose my job if I didn’t comply with the vaccine mandate. My unit was so short-staffed that overtime was readily available. I started picking up overtime shifts in an effort to build a nest egg just in case I should lose my job.

But I didn’t really believe that was going to happen. Surely to goodness, during the worst nursing shortage in history, someone would come to their senses, and the most senior, most knowledgeable, most experienced nurse in the obstetrical department would not be put off work.

But that is exactly what happened. I went to work on December the 1st and was told by Director of Health Services, Lisa Lynch, that I had to leave. And being denied EI, my little nest egg didn’t last long. My employer told EI that I left voluntarily with no just cause. It didn’t seem too voluntary to me. In March of 2022, I was forced to put in for retirement, and I’d had no intention of retiring in the immediate future. I loved my job. I didn’t receive a check until June. Fortunately for me, they backdated my retirement to December the 1st. Unfortunately, my ex-husband got 45 per cent of my pension. So once again, after paying back all the people I owed, I was soon back to living paycheck to paycheck—and through no fault of my own. I had done nothing wrong.

In 35 years, I had never been disciplined or reprimanded. I had only stood up for my rights, and not in a hateful, malicious way. I had simply declined to put into my body what I felt was not a safe or necessary chemical. And anyone who really knows me knows that I have avoided chemicals as much as possible for many years. So this wasn’t a new radical stance for me. It was totally in keeping with my natural lifestyle.
I was devastated to lose my job. I loved nursing. My dad used to tell me that when I was a little girl, I always wanted to be a nurse and a mother. So I was a happy woman. Caring for obstetrical patients in labour and delivery, teaching breastfeeding to countless women, caring for them postpartum was my passion—and I was damn good at it. Just ask the women of Cumberland County and surrounding areas who have delivered a child in Amherst since February of 1988, and they will confirm that. To this day, I meet women of all ages in all settings who tell me that I was there when they had their child and that they have never forgotten me.

Obstetrical nurses have a huge impact on women’s lives, as well as their families’ lives, and I was very fortunate because our unit looked after off-service patients and pediatric patients as well. Heart attack patients from ICU, awaiting cardiac catheterizations, surgical patients, medical patients, gynecological patients, palliative patients—we got them all. And I was always thankful for that because it kept me learning and enabled me to keep my hand in all aspects of nursing to some degree. And it allowed me the privilege of caring for men and women of all ages. So nursing was my passion, and though I had done nothing wrong, I was no longer allowed to do it.

And that brings me to my co-workers. How I loved my co-workers. And I can safely say that the majority of them loved me, and they depended on me. They looked to me to answer their questions and show them how to do things. They came to me to start IVs because I was the expert. They came to me for advice because I was the only one on my unit with 35 years of knowledge and experience. I hadn’t seen it all, but I had seen and been involved in most of it.

Labour and delivery nursing involves looking after two patients, and one of them can’t be seen. It’s an art, a talent, a gut feeling, a skill, and it’s not a skill that one develops overnight. It requires knowledge, but it also requires experience. You can read about all the obstetrical emergencies in a book and take a course and ace the exam. But nothing can replace living through those emergencies firsthand and learning how to deal with them to come out on the other side with a live mother and a live baby who are both fully functional. And sometimes, regardless of what you do, you lose a baby. I have experienced that firsthand with my first pregnancy culminating in a stillbirth. So I was always drawn to those mothers who suffered a similar loss. I felt I had something to share with them, and Lord knows that no one else was jumping up and down to look after them.

[00:10:00]

In my almost 34 years in obstetrics, I had dealt with most obstetrical emergencies, both as a patient and as a nurse. So I was not just a valued and loved co-worker. I was their mentor—their only mentor.

The next person in line to me had about five years’ experience. One co-worker had worked in obstetrics with me many years before but had actually left nursing altogether for several years. So upon returning, she had forgotten a lot of what she had known and had also lost her confidence. And confidence is important. Knowing what you know. Not being cocky, but confident. It is knowledge and confidence that allows you to stand up: To stand up for your patients and be their advocate. To stand up to the doctors when you don’t agree with their approach or treatment. To stand up for yourself and your co-workers when management is putting you and them into unsafe working situations. And I did that for my patients and my co-workers. I stood up for them. And I stood up for myself, which is why I don’t have a career anymore.
Thank you.

Gayle Karding
Thank you, Ms. Allen. I’m going to follow up with some questions. I think you’ve touched on everything that I could think of for your personal situation, and you’ve described in a very heartfelt way the impact on you personally. I do want to spend some time with you since you spent so long in the Cumberland region practicing nursing. I wanted to talk to you generally about the health care system there in and around the time of the pandemic.

Vonnie Allen
Yeah.

Gayle Karding
You used the phrase in your evidence, “fully staffed,” and how infrequently the unit was fully staffed, and so there was lots of overtime available. What would a fully staffed unit look like?

Vonnie Allen
So full staffing on my unit was considered to be two RNs and one LPN around the clock. In the year before I left, full staffing was in place probably about 60 per cent of the time. Often, we were staffed with one RN and one LPN. If we were lucky, we had one RN and two LPNs.

Our LPNs were good. They were smart and capable, but their scope of practice had limitations. LPNs are not permitted to be the labour and delivery nurse. They could be the second nurse in the delivery room and look after the baby when it was born, and they could initiate a resuscitation if it was necessary. But if there was only one RN on, it meant that if there was a patient in labour, she had to be one-on-one with that patient. It meant she had no one to relieve her for breaks and no one to look after a second labour patient if one came in. That was a scary scenario, one that you were always hoping would never occur.

And having only one RN put a lot of pressure on our LPNs. They were expected to look after the entire unit outside of the delivery room, plus come in to help the RN during the delivery. So if we couldn’t staff with two RNs, we always tried to have two LPNs with our one RN. More bodies was preferred. LPNs were more likely to pick up extra shifts if I was the RN on that shift. Because they had confidence in my knowledge and ability to keep my cool and handle whatever situation came up.

Gayle Karding
And when you were fully staffed, or at least had a full RN contingent, which would have been two of you on at once, you’ve said that you were often acting as a mentor to the other RN who was on.

Vonnie Allen
Oh, absolutely, yes, yeah.
Gayle Karding
And so, when you weren't there, presumably one of those less experienced were the only ones on. If there was only one.

Vonnie Allen
Yes. And they were put into terrifying situations. And the thought of being two or three, or four, years' experience, five years even, and not having anybody else for back up? It's terrifying.

Gayle Karding
My understanding from speaking with you earlier was that in the context of this short staffing from March to September, your obstetrics unit was actually closed.

[00:15:00]

Sorry, from March to September 2020, your obstetrics unit was closed.

Vonnie Allen
Yes.

Gayle Karding
What was the reason to the best of your knowledge for that closure?

Vonnie Allen
We were closed from March 27th to September of 2020. We were told it was because we were already so short-staffed that if any of us got COVID, the unit would end up shutting down anyway. So we were rerouted to other areas in the hospital, most often medical, but sometimes surgical or ICU or emerg., and during those five months bed occupancy was down drastically. There were no COVID cases in the hospital. There were very few patients in the hospital. Medical had 38 to 39 beds and they might have 20 beds occupied. The ER generally had very few patients during a shift. Often the nurses were sitting around behind the desk chatting because they had no patients. And the majority of patients on medical were patients with dementia, awaiting placement.

And I have to speak on their behalf. Here we were in our black and white uniforms with masks on. They were already confused. They could never get familiar with anyone because we all look generally the same. The mask muffled our voices and hid our facial expressions and kept them from reading our lips when most of them had some degree of deafness. I would often stand across the room from them, pull my mask down so that they could see that I was a human being, and talk to them in a raised voice so they could read my lips. It was a horrible way to treat people. They weren't permitted any visitors and they knew none of us.

I saw some amazing nurses go out of their way to try to enable these patients to FaceTime with their families or talk with them on the phone, but most of the patients struggled to understand what was going on.
Many of them died before they were ever placed in long-term care because the rules for getting into long-term care were ridiculous during COVID. If they became palliative, then they were permitted a family member—or sometimes two—but never at the same time. Imagine. It could be two people who lived together at home, but they weren’t allowed to visit their dying mother at the same time. Often by the time they were palliative, they no longer recognized their own family members because they hadn’t seen them for so long. The masks and the rules were a travesty to health care and particularly to this segment of our society. And during all that time we did plenty of testing, but we never had one case of COVID.

**Gayle Karding**
In the context of the government messaging about how unsafe an unvaccinated nurse would be to their patients, did you ever alert any of your patients to your status?

**Vonnie Allen**
Every one of them.

**Gayle Karding**
How did you do that? Tell us about that.

**Vonnie Allen**
I would just bring it up in conversation. I was led to believe by the occasional person—not many. My nursing co-workers were very supportive of me, unlike a lot of people that I hear of. But on occasion, I would hear grumblings that patients didn’t want to be looked after by nurses who weren’t vaccinated. So I made a point of telling them all that I had not been vaccinated against COVID.

I never once had a single patient respond in a negative way. I never had one of them ever ask to have another nurse. Now, at times that would have been difficult because I would have been the only RN. But there was never a patient that ever made me feel uncomfortable or like they felt like they were being looked after by somebody who had the plague.

**Gayle Karding**
Those are all my questions. I’ll defer to the panel for any questions.

**Commissioner Drysdale**
I have a couple of short questions. Were you the only one in your health community that was affected like this, that were let go?

**Vonnie Allen**
In my hospital, I was the only RN. There were two LPNs on the medical floor who didn’t take the vaccine and so lost their jobs.

[00:20:00]
I have no way of knowing how many other people in my hospital in other departments or how many other people in, say, nursing homes in the community didn't take the shot.

**Commissioner Drysdale**
It also said that the unit was closed down between March and December.

**Vonnie Allen**
March and September.

**Commissioner Drysdale**
September 2020. And the reason given was that if they lost one nurse, they couldn't operate.

**Vonnie Allen**
Yeah.

**Commissioner Drysdale**
So my question is, when they lost you, how did they operate?

**Vonnie Allen**
Well, I can tell you they're not a happy bunch. They were terrified when they started thinking that they might lose me. We would have staff meetings and one of the girls would say, "Why aren't we going to talk about the elephant in the room here? Like, what are we going to do if Vonnie has to leave? What are we going to do about this?" And our unit manager would respond by saying, "Well, you know, that's not really something that I have any information about. I can't really talk about that." And nobody was giving us any answers, and we just kept hoping beyond hope that it wouldn't happen. We had just started a new rotation recently and we were having a difficult time filling the spaces in that rotation. As I said, overtime was readily available. So they were wondering, "What are we going to do when we lose you too?" And not just another staff member, but the one with the most knowledge of anybody there.

One of my co-workers messaged me last week, and I actually sent the message to Gail. She said, "Vonnie I'm still grieving the loss of you from our unit." She said, "It's never been the same since you left. I feel like it was the beginning of the end for us." She said it's not a good place to work anymore. It's not safe and she said, "It's just not right, you know. We're missing you badly."

**Commissioner Drysdale**
Did you receive any comments, support, or anything from the rest of the staff—the doctors? You talked about the LPNs. You talked about the nurses. I didn’t hear you say the doctor word.
Vonnie Allen
Well, it's interesting. One of our obstetricians, I had a great deal of respect for her. She had a few more years' experience in obstetrics than I did, and she and I often disagreed on a lot of points. But we respected each other enough to agree to disagree. But when it started getting down to the end and I knew I was going to lose my job, she would approach me and say, "Vonnie, what are you going to do? Like, why don't you take the vaccine?" And I'd say, "No, I'm not taking the vaccine. I'm not sure what I'm going to do, but I'm not taking the vaccine." And "Well, aren't you worried?" "Well, yeah, I'm worried, you know?" And then she sent me a message one day on Messenger that said, "I've been hearing that you might not be able to get your pension. They might just pay it out in one lump sum. I'm really worried about you." And she said, "Aren't you worried?" And I responded and said, "Yeah, I am worried, but doesn't that seem a little bit Nazi to you?" Take this experimental drug that has no proven effectiveness and no safety record, or you're going to lose your job and you might lose your pension too. And she responded back by saying, "No, that doesn't sound Nazi to me. No one's leading you to the death camp. No one's taking you to the gas chambers." And then she went on this big tangent about how important it was to take it. Nobody said it was 100 per cent effective, but you need to take it to protect all those vulnerable people in society. That's the last time I ever messaged with her.

Commissioner Drysdale
Thank you.

Vonnie Allen
And as far as the other doctors on the unit, they didn't really have much to say. One of them is my family doctor, and I've always admired him.

[00:25:00]

But none of them stood up for me, basically. We had one doctor in the entire hospital who spoke out very, very candidly about the vaccines, about the lockdowns, the mandates, the masks. I don't know how he's still practicing. His Facebook page is covered on a daily basis with this stuff, and I'm thinking, how is he getting away with it? You know, he's still a doctor. He's the only one—the only one who spoke out against it.

There's one other thing I'd like to point out. When I left, I took with me a lot of knowledge and experience. And one of the areas that I can assure you is really suffering right now is breastfeeding. I never took the lactation consultant course. I started it when my children were very little, but I soon realized that my kids would only be little for so long and it took up far too much time. One of my co-workers, a friend and a co-worker for 28 years, she took the course. She went off sick in 2016 with cancer and never came back to work and ultimately died in 2020. But even during her years at work, she was team lead, so she spent much of her time at meetings and rarely had direct patient contact. So I became known as the breastfeeding guru.

I had breastfed my own four children and taken numerous courses over the years, and I had helped literally hundreds, if not thousands, of women breastfeed. As with maternity in general, I had a passion for it. The girls often called me "the boob whisperer." They said, "if Vonnie can't lactate that baby, no one can." I spent a lot of time teaching women to breastfeed and latching their babies. And some babies wouldn't latch. So I came up with plans to get their babies fed until we could latch them. I taught hand expression and pumping to moms as well as my co-workers. I hand expressed more women's breasts for colostrum than you
could ever imagine, because it’s something that women don’t come naturally. They don’t know how to do that naturally. I latched babies to moms who couldn’t keep their eyes open and held the babies there while their mothers slept. I spent countless hours with both inpatients and outpatients trying to resolve breastfeeding issues: latching problems, lack of supply problems, sore nipples, blocked ducts, oversupply problems, you name it. I was the solution-finder.

I had two colleagues—two of my LPN co-workers, who also had a passion for breastfeeding. And I was always so pleased if one of them was coming on after I’d spent my shift with a difficult breastfeeder. I knew that they would work just as hard as I had to try to help that woman have success. But they would usually come to me to confirm that what they were doing was right. We would discuss different tactics and ideas and brainstorm with each other. But I was the one with all of the years of knowledge and by far the most hands-on experience. So when I left, that was gone.

The fact that they could just do this to us. And this is supposed to be about our health, all of these mandates. But none of it has been good for anybody’s health.

If you have no more questions, I have one final thing to say. Once upon a time, I was a respected member of my community. I was a respected aunt, mother, sister-in-law, and friend. Because of the stance I took, because I declined to take an experimental drug with no science to back it, I lost my job and my credibility. I’ve lost the respect of my oldest children, a niece, many of my friends. My sister-in-law has blocked me. I have been discriminated against and denied entrance to restaurants, theaters, my bowling alley, my friend’s party. I was unable to go away on vacation with my four oldest girlfriends of over 40 years. I spent 35 years in a profession

[00:30:00]

where I helped and cared for other people, but now I am not allowed to speak because my opinion no longer matters.

I have been censored.

Gayle Karding
Thank you, Ms. Allen.

[00:30:35]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Ches Crosbie
The next witness is Leigh-Anne Coolen. Leigh-Anne, do you affirm solemnly to tell the truth, the whole truth, and nothing but the truth?

Leigh-Anne Coolen
Yes, I do.

Gayle Karding
Good afternoon, Ms. Coolen.

Leigh-Anne Coolen
Hi.

Gayle Karding
Can you tell us where you’re from?

Leigh-Anne Coolen
I’m originally from Newfoundland. I live now in Head of Jeddore.

Gayle Karding
Head of Jeddore, Nova Scotia?

Leigh-Anne Coolen
Yes.
Gayle Karding
I understand that you did take one dose of the vaccine?

Leigh-Anne Coolen
Yes.

Gayle Karding
And when did you do that?

Leigh-Anne Coolen
On May 27th, 2021.

Gayle Karding
Did you do that of your own accord?

Leigh-Anne Coolen
No.

Gayle Karding
And can you elaborate on that?

Leigh-Anne Coolen
My employer started, I guess, maybe March or April, with a real push for everyone to get vaccinated. I held off until I couldn’t any longer, and I had to go get my first shot. They expected two, but they got one.

Gayle Karding
Okay. What were your reasons for hesitating?

Leigh-Anne Coolen
Because it was too soon. Everything was just, “Oh, here’s a vaccine. It’ll help.” I didn’t trust that it would help. I’m not an anti-vaxxer by any means. I’m fully vaccinated. My son is fully vaccinated. My husband is vaccinated. I’m not against vaccines. I was just against this because I didn’t trust it.

Gayle Karding
When you say that family members in your household are fully vaccinated, you mean the kind of traditional vaccines, that sort of thing?

Leigh-Anne Coolen
Yes. Exactly, yes.
Gayle Karding
Okay. You started to feel some pressure in March and April from your employer.

Leigh-Anne Coolen
Yes.

Gayle Karding
Did your employer have a mandate in place?

Leigh-Anne Coolen
They did mandate it. I’m not sure if they had a written mandate. I’m sure it’s probably in the company policy in some way shape or form. I do have emails from the president, kind of telling everybody to go get vaccinated; remember, get your vaccination; send in your verification kind of thing when you’re done, so we can have that on file.

Gayle Karding
Were you ever told what would happen if you did not get vaccinated?

Leigh-Anne Coolen
We were told that we wouldn’t be able to work there anymore.

Gayle Karding
Okay. So in May of 2021 you did receive your first injection. Do you know which one you got?

Leigh-Anne Coolen
It was Pfizer.

Gayle Karding
Pfizer, okay. And do you know where you got that and who administered it?

Leigh-Anne Coolen
I don’t know who administered it, but I do I know where I got it. It was at the pharmacy in the Superstore on Cole Harbor Road.

Gayle Karding
In the pharmacy. And do you have the lot number for that?

Leigh-Anne Coolen
I do, but I don’t have it with me. I know I filled it out on something, but I—
Gayle Karding
Alright, so you got one injection of Pfizer in May of 2021. And tell us what happened after that.

Leigh-Anne Coolen
Everything seemed normal until Sunday, June 20th, when I don’t remember much. I remember waking up in the morning and hearing my husband talking to, I assume, somebody on the phone. Because it was only him and I in the room.

It was the paramedics. I had a stroke. The ambulance came and, the next thing I knew, I had paramedics at the foot of my bed. They took me to the hospital, and I was there for five days.

Gayle Karding
Has your husband described that experience to you?

Leigh-Anne Coolen
He has. Not in great detail, because he’s still traumatized from the event. I make noises in my sleep. He wakes up immediately thinking, “what’s going on here?” So yeah, he still lives with it.

Gayle Karding
And what did he tell you about the experience?

Leigh-Anne Coolen
I don’t even know how to put it into words. He said my face was kind of twisted, obviously. Because I had a droop on one side of my face. I was trying to say words. He couldn’t understand anything. I wasn’t there, so I don’t know, but he doesn’t really elaborate on it because he doesn’t talk about things like that.

Gayle Karding
Okay. The five days that you were in the hospital, can you describe how you were feeling, some of the symptoms you were having?

Leigh-Anne Coolen
I don’t remember any symptoms at all, really. It kind of just happened, and it went away. I’m left with memory loss, or I don’t know what to call it. I can’t get my thoughts organized as quickly as I used to be able to. But I went through several tests in the hospital, several CAT scans, everything. I had blood work done, I think, twice a day.

[00:05:00]

I had an IV with a heparin drip because of the blood clots. The blood clots were in my arteries, not in my veins. I do have Factor V Leiden, but it is actually in my report from the hospital that they don’t believe that was the cause of the stroke. Eith all the other tests that
I had done, nobody gave me a reason as to why this happened. So I’m still left wondering why.

**Gayle Karding**
Okay. When you were in the hospital, was there any discussion about whether you’d had your vaccine and when?

**Leigh-Anne Coolen**
No. Before I got out of the ambulance, they gave me a COVID test, because I wasn’t allowed in the hospital without one. I did mention to them at that point that I had just had my vaccine about three weeks ago. And nobody said anything. A couple of days later, I believe, when I was in the room and there were medical teams visiting, I had mentioned that I had had my vaccine about three weeks ago. And nobody paid any attention to those words coming out of my mouth. They kind of just turned around and walked away, and nobody said anything about it.

**Gayle Karding**
So during the entire time that you were in the hospital, no doctor or medical professional asked you any questions about the proximity of your stroke to your vaccine injection?

**Leigh-Anne Coolen**
None.

**Gayle Karding**
How old are you?

**Leigh-Anne Coolen**
Now I’m 42.

**Gayle Karding**
And at the time?

**Leigh-Anne Coolen**
Forty-one.

**Gayle Karding**
Forty-one years old. Is there any history of stroke in your family?

**Leigh-Anne Coolen**
There is. My grandmother, I believe she was in her 50s when she had a stroke. I think she also has—or had—factor 5 Leiden. She had blood clotting: I believe she had a blood clot in her leg. She did have a pulmonary embolism, a stroke. She had an aneurysm that was
clipped. It didn’t leak or anything, so they settled that. But she had the typical Factor V Leiden things happening.

Gayle Karding
Okay. Do you know whether her stroke was consistent with that condition?

Leigh-Anne Coolen
I can’t say one way or the other.

Gayle Karding
All right, and we have your discharge summary that we can put up on the screen. It’s one of the exhibits and—

No? Okay, I was given an exhibit number. If I could just have one moment, I’m going find that, indicating that you have this condition, this Factor V Leiden. And indicating specifically that it was not responsible for your stroke and that’s because your stroke was an arterial clot?

Leigh-Anne Coolen
Yes.

Gayle Karding
And Factor V Leiden is specifically responsible for intravenous clotting?

Leigh-Anne Coolen
Yes.

Gayle Karding
Okay. It’s at TR-003. I’m going pass up this copy to the panel because we were supposed to have that uploaded so that they can see that.

And I’m specifically referring, Commissioners, to the second paragraph, starting with the word “hematology.” Second paragraph on the first page. Hematology was consulted and the patient was started on a Heparin drip. It was felt that her Factor 5 Leiden mutation was not the cause of these arterial clots, as this is associated with Inktree’s venous clotting.

So the one pre-existing condition that you’re aware you had, they have ruled out as the cause.

Leigh-Anne Coolen
Yes.
Gayle Karding
And you're not aware of any other pre-existing conditions which would potentially cause you to have a stroke at 41-year-old?

Leigh-Anne Coolen
No, I'm not aware of anything.

Gayle Karding
In the context of that year, or the previous years, were you generally healthy?

Leigh-Anne Coolen
Yes.

Gayle Karding
Okay. What, if any, long-term impact have you felt this has had on you?

Leigh-Anne Coolen
It's like I don't know myself anymore. I know my thoughts and stuff. I can process thoughts, thoughts come quickly, I just can't organize them to get them out. Things that I enjoyed doing, I don't enjoy anymore.

[00:10:00]

I just— I don't know. I'm just — I'm just here. Like it's just all the drama with everything around the whole vaccinations and you can't talk about it and everything else. So just sweep it all under the rug. And it gets to you. Really.

Gayle Karding
Are you on any medication that you weren't on previously?

Leigh-Anne Coolen
I am. They prescribed atorvastatin for high cholesterol.

Gayle Karding
Okay.

Leigh-Anne Coolen
And vitamins: vitamin D, vitamin B12

Gayle Karding
Is that in relation to—?
Leigh-Anne Coolen  
That’s what they prescribed for me when I left the hospital.

Gayle Karding  
Okay. Do you have regular updates with your family doctor?

Leigh-Anne Coolen  
I don’t. I haven’t had a family doctor for quite some time I do have a nurse practitioner now. I do have to go and get some blood work done for an update.

Gayle Karding  
How often do you have to do that?

Leigh-Anne Coolen  
Nobody told me anything, so I guess it’s my own discretion.

Gayle Karding  
Did you ever have any conversations with her after your stroke?

Leigh-Anne Coolen  
After my stroke, I did talk with the nurse practitioner at that point. He was very supportive. He seemed like he kind of felt that maybe the vaccine did have something to do with it. That made me feel fantastic, because I’d never had anyone actually on my side before.

Now, I don’t have him any longer. He’s been replaced with another nurse practitioner. I did speak with her about it, but she’s not as vocal as he is about it. So I assume that she doesn’t want to talk about it.

Gayle Karding  
Are you aware of whether or not your first nurse practitioner—the male—reported the symptoms of your stroke to the vaccine injury database?

Leigh-Anne Coolen  
I’m not aware that he did.

Gayle Karding  
Did the mandates have any other impact on you? Actually, before I move on to that, I understand you did not have the second dose.

Leigh-Anne Coolen  
Correct.
Gayle Karding
What, if any, impact did that have on your employment?

Leigh-Anne Coolen
I had to leave my job because they kept at me about another vaccine or an exception letter. In a follow-up appointment I had with hematology, I asked the doctor on the phone, “Is there any way I can get an exemption letter? Because work is asking me to get the second vaccine.” She told me, if I was worried about having another stroke, to get my second vaccination before my fragment injections ran out, which was the prescription that they sent me home with from the hospital.

That’s when I gave up and I said, “I’m not going to get an exemption letter. I’m not having another vaccine, so I’ll just have to move on.” And that’s what I did. I quit that job in December 2021.

Gayle Karding
Did the rules and mandates, the vaxx pass, all that sort of stuff: Did that have any other impact on your life?

Leigh-Anne Coolen
Well, my husband got the second shot because we were still at that job and they pressured him to get it. He felt like he had to get it to support the family.

My son completely refused it. And I don’t blame him. He did feel pressure from his friends. He did get bullied. He did get kicked off the soccer team because he wasn’t vaccinated, and he wasn’t allowed to play. I told him, “If you want to participate, I’ll take you to get vaccinated.” “No, I don’t want it. I don’t want it.” And I didn’t push any further.

It was a simple question, “if you want it.” But because of what happened to me, he refused it and I’m very thankful for that.

Gayle Karding
How old is he?

Leigh-Anne Coolen
He’s 18.

Gayle Karding
Okay, those are my questions.

Commissioner Drysdale
You said that you had gotten one dose of one of the vaccines.

Leigh-Anne Coolen
Yes.
Commissioner Drysdale
When you went to get your vaccine, what did the person who gave it to you, the pharmacist, whoever it was that gave it to you: How did they explain to you the risks and the benefits of the vaccine so that you could make an informed decision?

Leigh-Anne Coolen
Nobody explained anything.

Commissioner Drysdale
Thank you.

Gayle Karding
Thank you very much, Miss Coolen.

[00:15:00]
Alison Steeves
Good afternoon. My name is Alison Steeves. Like Ches, I'm a non-practising lawyer, a member of the Nova Scotia Bar.

Ches Crosbie
Thank you. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Chet Chisholm
Yeah.

Ches Crosbie
Thank you.

Alison Steeves
Can you please state your name for the record?

Chet Chisholm
Yeah, my name is Chet Chisholm

Alison Steeves
And where are you from?

Chet Chisholm
I'm from Antigonish, Nova Scotia.
Alison Steeves
And what is your occupation?

Chet Chisholm
I am a paramedic. I've been a paramedic for 12 years.

Alison Steeves
For 12 years?

Chet Chisholm
Twelve, yes.

Alison Steeves
And how do you like being a paramedic?

Chet Chisholm
Oh, it's the best job in the world, man. It's probably one of the most rewarding professions that you can ever work. You show up on people's worst day and your goal is to improve it. No one's ever mad that the paramedics show up. Well, some are, but not many!

And with everything that's happened, if I had a lot of friends and colleagues, who say, “Hey, if you could go back and do it all again, would you?” And my answer has always been, “Yeah, I'd go back, and I'd have done it sooner.”

Alison Steeves
So back in March 2020, when we started hearing about COVID, were you working as a paramedic at that point?

Chet Chisholm
No, I was currently off work. I was off with workers' compensation in March of 2019. I was diagnosed with post-traumatic stress disorder and was placed on medical leave awaiting treatment.

Alison Steeves
Were you planning to return to work, eventually?

Chet Chisholm
Yeah, that was the hope. My mental health team was pretty keen on getting me back to work. I was gung-ho to get into treatment, get back on the trucks. And kind of what was looming on the horizon, and the state of EMS in Nova Scotia, I felt it was imperative to do so.
Alison Steeves
Did you receive the treatment that you were waiting for?

Chet Chisholm
No, I was on deck to get what's called EMDR, which is eye movement desensitization and reprogramming. It is often used very well with PTSD, and they see a lot of success with first responders and veterans. And my first appointment was kind of like the meet-and-greet appointment, to kind of set up a rapport. That was the first day of lockdown. So we showed up, we talked about what we were going to do, and that was it. Everything got canned thereafter, and then I was put into limbo and wasn't seen again for close to another year. Because we weren't allowed to have any in-person appointments whatsoever.

Alison Steeves
So you did get the treatment after a year?

Chet Chisholm
No. I went from a psychologist to working with a counselor, and we were kind of doing the prep stages, building the rapport, getting a background on what was going on. And things would kind of — We'd get a little bit of momentum and then they'd say, "Well, you can't meet in person again, and EMDR is an in-person thing."

So we'd have to just kind of do talk therapy on the phone and discuss things and talk about stressors. But we never really got to, we never got into a groove of things.

It was on and off, on and off, on and off, up until probably late spring, early summer of 2021. Things just kind of got canned again, and I got put back into the wait list and waiting in limbo. And where we continue to sit.

Alison Steeves
And what impact would you say that the delay in this treatment had on you?

Chet Chisholm
I’ve certainly had relapse since I saw my PTSD symptoms, which I’ve had previously somewhat under control. And not being able to — You kind of had to do maintenance while you’re working through this. And we couldn’t do any of that. And being in person, and actually being able to connect with somebody and talk about these things, and work through it, and then actually build to a therapy, is incredibly beneficial. There’s such a disconnect when it’s on the other end of a phone or on a screen. And not only that, but my counselor was getting extremely frustrated. She’s like, “you are pretty well primed and ready to go, we can get you back on the trucks and get you going. But this keeps getting in the way.” It’s like we always had to keep starting from scratch again.

Alison Steeves
So are you still on leave from the same job?
Chet Chisholm
Yes, I'm still on leave. And due to the time frame that I've been off with our contractual agreement with the union, because the clock has ticked down,

[00:05:00]

I've been terminated for my position at EHS [Emergency Health Services].

Alison Steeves
So you're only allowed to be off for so long with an injury before you become terminated.

Chet Chisholm
Yeah. At two years. They'll hold your full-time position for two years. So that timeframe ran out. And, as we'll get into it in a little bit here, that's when we needed to push for this, so I don't lose anything else. At a three-year mark, you're canned, and that's it. You lose all your seniority and everything.

Alison Steeves
Do you have reason to believe that, had you received the treatment in the time frame that was originally scheduled, you would have returned to work in time to avoid losing your job?

Chet Chisholm
Pretty well everyone in my mental health team was pretty keen. Like, pretty sure Chet's going to go right back on the trucks. He wants to be there. And there's been such a high success rate with this with other first responders. It was looking good. Not so much.

Alison Steeves
During the time you're awaiting treatment, did you take the vaccine against COVID-19?

Chet Chisholm
Yeah, there was a push for it from our employer. And initially, I declined because I was eligible in December of 2020 and January of 2021. Because I was off work, I'm a young guy, pretty healthy. I said, "No, thanks. I'll wait. If we're going to give it to anybody, give it to people who are vulnerable and whatnot, I don't need it right now."

But when it became available for people in my age group, for people in their 30s, I got my first shot on May 21st. And the reason is we work with the most vulnerable people at the most vulnerable point in their life. And we are in constantly different clinical situations throughout a shift. You can start your shift in a backseat of a car in a ditch. And then you can be in an old-folks home and treating a COVID patient. And then you could be going into the ICU. It's a mixed bag every time you go to work. So the likelihood that I'm going to get a lot of exposure to COVID is quite high. And it's going to be in the back of an ambulance. And it's going to be probably right in my face. So the hope was that this could help mitigate cross-exposure amongst vulnerable people.
Alison Stieves
You didn’t feel coerced to taking it?

Chet Chisholm
Yes and no. I was a little annoyed with kind of, the push. It’s like, “Hey you got to do this, you got to do this right now.” But I wasn’t ever angry at the point of getting it. Because if it did what they said it did on the tin, then that could be beneficial—both for myself but, more importantly, for the vulnerable people whom we deal with every day.

Alison Stieves
Who administered it to you, do you recall?

Chet Chisholm
It was given to me by an RN and that was done at one of the local pharmacies in Antigonish.

Alison Stieves
Before taking it, did they advise you of the risks?

Chet Chisholm
The only risk that we really discussed was the risk of anaphylaxis. Because I have food allergies. So we talked about that, because it’s like, “Hey, just hang around for like an extra like 20 minutes or so just so we can keep an eye on you.” And I’ve done vaccination clinics for flu shots and stuff. I know you know the whole rigamarole of, “Hey we’re going to give you this, we’re going to keep an eye on you and make sure nothing happens. And if something happens, we’ll report it and take care of you.”

Alison Stieves
And how did you feel after taking it?

Chet Chisholm
Initially, I felt fine. But by that evening, I was pretty slack; really, really tired. And that was kind of par for the course for any other vaccines I’ve gotten for work or school in the past. But what kind of really drew attention to some things is I’ve been dealing with PTSD and crippling insomnia for years at that point—for two years at that point, where I would need to take medication to sleep. I went from not sleeping at all, to sleeping most of the day, to sleeping probably like 20 hours or more. And then just being incredibly sluggish and getting a little shorter breath here and there, and that kind of escalated over the next few weeks.

Alison Stieves
So those symptoms persisted and increased?
Chet Chisholm
Yeah, it started with incredible fatigue, which led to shortness of breath. And then eventually, I would get a tinge of chest pain when I was laying on my back. And it ultimately built up to—My dad had taken a tree down in the yard, and I went out to help him just load a couple chunks of log in the front of his tractor.

[00:10:00]

I got extremely short breath. I had stabbing chest pain here, just left my sternum, which radiated into my back. I told my dad. I was like, “Hey, we have to go to the hospital right now; something’s up. I can’t say what, but there’s something very wrong at the moment.” And I became incredibly diaphoretic, really sweaty, and pale as a ghost.

Alison Steeves
Had you had similar symptoms in the past?

Chet Chisholm
No.

Alison Steeves
You said you went to the ER. You consulted a healthcare provider about these symptoms?

Chet Chisholm
Yeah, I went in, talked to the triage nurse and said, “Hey, this is what’s going on.” And was admitted, had EKGs and stuff done, and explained, talked to the nurse. These are all people I work with, and I’m like, “Dude, what do you think’s going on?” And it’s like, “Well, I think it’s one of these things.” And they’re like, “Yeah, something’s definitely up because you never look like this.”

We did a bunch of EKGs, blood work, did my vitals, my vitals were all abnormal.

Alison Steeves
And did they find anything?

Chet Chisholm
Not at the time. I was really hypertensive. My blood pressure was up quite a bit. I was tachycardic. But the doctor didn’t seem to see anything in my blood work or my EKGs. He just said, “maybe it’s just esophageal spasms,” and sent me on my way.

Alison Steeves
And did the symptoms persist after that?

Chet Chisholm
Yeah, they never quite resolved. They would calm down, but they did persist. And any time, on any exertion or lying on my back, things would exacerbate. I’d get more short of breath.
could, again, develop more chest pain. The fatigue persisted. Well, it still persists, but I would be pretty well bedridden some days. No energy to get up and do anything, which was entirely new. It was like a complete shift. Because I used to be up doing stuff pretty regularly. I used to be in really good shape and what not. So it was a drastic change.

**Alison Stieves**

And how many health care providers did you consult about these symptoms?

**Chet Chisholm**

Well, I was admitted into the emergency room three times over the course of the summer. Nothing was ultimately found, aside from having abnormal vitals and just symptoms that I presented with. The second physician that I saw in the ER kind of just shrugged and said, “Man, I don’t know what’s going on. You’re obviously in distress, something’s up, but we can’t pinpoint anything.” And the third doc I saw, which would have been probably late July, said, “I think this warrants further investigation. We should order some more cardiac tests, like echocardiogram, and you should follow up with your family doc, get a cardiac MRI, and get a stress test and see if we can pin down what’s going on. I don’t know for sure, but just on the way you’re presenting and what you’re telling us and your vitals—there’s something here, there’s something wrong, so we need to look into it.”

He actually gave me a shot of Toradol, which is a strong anti-inflammatory, which took the edge off for maybe a couple hours. But again, the symptoms persisted. I had discussions with my family physician, who was often very dismissive and abrasive about my concerns. And I’ve had a yearly follow-up that I had with WCB [Workers Compensation Board]. Because we have a follow-up every year where a physician comes in and talks to you, and it’s like, “Hey, how’s your PTSD going? What are the symptoms you’re having?” And we talked about that, and then we talked about this. And he’s like, “yeah, based on your history and kind of the cycle of symptoms, there’s something going on here, and we should look into it.”

**Alison Stieves**

Did you ask any of these physicians if there could be a link with the COVID-19 vaccine?

**Chet Chisholm**

I don’t think I ever asked if there was a link, but when they asked, “When did this start?” I told them I didn’t feel good after getting the vaccine and it hasn’t let up since. But I don’t think we ever specifically honed in. I suspected it, but do I know for sure? Absolutely not.

**Alison Stieves**

So they couldn’t find anything objectively wrong to explain your symptoms and they knew that they had started within close proximity to you taking the COVID-19 vaccine. Do you know if any of them filed an adverse event following immunization form?

**Chet Chisholm**

No, there was no discussion of that.
Alison Steeves

They didn’t ask you any more questions about that or indicate that they were concerned?

[00:15:00]

Chet Chisholm

No, none whatsoever.

Alison Steeves

How did they respond when you mentioned that it was in relation to the vaccine?

Chet Chisholm

It wasn’t really discussed; it was just kind of glazed over. Some of the nurses expressed more concern when they asked me. I had paramedic colleagues who expressed their concern just with the timing and some of the things that they had seen on calls that they have been discussing with me as well.

Alison Steeves

And have you shared your concerns about a link between your symptoms and the vaccine with others?

Chet Chisholm

Yeah, I’ve spoken to numerous family and friends and colleagues. And you get a mixed bag of the way people react. I’ve had people call me an anti-vaxxer, a far-right conspiracy theorist, and every other nasty thing under the sun. But then I’ve had others who’ve come to me and said, “This is what happened to me, this is what my family members experienced.”

I’ve had medical colleagues come to me and say, “Hey man, we were talking about what might have happened to you in the hallway. The other crew that was there was talking about how they had three kids who had myocarditis and POTS and stuff coming in through 911.” We don’t see kids in EMS very often, and that was concerning.

But yeah, it’s been a mix. I’ve had friends who have since abruptly stopped talking to me whatsoever. I’ve talked about this publicly and my concerns, and I’ve talked about some of the problems that we’re having in EMS right now. I’ve had people from across the country thank me for speaking about these things. Recently, I had somebody reach out and say, “You and I have never met, but I know who you are because you helped someone in my family on a 911 call, and they still talk about you years later. Thank you for doing this. Thank you for talking. Thank you for your service, and I’m sorry for what you’re going through.”

Alison Steeves

You had concerns that these might be related to the vaccine. Your first dose—did you end up taking the second dose?
Chet Chisholm
No, I did not.

Alison Steeves
And in October 2021, when Nova Scotia implemented the vaccine passport policy and several mandates, how did this impact your life?

Chet Chisholm
Well, because I’m not vaccinated enough, I was banned from restaurants. I wasn’t allowed to access some different services, couldn’t go to the gym—not that I was feeling well enough to do so anyway. When I went in to pick up the results from my echocardiogram and copies of my bloodwork and EKGs from the hospital, I stopped at the door and they said, “You can’t come in.” It’s like, “I’m picking up bloodwork, man, I just got to go around the corner.” And it’s like, “No, you need to be double-vaccinated to come in here.” And it was a back and forth throughout a good 20 minutes explaining, “I’m here because we’re investigating, trying to determine if something has happened with results as a result of this. I need to get that paperwork so we can figure out what happened, if anything.” Eventually they’re like, “Just let him go in, he’s just got to go around the corner. It’s 30 feet.”

And one of the worst things is that one of my best friends was diagnosed with cancer during the pandemic. And because I haven’t taken the shot twice, I wasn’t allowed to go see him when he was dying in the hospital. I never got to say goodbye to one of my best friends. Because “you’re not vaccinated enough, you’re not allowed in here.”

And, as many people know, the vaccine mandate for healthcare providers is still in effect. So even if I do get a clean bill of health and my PTSD is, you know, wiped clean, we’re going to go. I’m still banned from going back to work: I’m not allowed to go.

Alison Steeves
Chet, do you have any final words about the impacts of the COVID-19 measures on your life?

Chet Chisholm
Yeah, it’s had a significant impact, not only on my mental health, but on my physical health. Associated with PTSD as well. And you can see just with the way EMS is right now in Nova Scotia: Morale is plummeting every day since the start of 2020. We have lost 331 paramedics from the workforce, that’s one quarter of the paramedics who work for EHS. We’ve since hired some new people, but these are people who are fresh out of school; they don’t have experience. Even on my rotation, there’s four of us on my rotation that have either been put off on injury or PTSD. And there’s 60 years between the four of us. And that’s gone, you can’t get that back.

[00:20:00]

It’s infuriating. It’s also detrimental to the well-being of everybody in this province that there’s people like me—and I’m not the only one who’s in this situation—who want to go back to work. And who would like to help and who would like to fix the problem, as the EMS system is crumbling. But we’re told no. I’ve even spoken to Michelle Thompson and the answer is, “That’s the policy. We’re sticking with the policy.” And if you haven’t seen
what the medical exemptions are to get to opt out for healthcare provider: you need to have either blood clots, myocarditis or pericarditis, a stroke, or have an allergic reaction. All of which have to result from the first shot. You have no medical exemption, it's “take it or else you’re let go.” Or if you have an adverse event, you’re probably not going to be working again anyway.

**Alison Steeves**
Thank you. That’s all my questions.

**Chet Chisholm**
No problem.

Alison Steeves
Do the commissioners have any questions? No.

Chet Chisholm
Cool.

[00:21:50]

[00:00:00]

Ches Crosbie
Thank you for attending as a witness, Mr. Anselm. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Artur Anselm
Yes, I do.

Ches Crosbie
Thank you.

Nicolle Snow
Good afternoon, Mr. Anselm. Where are you from?

Artur Anselm
I just live in Grand Lake, Nova Scotia. Just about 40 minutes from here.

Nicolle Snow
And who do you live there with?

Artur Anselm
Just in the backyard, in a small cabin. I live with my parents right now, but I'm building a house for my family, so.

Nicolle Snow
Nice. For your family, you said?
Artur Anselm
Yep, my wife and small daughter. She’s 14 months old.

Nicolle Snow
And are you employed?

Artur Anselm
Yeah, I work for Canadian National Railways.

Nicolle Snow
What do you do there?

Artur Anselm
I’m a track maintainer. I make sure the tracks are safe for the trains to run and we repair any defects and change rails. Stuff like that.

Nicolle Snow
And how long have you been employed with CN Rail?

Artur Anselm
Six years, it will be six years this year.

Nicolle Snow
And what policies or mandates did CN Rail adopt during the COVID crisis days?

Artur Anselm
November 2021, they implemented the vaccine mandate. And if you weren’t vaccinated, you were off paid, off work. Forever, basically.

Nicolle Snow
What was the deadline that employees were given to vaccinate by?

Artur Anselm
The deadline was November 15th, 2021.

Nicolle Snow
And did you receive notification of that directly from your employer?

Artur Anselm
Yeah, I received it from my supervisors and my managers. And work emails as well.
Nicolle Snow
Okay, and you brought in with you today an email dated September 8, 2021, from CN Communications, stating that there was a vaccine mandate that would be effective as of November 1st, 2021.

Artur Anselm
Yes, that’s correct.

Nicolle Snow
Okay, and that will be marked as an exhibit [exhibit number unavailable]. What happened after that?

Artur Anselm
Well, basically I was very much against taking any shots. Because I saw what was happening to my co-workers after the vaccines and they were getting sick. They weren’t feeling well.

And I really held my stand up until— I was becoming a new father and I had to put food on the table for my family. So I decided to bite the bullet. And on November 13th I took the first shot.

Nicolle Snow
And to clarify, did the timeline for vaccinating remain November 1st? Was it extended?

Artur Anselm
It was extended. It was November 1st and then I just kept not getting it and then they extended it to November 15th. And then on the 13th, I took the shot.

Nicolle Snow
Okay. Just to confirm, Mr. Anselm, you brought in with you today an email dated October 14, 2021, from CN Rail indicating that the mandatory vaccine deadline was extended to November 15th. And what you’re saying is, on the 13th, you went ahead and got your vaccination.

Artur Anselm
Yeah.

Nicolle Snow
Did you do so feeling coerced or pressured?

Artur Anselm
Definitely. I was getting phone calls daily from supervisors and everybody and telling me, “After the 15th, you can’t come to work, and you’ll be off pay.”
Nicolle Snow
All right, and so were they indicating that they were going to terminate you? Or put you on leave without pay.

Artur Anselm
They weren’t clear with it. They said either you’re terminated or you’re going to be off pay, basically laid off. So I wasn’t sure what was going to happen.

Nicolle Snow
What happened on November 13th when you had your vaccination? Where did you go?

Artur Anselm
To be honest, I don’t remember the location—but it was just a walk-in clinic and a nurse vaccinated me.

Nicolle Snow
All right, and do you know that it was a nurse? Did she tell you it was a nurse?

Artur Anselm
She did not, but that’s my assumption.

Nicolle Snow
Okay. Do you know that the batch number of your vaccine?

Artur Anselm
No, I could look it up, but I don’t know it right now.

Nicolle Snow
Were you made aware of any of the potential risks associated with vaccine?

Artur Anselm
Yeah, I was aware from my own research from before.

Nicolle Snow
Sorry, I’ll cut you off. I mean, did the person who administered the vaccine have any discussion with you about the risks associated with the vaccine?

Artur Anselm
Yeah, she actually told me that, for guys my age, there is a potential risk of having heart problems. And she said, “Oh yeah, if you have any heart issues just go to the doctor’s office.”
They'll give you some drugs and make you feel better." And I was like, "Okay that sounds pretty good." I didn’t want to take it, but I still did.

**Nicolle Snow**

It didn’t sound overly serious, in your view.

---

**Artur Anselm**

No. Like, why are you guys making me take this if there’s risks? And I’m perfectly healthy, right?

**Nicolle Snow**

What if any symptoms developed following the first vaccination?

---

**Artur Anselm**

Well, first of all: a week after my vaccine, I got seriously ill, just with very bad flu. And I was basically out for a week. And then two weeks following my vaccination, I started to develop heart pain. And the heart palpitations, shortness of breath, weakness. And just I didn’t feel good at all. I felt like I knew something was wrong, especially with my chest. I kept getting stinging chest pain.

**Nicolle Snow**

And had you had any of these kinds of symptoms before in your life?

---

**Artur Anselm**

Never. No.

**Nicolle Snow**

And how old are you, Mr. Ansel?

---

**Artur Anselm**

Now I’m 26.

**Nicolle Snow**

And how old were you when you got the vaccine?

---

**Artur Anselm**

I would have been 25 years old.

**Nicolle Snow**

What did you do when you started experiencing these heart pain symptoms?
Artur Anselm
Well, I went to the emergency room at the Cobequid Health Center. Just did a walk-in emergency and they checked my vitals. They took my blood. They made sure I wasn't having a heart attack and basically sent me on my way.

Nicolle Snow
Did you have any discussion with them about whether this could be vaccine-related?

Artur Anselm
Yeah, I did. I told them this all started after the vaccine. I never had any issues with my heart or anything like that. And they just said, "Oh yeah, like whatever, you're good. You don't have a heart attack, so."

Nicolle Snow
Okay. And was there any discussion about completing a vaccine adverse event form?

Artur Anselm
No, I never heard anything about that.

Nicolle Snow
So as far as you know, that was never completed by the doctors?

Artur Anselm
No.

Nicolle Snow
And what happened after that?

Artur Anselm
After that, I went home, and I kept going to work. I kept fighting the pains. And then I decided to go to my family doctor as well. I told him what was going on after the vaccine, that I was having chest pains and shortness of breath. And same thing with him. He said, "No, it's probably not from the vaccine. Just don't smoke anything. Don't drink anything. Don't have a heart attack, so." And they just said, "Oh yeah, like whatever, you're good. You don't have a heart attack, so."

Nicolle Snow
Okay, and did your doctor or your family doctor have a discussion with you about whether or not to fill out an adverse event form?

Artur Anselm
No, we never had any discussions about that.
Nicolle Snow
And your doctor didn’t feel that there was any connection between the vaccination and the symptoms you were having?

Artur Anselm
No, he did not.

Nicolle Snow
What happened after that?

Artur Anselm
After that, I went in again to my family doctor. I told him, “Listen I’m going to lose my job if I don’t get the second shot.” I didn’t really want to get it at all, obviously. And I asked him, “Can you fill out a medical exemption for me?” And he said, “No, I can’t do it without any proof.” I just said, “All right, I guess I’ll be laid off.” Then I went in again—I think it was my third time—and he finally referred me to a cardiologist to get an MRI.

Nicolle Snow
Okay, and so then did you go to the cardiologist?

Artur Anselm
Yeah, I saw the cardiologist. They scanned my heart and did all the tests. And it turned out that the outer lining of my heart was inflamed. And I had pericarditis, myocarditis. And the cardiologist said, “This is from the vaccine.”

Nicolle Snow
Okay, and so who is the cardiologist that you saw?

Artur Anselm
His name is— One second, sorry. Dr. Douglas Bate, or, sorry, Hussain Beydoun. That was his name.

Nicolle Snow
B-E-Y-D-O-U-N. And you brought with you today a letter from Dr. Beydoun dated February 11, 2022. Do you have that in front of you?

Artur Anselm
Yep. I’ve got it right here.

Nicolle Snow
And would you look at page 2?
Artur Anselm
Yup.

Nicolle Snow
And just read the first line at the top of that page.

Artur Anselm
“Very likely, Mr. Anselm has pericarditis, myocarditis post-mRNA vaccine, echocardiogram done today was normal in the view the symptoms improved significantly. I would not start anti-inflammatory therapy. Any change, please let me know and I will be happy to reassess him. I would not recommend him for a second dose, and I am copying this to my colleague.”

Nicolle Snow
All right. Mr. Anselm, you received that exemption,

[00:10:00]
to not have to take the second dose, correct?

Artur Anselm
That’s correct.

Nicolle Snow
All right. And let’s go back to your employment. Had you been working through this at this point?

Artur Anselm
No, it turned out I had just had a kid, so I was able to get the parental benefits, even though I was laid off. So that kept me going, luckily.

Nicolle Snow
Okay, so you were on parental leave during this period. And what happened with respect to the exemption that you had? Were you able to use that to return to work?

Artur Anselm
No, I was still kind of pissed off. I didn’t really want to talk to anybody. And then my manager called me in July. He said the mandates were dropped and you can return to work. I said, “All right, I’ll take my whole leave until September and then I’ll come back to work.” September 2022 is when I returned to work.
Nicolle Snow
So there was no period where you had to return to work prior to the mandates being dropped.

Artur Anselm
Yeah, that's correct.

Nicolle Snow
You remained off in your parental leave.

Artur Anselm
That's correct.

Nicolle Snow
Did you have any conversation with them during that period when you were on parental leave as to whether or not they would take you back with the exemption?

Artur Anselm
No, I did not. I just didn't even want to bother for now.

Nicolle Snow
Okay. How has your heart condition impacted your life?

Artur Anselm
It has impacted me in every aspect of my life. Physically, I can't really do the things I used to anymore. Like with less vigor. Mentally, I was just full of regret, and it made me kind of a less of a father—not less of a father, but mentally I was down. It impacted my fatherhood. Mentally, physically, everything.

Nicolle Snow
All right. Thank you. Those are all my questions. And we'll just pause for a moment to see whether the commissioners have any questions.

Commissioner Drysdale
You said that you had worked with CN Rail, I think you said six years?

Artur Anselm
Yep, six years.
Commissioner Drysdale
When you signed your contract with CN Rail, your employment contract, was there a clause in there requiring that you had to take whatever vaccines that they might require in the future?

Artur Anselm
No, there was none of that. In my eyes, it's illegal what they did.

Nicolle Snow
Thank you, Mr. Anselm.

Artur Anselm
Thank you.

[00:12:55]
Witness 11: Kassandra Murray  
Full Day 1 Timestamp: 07:48:00–08:22:55  
Source URL: https://rumble.com/v2ddo8a-nci-truro-day-1.html

[00:00:00]

Ches Crosbie  
Kassandra, do you affirm that in the evidence you will give this Commission, you will tell the truth, the whole truth, and nothing but the truth?

Kassandra Murray  
As a child of God, yes, I do.

Criss Hochhold  
Thank you. Kassandra, would you please give us your full name?

Kassandra Murray  
Kassandra Maureen Murray.

Criss Hochhold  
Where do you live, Kassandra?

Kassandra Murray  
in Halifax, Nova Scotia.

Criss Hochhold  
And what do you do for a living?

Kassandra Murray  
I am a teacher.
Criss Hochhold
Fabulous. Where do you teach?

Kassandra Murray
Currently, I just teach privately. I used to teach, though, in a private school.

Criss Hochhold
Okay. Which private school, or school, were you teaching at?

Kassandra Murray
You want me to name the school?

Criss Hochhold
No, that’s fine. Let’s just say a private school.

Kassandra Murray
Yeah, it was a private school within the Halifax.

Criss Hochhold
And how long were you teaching at that private school?

Kassandra Murray
I was there for— I think, three years.

Criss Hochhold
Three years at that school. And how long were you a teacher overall?

Kassandra Murray
Over 20 years.

Criss Hochhold
Twenty years. That’s some significant experience there.

Kassandra Murray
Correct.

Criss Hochhold
And what grades, or grade, did you teach?
Kassandra Murray
At the time, at that school, I was teaching a Grade 1-2 split.

Criss Hochhold
So that would make the kids about—?

Kassandra Murray
Anywhere from six to eight years old.

Criss Hochhold
Six to eight years old. When the mask requirements came in—You have a mask exemption from a physician, is that correct?

Kassandra Murray
That’s correct.

Criss Hochhold
How was your experience getting that exemption?

Kassandra Murray
From my physician?

Criss Hochhold
Yes.

Kassandra Murray
My physician was really good about it, actually. I went in there and I explained to him why I didn’t want to wear a mask, what I felt, how it would impact my health. And he had no problem giving me the exemption.

Criss Hochhold
Fantastic. Did the school respect that exemption?

Kassandra Murray
For a short while. But there was a lot of toxic and harmful situations I was put in—like, a hostile environment that I was put in, because I had that medical exemption.

Criss Hochhold
Okay. Can you give me an example of such a hostile act that they took towards you?
Kassandra Murray
Sure. When I first came in with the exemption, they were not really happy about it. They put it on file, though, so that it was well-documented that I had it. And they said that, because I wasn't wearing a mask, I had to—they didn't say I was segregated, but I'm saying it—I was segregated to use a different bathroom. I wasn't allowed to use the same bathroom as the rest of the faculty. I had to use a bathroom that was in the basement that wasn't very clean. The school had a mold mildew issue, which I was working on with my lungs too. So that didn't help it at all.

I had to use the bathroom in the basement. And every time I had to go to the bathroom, I had to leave the children, run down the stairs, go to the bathroom, come back up, and come back into the class. I also wasn't allowed to use the faculty room where they took their breaks. I had to go into this small closet that was right beside my room, that we used to use as a cubby room. And it was about—I don't know—maybe about five feet wide by about 20 feet deep. There was no ventilation in this room, just the door going out to the hall. So often when I would go into that room during break time, during my breaks, I would have to leave the door open to the hallway just so I could get some fresh air in there.

That room was also used that, if children were sick, then the child would have to go and be put in there. And if that was the case, I couldn't be in there and I needed to leave the building. So rain or shine, that's where I was.

Then the other piece was: I couldn't use the bathroom. I couldn't use the faculty room.

Criss Hochhold
Can you tell me about potential meetings, faculty meetings?

Kassandra Murray
Even though I wasn't allowed to use the faculty room, I had to stay six feet away from everybody. At a faculty meeting, I was allowed at the faculty meeting.

[00:05:00]
where everybody was in the same room. They were six feet apart, and I wasn't wearing a mask. And some of the other faculty members would also take off their masks. I was allowed in that, but I wasn't allowed in the other situations.

Criss Hochhold
Please correct me if I'm mistaken. But you were able to attend faculty meetings with other faculty who were comfortable taking their masks off. Were you able to share a lunch space with that same faculty?

Kassandra Murray
No, I wasn't allowed to go in that room where they were doing that.

Kassandra Murray
And even at one time, if I may, I was sitting in that cubby space—that small closet—and I was doing some work and having something to eat. One of the faculty members, I was down
like, near the end, not near the hallway door. And a faculty member came by the door. She looked in and she said, “I'm going to close this door because you're breathing in there.”

And she closed the door, and I didn’t know what to say. I said, “Fine.” And I just—yeah.

**Criss Hochhold**
She closed the door because you were breathing in there.

**Kassandra Murray**
Closed the door because I was breathing in there, yes!

**Criss Hochhold**
That’s very interesting, because I don’t normally go into rooms and not breathe.

**Kassandra Murray**
Yeah!

**Criss Hochhold**
I think we all have similar experiences; we all tend to breathe no matter where we go!
**Unless it's the other place, and we won't go there—**

Kassandra, how did that make you feel?

**Kassandra Murray**
It was really traumatizing for me. It made me feel uneasy. I started seeing psychotherapists to kind of help me through the trauma of what it was doing to me. It made me feel really isolated and cut off from faculty members that I had called friends before. That now, I wasn't a friend, you know, because I wasn't complying.

Yeah, it was really harmful; it was really damaging to me. And then also, because it was such a toxic and harassing environment, I felt like I was policed all the time. They were walking by the room— Because I had to stay six feet away from the children within my classroom. And with grade one and two, which is like herding cats sometimes, it's very difficult to stay six feet away from them without a mask. I would see teachers kind of peeking in the room, making sure there was no children around me and things like that. And they would often have parents come into my room to kind of “help,” because the parent would mask. And I wouldn't.

**Criss Hochhold**
To your knowledge, were any of the other teachers “policed” like that?

**Kassandra Murray**
Not to my knowledge.
Kassandra Murray
Yeah, so prior to the COVID protocols, I always met my children at the door every morning and shook their hand. We look at each other in the eye. We shake each other’s hand, and we say good morning to one another. And it’s a good way to connect with the child. It’s a good way to get an assessment of: What does their hand feel like? What is their handshake like? Is it firm? Is it weak? Is it wet? Is it sweaty? Is it dry? Are they making eye contact with me? And it gives me a good indication of how I can best serve that child that day. And then at the end of the day, we would also do the same thing. But that stopped with the COVID protocols. I had to get creative and inventive.

Criss Hochhold
What do you mean when you say you get creative and inventive?

Kassandra Murray
I still wanted to—Because I know how harmful it is for a child to be disconnected. When they’re in a traumatic experience or in an environment like that—where they’re feeling fearful, because it was really inciting a lot of fear in the children—to have that connection is really important. Because they tend to disconnect and you can see that. I could see it in the class and how that was playing out with the children. I thought, “I need to somehow keep this connection with the children.” So I had each child get a tree branch of some sort, six feet long. Then we decorated the ends: one end was a red or pink. The other end was blue.

So that we always knew what end I would shake—the color—and what end they would shake—the color. So it wasn’t getting mixed up, and we would still shake hands with the stick.

Criss Hochhold
Well, at least you were able to creatively form some sort of connection with the kids, even though the schools and the mandates brought in some rather ridiculous rules and procedures.

Kassandra, you’ve been a teacher for a long time. How would you compare the learning environment that was brought in by the school system at those times versus the years prior?

Kassandra Murray
Well, our faculty meetings became more and more geared towards how to police protocols for COVID and what Public Health was mandating. And so, then our teaching became more fear-based and informed that way with the children. You know, “Make sure you sanitize your hands every day before we go outside the room.”
And if I may elaborate on that: one of the rules was that even if the children were going out
into the hall to the bathroom to wash their hands with soap and water, they had to sanitize
before they went out. Just in case they touched the walls. And there was one line going this
way and, six feet apart, one line going this way, like a coming-and-going line. So they were
watching to make sure I was making sure the children would self-sanitize. What happened
was, one of the children came in and she had caustic burns on her hands from the sanitizer.
And I thought, “Oh my god, this is awful, why are you doing this?” And her parent actually
wrote in and said, “I do not want my child putting sanitizer on her hands. She’s fine to just
wash them.” I was very grateful that that parent chimed in for that.

Criss Hochhold
Absolutely. You’ve seen some devastating things physically on the children because of the
caus tic burns from the overuse of sanitizer. What about their mental state?

When I think back when I was a kid—not that that’s a good thing—but you know, trying to
have a happy childhood. And a teacher was that connection, particularly in those very early
grades. Because really, at the end of the day, you do become a replacement parent for some
little kids that are five, six, seven years old. You take on a bit of a motherly role.

Criss Hochhold
After the precautions were brought in, how was the learning environment? How were the
kids? Like were kids being kids? Or what would you compare it to?

Kassandra Murray
Prior to the protocols, the children would go to each other’s desks. They would eat
together; they would play games together; we would put all our desks together for birthday
celebrations; we did all these things. After, we weren’t allowed to do that. And even outside,
they were supposed to be six feet apart, and they weren’t allowed to sing. And they weren’t
allowed to sing inside, and if they were singing outside, they had to sing six feet apart.

So the children become fearful of one another. Their self-regulation is being either stopped
or it’s going to be delayed, because they’re unsure of what they need to do and where they
need to go. Their cognition—

Because there were children that were masking in the class. It wasn’t mandated at that
time for the children to be masked, but some families wanted their children masked, and
some families even had children double-masked. And you could see the blood drain from
their face. They didn’t have the rosy cheeks and things like that; you could really see the
difference. Their cognition, their rate of taking something in and digesting the education
that they were being given—It’s like eating a bad meal, right? It wasn’t working, and you
could see that they couldn’t keep up or they were really tired, or they got tummy aches.
You’d see a lot of that happening. And I had this special little tent in the room that I had to
sanitize every time somebody came in or out of it. But at least it was a space where the
child could curl up with their own little blankie and pillow.

[00:15:00]

And just kind of regroup a little bit, reconnect in that space, a shelter.

Sorry if I’m going off on a tangent a bit.
Criss Hochhold
That’s okay, you’re talking about the kids and that’s great.

Kassandra Murray
You can see that this development of self-trust, development and trust in others starts to get delayed, or impaired in some way. Because they’re cut off, have sensory deprivation. Their sense of touch is cut off, even their sense of hearing could be cut off if they’re not hearing their friends properly. Or somebody that is muffled, you know: other teachers that did come in and had a mask on, you can’t properly hear tone in the voice. So you can’t really comprehend what’s being said to you. And there’s a lot of sensory deprivation that was happening there. The sense of smell, taste—all of those things were slowly declining in the children that were wearing masks.

I found, where typically I had a certain curriculum, that I was bringing at a good rhythm and everybody was able to digest, now I really had to pull back on that. I really had to have intuitive pedagogy, right? Where you kind of have to intuit what the children’s needs are and just meet them where they’re at.

Criss Hochhold
Absolutely. As with any school system, whether public or private, there would be learning outcomes that should be met or need to be met, so we know that the kids are progressing at a set pace, if you will.

Do you find that you were able to meet those learning objectives that had been set for those kids?

Kassandra Murray
I would say those learning objectives were definitely delayed. Like I just said, where I had a certain rhythm, you knew by this time you wouldn’t be meeting these outcomes. Typically, that’s how it worked, but they were really pulled back—not just because of the impairment of the children being able to digest the information, but also from the onset of the unnecessary protocols that we were always told to police with the children, to make sure they understood the rules and what needed to happen. And then trying to explain that to the children in a way that’s loving and kind and warm so that it doesn’t further incite any fear.

Criss Hochhold
Absolutely. That makes perfect sense, Kassandra. I’m just going to take you back for a moment because your colleagues certainly seemed to have an extreme fear of someone that wasn’t wearing a mask. How did the kids feel when you showed up in the classroom with no mask? Did you have to give an explanation as to why you, this teacher, is not wearing a mask and some of the rest of the teachers are?

Kassandra Murray
With children at this age, typically they’re part of the whole. They haven’t really quite come into their own self-individuality. That usually happens around the nine-year change. At this age, their consciousness is more, “I’m part of the whole. You’re part of me, I’m part of you.” There were some children that were like, “Miss Kassandra, why don’t you have to wear a
and I decided that this was not in my contract; this was not the terms of my employment. So that was where I said “no.” And they just kept making this environment for me at the
of having to deal with that, and I have a medical exemption.

enough. I am not stepping in front of those children with that.” Never mind my own trauma
or two weeks. They said, “Well, we can’t have you back in the classroom; we can’t honour
I’m not quite sure, but this is 2021—they were going to go back into the classroom for one
coming back from the online learning, it was mandated that all the children and everyone

Criss Hochhold
Wow. It’s kind of frightening what happened and what managed to be brought in and
imposed on our children. I don’t really have any other questions, but is there anything that
you feel that you’d like to ask before I defer to the commissioners?

Please go ahead.

[00:20:00]

Kassandra Murray
Yeah. So, one of the other things that had happened, just to give you another picture, is the
executive director, who’s supposed to be impartial and fair to everyone: one day I was
walking close to the office, and she was coming out of the office, which meant that we were
kind of going by close to one another and she had her mask on. She literally turned her back
to me because I was walking beside her.

And then after, there was a time where we all went online. I won’t even get into how
detrimental that is for children, but then we went online learning. And when we were
coming back from the online learning, it was mandated that all the children and everyone
within the school had to wear a mask. Even the little pre-primary ones all had to wear a
mask. So they called me, and they said, “We can’t have you come back to school. We can no
longer honor your medical exemption and we won’t, and we can’t have you back to school.
What we’re going to do is we’re going to put you on paid leave, but we’re going to have a
substitute teacher lead your class and you have to provide them with lesson plans.” I did
that for a few weeks and then everybody went off online again.

So then, near the end of the school year—I think it was the end of May, beginning of June,
I’m not quite sure, but this is 2021—they were going to go back into the classroom for one
or two weeks. They said, “Well, we can’t have you back in the classroom; we can’t honour
your medical exemption and we won’t. Unless you want to wear this helmet—” It’s called a
microclimate helmet; they were willing to pay over $400 for this microclimate helmet that
looks like one of those old sea diver helmets. I thought, “No, I’m not; those children have
enough. I am not stepping in front of those children with that.” Never mind my own trauma
of having to deal with that, and I have a medical exemption.

So that was where I said “no.” And they just kept making this environment for me at the
school very toxic, very hostile. Watching me all the time. All these little things adding up
and I decided that this was not in my contract; this was not the terms of my employment.
My terms of employment were significantly changed. And so, due to the employer’s conduct, I felt forced to leave my job. And I made my decision to resign.

**Criss Hochhold**
Fantastic. So just quickly to reiterate: you had a valid medical exemption from a physician in Nova Scotia. And the school chose to disregard it entirely and essentially told you, “Your exemption means nothing to us. If you want to come and put on a spacesuit and teach—” Because that would be a wholesome environment to them.

**Kassandra Murray**
That’s correct.

**Criss Hochhold**
Thank you very much, Kassandra.

**Kassandra Murray**
You’re very welcome.

**Criss Hochhold**
Have a great day.

**Commissioner Drysdale**
I have a couple of short questions. I believe you mentioned that there were still faculty meetings going on.

**Kassandra Murray**
Correct.

**Commissioner Drysdale**
And you’d attend those faculty meetings. Some people didn’t have masks on and yet seem to be okay. My question has to do with the intent, or the content of those faculty meetings. How much time, if any, in those faculty meetings was spent discussing the protocols for masking, et cetera, versus what protocols should be in place to compensate for the things you were seeing going wrong with children? With their learning being reduced or being impeded and some of the social issues.

My question is: How much time were they spending trying—those coming up with protocols—

[00:25:00]

to mitigate the effects of the masks on the children’s learning environment?
Kassandra Murray
I would bring something up to try to mitigate, and I was immediately shut down. There was very little to none on mitigation. I would say that probably one third of the meeting was spent on protocols, what we need to do, how we could be better. I even have an email that was sent out by the executive, by the education director. It was sent out to all the faculty. And she specifically named me in this email, and she says, “For you, Kassandra, I would ask that you double up on your physical distancing and also support the parents who come in to support the class during transitions as well as in class time.”

So I was really put in the spotlight because of what was a private thing for me with my medical exemption. And that was put out through the whole school.

Commissioner Drysdale
I just want to make sure I understand that they said you had to double up on your distancing.

Kassandra Murray
That's what they wanted me to do.

Commissioner Drysdale
Your distancing was six feet and they wanted—

Kassandra Murray
They wanted me to do 12 feet.

Commissioner Drysdale
How many kids were in the classroom?

Kassandra Murray
How many did I have that year? I remember, I would say approximately 18.

Commissioner Drysdale
Would it be possible in a classroom to be 12 feet away from 18 children?

Kassandra Murray
No.

Commissioner Drysdale
I have one other question, and maybe it's just I didn't understand something about this. I thought you said that you weren't allowed to go into the lunchroom and have lunch with the staff?
Kassandra Murray
Correct.

Commissioner Drysdale
Did they eat their lunch with the mask on?

Kassandra Murray
I wouldn’t know because I wasn’t allowed in the faculty room!

Commissioner Drysdale
Thank you, that’s all I’ve got.

Kassandra Murray
You’re welcome.

Commissioner Massie
I have two questions. One short question. You probably have heard— I’ve never seen it myself, because I’ve been out of the university and school, and so on, for a long time. I’ve heard that there are a lot of issues in the American campus, but maybe also in some places in Canada, about the so-called safe space and microaggression. That is, people that are sensitive to opinions or behavior. And I’m trying to understand what that could represent in an environment but with teenagers or young adults. Maybe this is something that can be, I don’t know, managed somehow.

But in a school with children like that and among adults, which are the faculty: Would you compare what you’ve lived through to something like microaggression?

Kassandra Murray
I don’t know. I’m not sure how to answer that question. I know I felt segregated, and I felt discriminated against. I just felt very isolated. I don’t know about the microaggression piece.

Commissioner Massie
So how did you feel emotionally?

Kassandra Murray
Oh, emotionally. Emotionally, I was really traumatized. I was really sad, and I was thinking, “What am I going to do for work now, how am I going to make a living? I can’t go back into that environment; they won’t even let me back into that environment.” You know, they made it very difficult for me.

I went into this very anxious, stressful state of fight or flight and thinking, “Okay, I need to go boots in. And just get moving and figure out what I’m going to do.” And that’s where I was really grateful that I had this doctor that was helping me, a psychotherapist. Because she was really helpful to help me get through that stage.
**Commissioner Massie**

My other question—Maybe you’re not aware of it, but in Quebec they conducted a very extensive study to look at the impact of these measures in school on the learning process and behavior of the children, and so on.

Are you aware of similar studies in Nova Scotia?

**Kassandra Murray**

I’m not aware of similar studies in Nova Scotia directly.

But from some of my training in working with transdisciplinary healing education, working with educating traumatized children, right?

[00:30:00]

And seeing how trauma and these things not only have mental health implications and psychotherapy indications for the children at the time—If it’s not worked out immediately, it can turn into other illnesses and disease, right? But it also can have a delay in the development of their organs, in the development of how they move and their growth.

So there is a lot that can happen physiologically and psychologically with the children.

**Commissioner Massie.**

Thank you.

**Criss Hochhold**

Thank you very much Kassandra, I really appreciate your time.

Oh—I’m sorry, my apologies. Let me take that back for a moment. I’m sorry. I still appreciate your time, but we have one more question.

**Commissioner Kaikkonen**

Hi Kassandra, I just want to take it just a little bit bigger, broader. Who determined the protocols? Was it external and was it the provincial health, or was it just internal within the private school system?

**Kassandra Murray**

We were told that they were getting their mandates from Public Health. That’s what we were told at faculty meetings. The school had put together a small group of individuals—teachers and parents that put together what they felt were the measures and protocols that our school would be doing. So they were getting this from Public Health; they were getting whatever mandates or protocols. And then they would take that, and then they would implement it in a way, for our school, following those guidelines. That was my understanding. That’s what we were told.
**Commissioner Kaikkonen**
Were you ever given a copy of those mandates from provincial health, or you just read about in the media, that kind of thing?

**Kassandra Murray**
I don’t recall being given anything. I just remember us being told this was what was happening. Yeah, it was kind of like an agenda note, right? This is part of our agenda. But it didn’t go into—

**Commissioner Kaikkonen**
Did you see any discrepancies with what was happening within your private school as compared to other schooling alternatives in Nova Scotia? I’m not from here, so that’s why I asked.

**Kassandra Murray**
I wasn’t sure what was happening in the public school system because I’m not part of that. I just knew what was happening in our private school, I didn’t know too much about what was happening in the other school systems. I was just really involved with what we were doing.

**Commissioner Kaikkonen**
And then one final question: In terms of incident reporting, was there any reporting process within the school system for the hand sanitizer issue?

**Kassandra Murray**
No, there was no incident reporting for that. It was the parents coming back to say, “my daughter has caustic burns from this overuse of sanitizer, and I don’t want her using it anymore.”

**Commissioner Kaikkonen**
There would be no path to document what was happening with that child and taking that information—sorry, I just lost my voice, I think—to the public health authorities?

**Kassandra Murray**
Not that I’m aware of.

**Commissioner Kaikkonen**
Okay, thank you.

**Criss Hochhold**
Is there one more question forthcoming? No.

We do have an audience question for you, Kassandra, as well. The question is: Thinking of air quality and our scent-free schools, did the hand sanitizer have any negative impact?
Kassandra Murray
As far as scent sensitivity?

Criss Hochhold
Yeah. Usually I find that, and I'm going to presume that with whoever is asking the question— Are you talking about scented hand sanitizers? Because they were both available, I believe, at the schools.

Kassandra Murray
Have a smell to them, yeah. In my class personally, I didn't notice any scent sensitivities to the sanitizer, only the physical sensitivities of rash, the burns, things like that.

Criss Hochhold
Wonderful. I believe we've got all the answers to all the questions. Thank you once again very much, Kassandra.

Kassandra Murray
Thank you.

Ches Crosbie
Thank you all. The hearings will rise for the day and reconvene tomorrow at 9 a.m. Thank you.

[00:34:55]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

EVIDENCE
TRURO HEARINGS

Truro, Nova Scotia, Canada
March 16 to 18, 2023
ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using OpenAI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the “intelligent verbatim” transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at https://nationalcitizensinquiry.ca.

Ches Crosbie

An existential threat to our democratic way of life occurred towards the democracies in the 1930s. It was called the Great Depression. But when Franklin Delano Roosevelt made his inaugural address as President of the United States in 1932, he didn’t tell people to be afraid and stay home. He told Congress and the free world that we had nothing to fear but fear itself. We heard a bit yesterday from Shelly Hipson about how data and statistics were manipulated to make people feel afraid in this province, Nova Scotia. No great nation prospers and grows on a platform of fear. But as a virus spread out from Wuhan China, governments chose to opt for fear and to ignore their own previously approved and adopted pandemic plans, which instructed them to protect the vulnerable, allow others to carry on their lives normally, and maintain public confidence. They panicked into a war against a virus—a war which all reason and experience told them was futile and doomed to failure. And the first casualty of war is the truth.

Many citizens might say the COVID crisis is over. I just want to forget about it, move on. The problem with forgetting about it and moving on is that governments may never relinquish power and control once they have it.

Coercive measures such as injection mandates to travel by air are only suspended, to be brought back whenever government deems necessary. And in many settings, including courts and hospitals, mask mandates are still in effect, despite the evidence of myriads of studies, the latest one being the famous Cochrane review—the definitive study on masking, which reviewed 78 randomized control trials and concluded that masking was completely ineffective. Masking of any type. That came out just two or three weeks ago. And they continue to double down on their advocacy of injections whose efficacy data, you will hear, has turned negative and whose safety is in heavy scientific dispute.

No government in Canada has had the courage to hold independent hearings into their response to the COVID crisis and learn lessons for the future. What went right and what went wrong? Were we told the truth? Did politicians, officials, and media promote and enforce a single government approved narrative, a dominant narrative, about SARS-CoV-2 and suppress alternative competing narratives based in science? If mistakes were made,
what reforms should be implemented to reduce the chance of those or similar mistakes occurring in the future?

Commissioners, at the outset, we should recognize and acknowledge the pain of those many people who lost family and friends to COVID, but we should also recognize and acknowledge the pain of so many people who have lost family and friends to the measures taken to combat COVID. You will hear evidence that these measures include the unscientific suppression of cheap and effective early treatment; deaths from loneliness, despair, and addiction caused by brutal lockdown and isolation methods borrowed from prison discipline; and the unprecedented levels of injury and death caused by experimental injectable products which did not fit the traditional definition of vaccine, and which governments still promotes.

We should also acknowledge the injuries of those who struggle with prolonged symptoms of infection injury from the injectable products and psychological injury from the campaign of fear and isolation. In the face of the COVID crisis upheaval since early 2020, it’s only reasonable that this inquiry ask the question governments don’t want to ask. Why did so many Canadians die or fall ill both from SARS-CoV-2 and from the efforts to mitigate its damage? Were our national public health responses based on the best possible evidence? And was that evolving evidence constantly re-evaluated to optimize the outcomes for the population as a whole? Were any COVID countermeasures actually counterproductive? And did they result in more harm than good? In other words, did governments use cost-benefit analysis to evaluate their actions; or were their actions, as many citizens suspect, the product of unspoken agendas for profit, power, and control?

Answers to such questions are critical to the future of Canadian democracy, to the individual rights and freedoms which sustain Canadian democracy, and to our future economic well-being. In the absence of government interest in commissioning independent public hearings, a network of volunteers from across this great country has come together out of a desire for a better Canada. The National Citizens Inquiry is entirely citizen-funded and citizen-run, and is therefore entirely independent of any government influence. You Commissioners have sworn to go where the evidence takes you and to make your findings and recommendations based on the evidence you will hear during this inquiry. And the evidence will be disturbing.

The witnesses who have come forward to this inquiry told us almost without exception that they have done so because they want to give voice to a perspective which has been ignored and suppressed in the government-sponsored narrative, enforced by mainstream media. The Commission has invited a large number of politicians, public health officials, and other leaders of the official response to the COVID crisis to appear before you and give evidence at a hearing venue convenient to them, either in person or by video link. If they fail to appear and explain to Canadians their side of the narrative, its basis in science, and why their actions were justified and continue to be justified, it will be because they do not wish to account for their actions to the citizens of Canada. It will not be because they were censored, silenced, or deplatformed by this inquiry.

If leaders of the COVID crisis response do choose to explain themselves to Canadians, they could be asked for their response to the following issue. The AstraZeneca COVID-19 vaccine program was suspended in Canada due to its risk of causing severe adverse events. The
main one was blood clotting in one in 55,000 inoculated adults—one in 55,000. Why has the same safety standard not been applied to suspend the mRNA program? Dr. Joseph Fraiman, from whom we will hear this afternoon, calculated with colleagues a one in 550 rate of serious adverse events, as revealed by reinterpretation of the clinical trial data, which is the supposed gold standard for knowledge about a new drug. The study by Dr. Fraiman was published in the prestigious journal *Vaccine* and cited by the Surgeon General of Florida in his recent letter to the FDA.

In suspending the AstraZeneca program, our regulator established a safety standard for itself for triggering suspension of a COVID injection program.

[00:10:00]

This standard was one serious adverse event in 55,000 inoculations. Peer-reviewed estimates of the serious adverse event rate for the mRNA vaccines are orders of magnitude higher than one in 55,000. Why have we failed to apply the safety standard we applied to AstraZeneca products to the mRNA injection program? The issue of the safety and efficacy of the injectable products is a leading battleground of government propaganda and a focus of mainstream media suppression of the tsunami of scientific information which contradicts government claims.

Government no longer claims that the mRNA injectable products stop infection transmission. You will hear evidence, and in fact have already heard evidence from Dr. McCullough, that these injections work by the injection of instructions to ourselves to produce a foreign protein on their surface. This foreign protein, the spike protein, is produced in unknown amounts for an unknown time and is interpreted by the body as a toxin. You will hear that the shots have tremendous quality variation in the manufacturing process. They are in fact experimental, no matter how they might be classified legally, with no medium or long-term information about their risks. You’ll hear evidence from a Canadian expert, Dr. Denis Rancourt, that these experimental injections have killed more than 10 million people worldwide—more than 10 million people worldwide. You will hear that scientific peer-reviewed literature has delivered the following verdict. An abundance of studies has shown the mRNA vaccines are neither safe nor effective, but outright dangerous—outright dangerous.

Commissioners, the life, safety, and health of our friends and family, the viability of our democracy, and our future national prosperity rest on your deliberations. The Charter of Rights and Freedoms states that Canada is founded on principles that recognize the supremacy of God and the rule of law.

God speed you in your task and may God and the rule of law prevail. Thank you.

So that’s a big task.

[00:13:06]

Ches Crosbie
Now I think we have our first witness for the day.

Criss Hochhold
Good morning, everyone, Commissioners.

Ches Crosbie
Sir, do you affirm to tell the truth, the whole truth, and nothing but the truth?

Darrell Shelley
I do. Can you hear me?

Criss Hochhold
Yes, we can hear you. Thank you. Can you please state your full name for us?

Darrell Shelley
Yes. Hi Criss, thanks for having me here today. My name is Darrell Shelley. I’m from Stephenville, Newfoundland. I relocated to Toronto in 2004, where I lived for 16 years, returning to Stephenville in December 2020, during the COVID pandemic.

Criss Hochhold
Before you moved to Newfoundland you said you resided elsewhere, can you tell me more about that? What precipitated your move to Newfoundland?
Darrell Shelley
I lived in Ontario for 16 years. I left Newfoundland as a young man, as many do, to seek employment opportunities. I ended up starting a business called Mighty Mouse Staffing, which was founded in early 2017. I was a freelance audiovisual technician in Ontario, a self-employed businessman the entire time I was up there. And after, when the COVID pandemic struck, it really took a dent in our business. We specialize in technical labour and the installation of events for producers, venues, shopping malls, public spaces, and we also provide skilled trades and construction when required. So when the live event industry shut down, it completely destroyed our business.

Criss Hochhold
Terry [sic], did you take any preventative steps to try and mitigate the potential impact of lockdowns or restrictions for your business?

Darrell Shelley
Yes, yes we did. So we ended up ordering KN95 masks, which are PPE from Asia, which is on par with the N95 masks you would get here, for what we call respirators. And we wanted those because they were supposed to keep our workers safe and we had to continue to work throughout the pandemic. So we ordered thousands of them. We got an importation license and we were ready to continue throughout the pandemic. We saw that it was coming before they had started to announce the emergencies of March 2020. So we were ordering these things about six to eight weeks before that time. When we started out in 2020, we just had peaked at what was going to be our best year ever based on contracts we were landing. We had about 20 freelancers that were working close to full time and 80 freelancers on call. We were on a gross track for over 1.5 million in 2020 from a business that started with only $1,500 of one client back in 2017.

Criss Hochhold
So you built your business from 2017 to 2020, basically from $1,500 income to a projected revenue of $1.5 million, is that right?

Darrell Shelley
That’s correct, yeah, and everything that we did was related to the event business at that time in the live event industry. So when the lockdowns happened in March, we had to tell everybody, “We’re finished for now, we’ll be back maybe in a few months.” We weren’t sure, so we held on to those KN95 masks. We just put it as a tool in our arsenal, Criss, like the same as you would with, you know, your boots, your steel-toed boots, your hard hats, or whatnot. And we figured we will get back to work at some point in time. But when June hit, we realized we weren’t going back to work. That we were going to be permanently locked out of work here. And Doug Ford, because we were Ontario, he kept calling for PPE, PPE; and they kept telling people, the public, not to buy masks, that they only needed them for the government.

Well, when the government says something like that, it makes me want to make sure that I’ve got enough for myself first. But knowing we weren’t going to need them, I had enough for my family. I had more than enough for my family and I teamed up with another friend of mine who owns a company called portable UBC and we decided to take all of our PPE and donate it to long-term care.
Because Doug Ford was calling for help with long-term care. We saw these videos on the news of people in long-term care were suffering. And if you remember the military had been called in, so we decided, “Okay, we’re going to do our part, we’re going to donate these things.” Now they were calling for procurement, and we could have made money. I said, “No it’s not the right thing to do. We’re in a pandemic. We’re all in this together, right?” That was the idea, was to help each other. So if I could help brothers and sisters and long-term care facilities get through their day, I had medical grade respirators that could help them, I was going to donate them.

And then we had a big snag when we actually decided to do that, which was the very first sign for me that there was a lot more to this pandemic that had to do with financial gain than it did to do about keeping people safe.

Criss Hochhold
Terry [sic], how many masks were you donating or looking to donate?

Darrell Shelley
So we had about 5,000 of them between us, and I had reached out to OPSEU [Ontario Public Service Employees Union], which is the union that handles long-term care facilities in Ontario. And I reached out to the president, Warren Smokey Thomas, and Eduardo Eddie Almeida, the first vice president and treasurer. They wouldn’t get back to me for the first few times. I tried calling. I tried repeated e-mails. Finally, I got a little bit aggressive with one of my e-mails, and I did get a response. Their answer was to give it to the government, at which point I said, “I’m not interested in that. I’m interested in giving them to you.” I said, “we will bring them ourselves. We have an importation license. These are legitimate. Taxes have been paid on them. Can we just bring them to you and help your people out?” And they just completely shadow-banned it. They blocked us. They didn’t want to talk to us. They ignored us. It was over. I didn’t understand why. So I went and did some investigating. I found it on their website. They were selling branded cloth masks with their logo on it, non-medical grade, to their own union employees. And that’s the only PPE they were letting them have, which weren’t going to keep them safe from the so-called virus. And here we were with medical grade respirators, an importation license, and excess of 5,000 masks that we didn’t need.

And now, on a side note, OPSU is seeking nearly $6 million that they allege that Warren Smokey Thomas and Eddie Almeida had stolen from union executives over the years. So I don’t know if they were making money off these masks, but it sure as hell put a red flag up for me, and we decided eventually to donate them to a homeless shelter called Homes First in Toronto. So we gave it to them, but it was pretty amazing that they were calling for help in long-term care. And here we were, coming to save the day, and we weren’t able to do it because they wouldn’t let us do it.

Criss Hochhold
And you were shut down from providing masks to the elderly population, particularly long-term care facilities, which were certainly a high-risk category. So thank you for that.

Terry [sic], what happened to your business? Because you said you built it up from the dream, so to speak, from very small income to a projected income of 1.5 million. And the
Darrell Shelley
So the audiovisual community and event-staffing community in the city they had these online sort of events where they were trying to rally people to— You know, let’s be all in this together and let’s stay home and let’s stay safe and all that. But after a while, after a few months, we started to see that this really wasn’t the case. Walmart was open, the liquor store was open. People down in the United States, you know, a lot of places were still open. A lot of technicians that were highly skilled moved to the United States temporarily. Some of them left the business completely. A lot of them switched trades or left the town because, I mean, living in southern Ontario near the GTA is ridiculously expensive. You need to keep making money every day or you’re going to go under, and by the time we got said and done with it, I think we managed to pick up some work in 2020. Our one and a half million projection ended up turning into about nine grand in sales from March to the year-end, and we almost lost our company.

We managed to survive because we started an online pet supply business and dog breeding business when we came back to Newfoundland called Shelley’s Pet Palace, and we were able to do that mostly online. And now in 2023, we are just starting to get Mighty Mouse Staffing back to pre-pandemic levels, and we’re hoping for a good year. But we’ve had to rebuild our entire crew and network because a lot of people have exited the business.

[00:10:00]

Which was sad because we lost a lot of really good people from that industry.

Criss Hochhold
No question of significant impact on the staffing because people would have found different trades, different avenues of revenue which may not return to the business. Certainly, a significant impact, and to go from a projection of 1.5 million to an actual recognized revenue of $9,000 is simply incredible. Were you able to regain some of the clients that you lost because of the significant reduction in your ability to provide the services?

Darrell Shelley
So thankfully, yes, we managed to keep a couple of our clients. One of them does a lot of work in shopping malls, which managed to remain open. So that little bit of work floated us during the tough years, the two tough years that just—that we just went through. But it was nowhere near what we were at before. I mean, it was literally, I had to put myself on the jobs. I had to travel back, which was quite a struggle: traveling throughout the pandemic with the various restrictions changing on a weekly basis, not knowing if we were even going to be able to travel. So I wanted to go into telling my little story about how I had to actually come home and try to take care of my mother, because getting back to the island of Newfoundland during that time was a nightmare.
Criss Hochhold
Absolutely, and Terry [sic], you've segued from the business aspect which affected you and your family, but I want to touch upon your personal story as well. You mentioned your mother, so certainly a significant life event that impacted you. Can you tell me more about that?

Darrell Shelley
Yeah, Criss, so, I mean, what proceeded—the story I'm going to tell right now probably brought me to where I am right now, my political and professional ambitions. Because I couldn't believe that this could happen on Canadian soil. I couldn't believe that this could happen in our country. So my mom was having a rough time with her health at the beginning of the year. We didn't make it home for Christmas in that previous year, so we planned to come back sometime year 2020 anyway. In May, Mom got sick.

Criss Hochhold
May of 2020?

Darrell Shelley
2020. Like really sick, more than before, and she had to stay in the hospital for a couple of weeks alone. It was really hard on her. She was unable to leave and she was only allowed one visitor, which was her designated visitor, which was her sister. During this time, my nephew was born. There were strict hospital restrictions due to the pandemic for visitation—for births as well. So my mother was unable to witness the birth of her second grandson, due to the pandemic restrictions. And the baby was not able to come see her due to the restrictions in the hospitals. I think that's when she got diagnosed with cancer, and I think it was a really lonely, difficult time for my mother. I regret that I wasn't able to be there for her at that time.

Criss Hochhold
Absolutely, I'm very sorry to hear that. How did you feel when you first learned that you weren't able to visit your mother, you know, going through such an end-of-life stage at this point in time? How would that make you feel, Terry [sic]?

Darrell Shelley
Yeah, we knew that we might be able to come home if we applied for an exemption. But in May 5th, 2020, Bill 38, an Act to amend the Public Health Protection and Promotion Act, backed by the Newfoundland government, was enacted. And this included banning non-residents from entering the province. However, residents were still able to leave and return. So if you're from Newfoundland, you can leave and go to Canada. But if you're in Canada, you can't come to Newfoundland. First time I've ever heard of anything like that ever happening. You're not allowed to go to this province, sort of, right? It allowed the police to conduct warrantless searches and contain persons who are suspected of being in contravention to the Public Health Protection and Promotion Act. To enter any premises without a warrant, to take samples, conduct tests, make copies, extracts, photographs, videos, inspect as the inspector considers necessary. And to make available any means to generate and manipulate books and records that are in the machine-readable format, such as an electronic form, or any means necessary, for the inspector to assess any books and
records and no timeline given. So they can just come into your house, take your laptop, leave, and come back three months later and say, “We found something in your laptop.”

**Criss Hochhold**

So there were some very, very trying times for us. Sorry to interrupt you, Terry [sic], but I want to focus back on your mother a little bit actually. Because you weren’t able to visit with her due to these travel restrictions that were brought in, but were you able to connect with your mother in another way potentially?

**Darrell Shelley**

Yeah, Criss. Yeah, to just correct you, it’s Darrell.

**Criss Hochhold**

Oh, I’m sorry.

**Darrell Shelley**

Yep, no problem. So yeah, like I was just about to get into—

[00:15:00]

In May 2020 the Civil Liberties Association wrote to the attorney general, Minister Andrew Parsons, concerning the restrictions put in place by the government. I sent that to my mother and I said, “You know, I don’t know if we’re going to be able to get home. I don’t know what’s going on.” So June 4th, my wife and I applied for a travel exemption into the province. And to our surprise, we did get it the next day. Taking care of someone in palliative care assistance was an option. We chose that option and we did a lot of teleconferencing, video calls with Mom. But we were really worried about traveling through the other Atlantic provinces because we heard about the difficulties that other people were having.

We didn’t know if we were going to be able to get through New Brunswick and Nova Scotia. We didn’t know if we were going to be able to even get on the boat and then they may change that last minute. So Mom was doing better through the summer and had lots of family and friends to help her as she was going through chemo. So we didn’t think it was necessary to really take the risk of trying to travel and maybe getting stopped along the way or something. So we didn’t go at the time. And then in the fall, Mom took a turn for the worse. We decided to travel home right away to take care of her full-time at that time.

Then on November 7, 2020, I had to apply for another exemption because the old one was only valid for 30 days. Now, this 30-day rule was never stated, was never made public. There was no way to know it. I had to inquire because I was going to pack up. I left my condo behind, everything behind to come home. My business was shot, so there was no work happening anyway. And this time, I applied for my entire family. We were planning to travel back on November 23. Then on November 13, I was talking to my mother with her on Messenger that day. Everything seemed fairly normal and fine. She was on the phone with her sister, I believe, that night. And sometime after midnight, she died in the kitchen. The restrictions that were put in play by the Government of Newfoundland and Labrador and the other corresponding Atlantic provinces robbed me of being able to see my mother in her dying days.
Criss Hochhold
I’m very sorry to hear that, Darrell. Absolutely. As we’re coming in towards the end, I want to ask: were you able to find some closure after all this with your mother’s passing?

Darrell Shelley
Yes and no. We weren’t sure if the exemption would be valid, but we came home anyway. At this time, after Mom passed away, there was no way for me to be able to get back to see the body to say goodbye, do a proper send-off. She had to be cremated pretty quickly. What we decided to do was to have a wake. And I knew that there was a fourteen-day isolation and I wasn’t supposed to go. Some family members said to me, “Do it anyway,” others said, “No you can’t.” So I didn’t tell anybody I was coming back and no one in town, no friends, no relatives, nobody knew of her wake. She was robbed of that. I didn’t know anything about it. I came home, got off an airplane full of people. Got into a truck completely isolated. Went to my house, completely isolated. Got in the truck went to the wake, had to put a fake name down to walk in. Went in and saw her in the empty room.

And to this day, there’s people in this town didn’t even know there was a wake. The only other person who went was my brother and his family. Nobody else was there. I didn’t even see them, because they went at a different time. People were calling me saying, “You are going to get arrested if you break the quarantine,” And I said, “My mother is dead.” I said, “I’m coming back to say goodbye to her body and we paid thousands of dollars for it. I’m going to do it.” So I set her up, it was it was mixed emotions. I was completely alone with no one there to confide in. You know, my father was very helpful by giving me his truck and everything. But the people in Newfoundland and Labrador were scared. They were totally petrified.

The amount of discrimination I felt in the next few months, traveling home, getting on that boat, and coming from Ontario, from my fellow Newfoundlander was despicable. It was ridiculous. You are talking about a person that hadn’t left his condo for almost—more than half a year. I was never sick. We weren’t working. I was isolated most of the time. All I did was went outside to walk my dog. The amount of discrimination was ridiculous. The government had everybody pitted that the outsiders were going to bring some killer plague to the island of Newfoundland. And everybody believed that this is going to happen. I heard things like, “You’re going to be the first case in Stephensville,” and, “You would affect the entire town.” When I came back—I came back on December the first, was when we finally landed, when we got over with our stuff. We quarantined for fourteen days. The last day of quarantine was my fortieth birthday. No one came to visit me on my birthday. People called and things like that but nobody came. It was my last day. Like I said we saw very little family over Christmas. It took twenty-nine days before I was able to sit down with my brother to discuss my mother’s affairs.

The government destroyed everything and had everybody living in fear. It was so sad. As people found out we were from Ontario, they would run away from us. When we couldn’t get help offloading, I couldn’t get help to offload my things. Even if I actually did it in another room by myself.

[00:20:00]

I was offering somebody two hundred dollars an hour to help me offload my stuff, after driving all the way from Ontario, getting harassed by a border guard in New Brunswick, who said I couldn’t stop. Having to take the license plates off my truck and off my trailer. It took three days to offload that stuff by myself. I had to return to my mother’s house to go
over her belongings. Same towels that she used were still hanging in the bathroom and nobody to help us. The intimidation factor was unreal, and I couldn't believe that the people of Newfoundland were so scared and convinced that we were going to bring this plague and kill everybody. It took a long time for us to be able to reconcile that as friends with our neighbors, with our families, and people [inaudible] to get back to normal.

**Criss Hochhold**

Absolutely right and then we are still reconciling with that, so thank you, Terry [sic]. We are coming short on time. I have no further questions for you. Appreciate your time and I'm going to defer to the commissioners, if there are any questions that they'd like to ask of Darrell. No?

Yes, there is one question.

**Commissioner Kaikkonen**

I'm just wondering, when it comes to the different travel regulations or guidelines in the different provinces. When you mentioned that you were harassed in New Brunswick, by the border patrol, could you just kind of elaborate a little bit further on that?

**Darrell Shelley**

Sure, yeah. It was after driving through Ontario and Quebec with no issues really. We got to the New Brunswick border at Edmundston and they had a full lockdown situation. It was almost like driving into a — I’ve traveled in Europe. I’ve gone from country to country like France to Switzerland, and other places. And when you do, there are places where they search you, and they lock you down. And you know that’s understood. It felt like that, it felt like I was going into another country. Like I was being questioned about who am I, where am I going, why am I going there and I had my papers. I said, “I’m going on back to Newfoundland,” and she said, “Well, you can’t stop along the way.” I said, “Well, if you know anybody who’s got a 5.7 litre V8 with a trailer that can drive all this distance without stopping on one tank of gas, I’ll take two trucks, thanks.”

I had my family, my puppies, a long drive, we were already tired, we weren't allowed to stop. She said, “Well, if you do stop —” I mean she pulled over other officers and they started interviewing us. And they were, like, flashing in the back of our car and looking around and trying to find out what we were doing. And they said, “If you do stop, you've got to wear a mask, you've got to put the gloves on; you can't go inside any building to use the washrooms or anything like that; you can't eat. Go straight to Newfoundland and get straight on the boat.” If anybody knows, that's a very long drive, it's hard to do it in one day. It's impossible to do with families, and puppies, and a trailer like I said. So I had to stop. I had to take the license plates off. I had to hide, I had to pay cash most of the time because I was afraid that they were going to track my Visa or my debit card. I mean this is early 2020, before they had any of the vaccine passports or anything like that, and we were terrified.

We didn't know what to do. Coming into Nova Scotia, they had flashing signs about getting ready, getting ready, and when we got there, there was nothing. We just drove right through Nova Scotia and went straight to Newfoundland. It was so bizarre. Each province had their own set of rules and again, New Brunswick was pretty intimidating. She said, “If you stop for any reason at all, we're going to send you back to where you came from.” So I would go back to Ontario where I had no home, where I had no condo, where I had no
company anymore. And I wouldn't be able to go and take care of my mother's affairs. I'd basically be homeless if they decided to turn me around, if I didn't cooperate with them.

Commissioner Kaikkonen
Thank you.

Darrell Shelley
Thank you. Thank you for what you're doing. Thank you for taking the time to listen to me today.

Criss Hochhold
Thank you, Darrell. I appreciate your time.

[00:23:38]

Witness 2: Terry Lachappelle
Full Day 2 Timestamp: 00:57:02–01:17:47
Source URL: https://rumble.com/v2djiqi-nci-truro-day-2.html

[00:00:00]

Ches Crosbie
Good morning, Mr. Lachappelle. Do you, in the testimony you will now give, affirm that you will tell the truth, the whole truth, and nothing but the truth?

Terry Lachappelle
I do.

Criss Hochhold
Good morning, Terry. I know we've already sort of mentioned it, but can you please give us your full name?

Terry Lachappelle
Yes, my name is Terry Lachappelle.

Criss Hochhold
Where do you live, Terry?

Terry Lachappelle
Right now, we live in rural New Brunswick.

Criss Hochhold
And what did you do for a living?

Terry Lachappelle
I'm a retired military veteran of 21-plus years.
Criss Hochhold
Where were you posted, Terry?

Terry Lachappelle
Six different provinces.

Criss Hochhold
Let's go with the most recent, or your last posting.

Terry Lachappelle
Right, CFB Trenton.

Criss Hochhold
Okay, so before moving to rural New Brunswick, your residence was Trenton, in Ontario?

Terry Lachappelle
Correct.

Criss Hochhold
What did you do for the military? What was your occupation or your capacity?

Terry Lachappelle
My occupation was MSE Op, Mobile Support Equipment Operator. Basically, a truck driver. I
retired in mid-2018, and I started working on the base as a civilian in— Sorry, this is a little hard
to say, but in 2020, as a public service.

Criss Hochhold
Breathe, nice and relaxed. It always helps to breathe deeply. Take a couple deep breaths,
and we'll go from there, okay?

Terry Lachappelle
I'm good.

Criss Hochhold
Excellent. Terry, you retired from the military in 2018 and then took a public service position
with the military. Correct, as a public service?

Terry Lachappelle
Yes, as a civilian.
**Criss Hochhold**
As a civilian. Okay. And then you left that job in 2020, you said?

**Terry Lachappelle**
In late 2020, yes.

**Criss Hochhold**
What precipitated that?

**Terry Lachappelle**
Well just about, you know, early 2019, early 2020, the COVID pandemic was happening. And I listened to a lot of different news outlets—not just mainstream media but also alternative news outlets. And I was hearing rumors and reading rumors about possible injection mandates for all public service employees. My wife also worked on the base as a public service employee. And I was watching that really carefully because I was worried obviously, right, what was going to happen. So between the two of us and my military pension, we were doing fine. I mean, you know, $170,000 a year, roughly. We had a couple nice vehicles, nice home, completely renovated, you know, camper, pool, hot tub for my back. Everything was going good. Until I believe in September or October, it was announced from the federal government—you can look it up; it's still on their website—that yeah, indeed, you know, no jab, no job. So you either take the injection, or you'll be placed on indeterminate leave without pay for public service employees.

**Criss Hochhold**
And this would affect both you and your spouse?

**Terry Lachappelle**
Oh, huge. You know, when you have a comfortable life and we're just starting to get used to that, and then all of a sudden, poof, it's gone. So I saw the writing on the wall. I saw the deadline. It was there in writing. So come back a bit, I knew what was going to happen. I knew what we had to do because there's no way I could afford all of that, you know.

**Criss Hochhold**
So you've made a decision. It sounds as though—and please let me know if I'm incorrect—But you said you then received documentation from the military that says if you're not vaccinated by a certain date, that your employment would effectively be terminated.

**Terry Lachappelle**
Right.

**Criss Hochhold**
But you've made a decision not to get vaccinated, is that right?
Terry Lachappelle
Correct, because a lot of red flags. I mean mRNA is nothing new. I’m sure everybody in this room has looked it up, did a little research, whatever. It’s decades-old technology.

[00:05:00]
And the first red flag to me was, why wasn’t it ever brought to market before. And then the push, the push, I mean, coercion? Really? Coercion to take something that I don’t want to take; to take a medical procedure I don’t want to undergo? You know, like, you never buy the first model Tesla. You’re going to wait till they work out some bugs first, right? And my backup plan was always, well if I’m wrong, I can always take it. You know?

Criss Hochhold
When you said coercion, can you tell me a little bit more about exactly what you mean by that?

Terry Lachappelle
Well, when the government announced that you either take it or you get placed on leave without pay for basically forever, I talked with my wife and I said, “You know, we got to sell everything. We have no choice because I can’t afford this.” A military pension isn’t very big, right? So we had to sell the house. We went down to one vehicle, sold the motorcycle, sold everything. I mean, a lot of stuff I couldn’t even take with me, the movers wouldn’t take. Luckily for us, we did make a little bit of money on the sale of the house, so that kind of tied us over for a little while. We hired some movers. We moved back to southern Ontario, back to Niagara. Ended up in a small—maybe 550 square foot—apartment on the third floor. Big difference. It’s not something I really want to wish on anybody. I mean, it might have been easy, just take it, carry on with my life but no, no.

Criss Hochhold
You felt that, based on the research you’ve conducted and the information available at the time, that it wasn’t safe for you to take to continue employment? Rather than potentially the prospect of losing your home, your vehicles, everything that you’ve built up? Because you had quite a long, lengthy career with the military.

Terry Lachappelle
Right, well, based on what I was reading—I watched a little bit of mainstream media, but I tried to stay away from it—a lot of other alternative sources. I never take anything I see online at face value. You have to kind of read between the lines, use a grocery store method, take what you need, and leave the rest behind.

The stuff I was reading was just like, wow. No, I don’t even want to take a chance on this right now, so I’m going to wait. I’m going to see what happens. Unfortunately, I didn’t have time to wait, because the date was on the wall, November 1st, and then on November 15th, you’re being placed on leave without pay. So we did what we had to do. And it was really like a punch in the face. You know, here’s an organization I worked for half my adult life. Okay, when I was in the military, I was medically released. I kind of understand that, I mean, you get to a certain point in life where you can’t do what you used to do. So yeah, I couldn’t do the soldier thing anymore. That’s fine. You know, I understand that. And there were some benefits there for me on retirement. But this, there’s just basically nothing.
They're taking away two full-time incomes and replacing it with nothing. I mean, we all know what happened with CERB [Canada Emergency Response Benefit]. I didn't even want to go near that, because I knew they'd come back to get it. It's 'the government after all, right?'

Criss Hochhold
So it sounds like your overall experience with the military up to this point has been rather favorable. You enjoyed your career with the military?

Terry Lachappelle
For the most part, ups and downs. Well, like any job, right?

Criss Hochhold
Absolutely, absolutely. But overall, it was pretty good until these mandates came into effect and then you had to make a life-altering decision. Why did you choose to move from Ontario to rural New Brunswick?

Terry Lachappelle
Well, before we moved to Niagara, we looked for an apartment in and around the Belleville, Trenton, even as far as Kingston. No way I could afford an apartment on a military pension. I mean they're eighteen hundred, two thousand dollars a month. That's basically my military pension, right? So there'd be no money for food, there'd be no money for bills, there wouldn't be anything. So we did manage to find a small apartment in Niagara that was just over a thousand dollars a month. So we rented that while we tried to figure out what we were going to do. And I contacted a veteran friend of mine in rural New Brunswick, and he said, "Hey, why don't you come and look around here? I'm sure you can find something. The prices are still reasonable." So I did. I jumped in the car. I came to New Brunswick. I looked around. I found a spot. My mortgage broker made it happen.

[00:10:00]
It was a miracle, really. So just based on my pension, we qualified for the property because I said, "There's no way this is going to be taken away from me again." You know? So any other little job that my wife could get, or I could get, or something like that, it's just a bonus, right? And that's how we ended up in New Brunswick, sixteen hundred kilometers away from my father and my brother.

Criss Hochhold
Did you have any family in New Brunswick at all?

Terry Lachappelle
I have some cousins around Sussex and St. John's, and my one veteran friend there, not too far from us. And there's other veterans in Fredericton, and I think there's a few in Moncton. That's going way back to my Army Corps days, but yeah. Everybody's so far apart out here, though. 'It's like, "I'm going to go visit, my friend, Rob. Oh wow, he's 45 minutes away!"
Criss Hochhold
Well, yes, sir, in the Maritimes, we tend to have some distances. Terry, I know you’ve talked to us, and you gave us a glimpse into your financial situation when you went from a combined income of about $170,000 a year, benefits from the federal government working for the military, to roughly $35,000 a year. And you reluctantly had to move from Ontario, where your immediate family is, to a place where you really have no immediate family, which is a significant distance away.

Terry Lachappelle
Right.

Criss Hochhold
How are you dealing with that—if I may ask—emotionally? How is your mental health because of all this as well?

Terry Lachappelle
Well, how do you deal with it? Day by day. I mean, what do you want me to say, right? You do what you got to do to get it done. My rock is over there, my wife, right?

Criss Hochhold
Absolutely. And I can appreciate that very much so. Since moving to New Brunswick, have you had contact or have you seen your immediate family, like your dad? When was the last time?

Terry Lachappelle
No, not since. It takes money to drive, you know, from New Brunswick to Ontario, and I have to do it in short hops. I almost threw my back out just driving here today. But I wanted to be here.

Criss Hochhold
I appreciate you being here.

Terry Lachappelle
Because this is so important.

Criss Hochhold
It is, absolutely.

Before moving to New Brunswick— I’m sorry to have to go there again—but not having contact with your dad, or at least a physical presence with him prior to moving to New Brunswick, how often would you spend time with your father?
**Terry Lachappelle**

Almost every day. That was really the whole pull to move there. It was one of the only places, we could afford to rent; it was also to spend time, you know, with family. Trenton is about a three-hour drive, so it’s a six-hour round trip. Being right there, I mean, I could just go knock on his door and say, “Hey come on over,” you know, “for breakfast.”

**Criss Hochhold**

Alright, so you went from a lot of contact to actually zero contact.

**Terry Lachappelle**

Zero. None.

Criss Hochhold

None at all.

Terry Lachappelle

Well, other than maybe, you know, a Facebook conversation—

**Criss Hochhold**

Right.

**Terry Lachappelle**

A video conversation or a phone conversation, yeah.

**Criss Hochhold**

But certainly, no quality time, so to speak, in person. Like you would have before, like we’d like to do with family.

**Terry Lachappelle**

Correct.

**Criss Hochhold**

Do you have any other family in Ontario that you had to move away from as well, aside from your father?

**Terry Lachappelle**

My brother, my daughter, a lot of friends, acquaintances.

**Criss Hochhold**

When was the last time you saw your daughter?
Terry Lachappelle
Last time we saw her was when we left. That would have been mid-August, roughly mid-August of last year.

Criss Hochhold
Of 2022?

Terry Lachappelle
Yeah.

Criss Hochhold
So about seven, eight months—seven months, roughly.

Terry Lachappelle
And if it wasn’t for my brother helping us move, I don’t know how I would have done it. Couldn’t afford movers, right? So U-Haul wanted $6,000 for a truck. I’m like, “no, I can’t do that.”

Criss Hochhold
After everything you went through, what I do want to know—and I think potentially the commissioners as well—is, if you had to do it over, would you reconsider? Would you take the shot?

Terry Lachappelle
Wouldn’t hesitate. I’d do the same thing all over again.

Criss Hochhold
Do the same thing.

Terry Lachappelle
Because I had no choice.

[00:15:00]

Criss Hochhold
Because earlier you mentioned coercion a bit, where your quote-unquote “choice” was take the vaccine or lose your job,

Terry Lachappelle
Right.
Criss Hochhold
That you didn’t see that as a valid choice.

Terry Lachappelle
No, that’s not a choice. That’s no choice at all. That’s, you know, that’s like me telling you, “Hey, drink this or you lose your job.” “Well, what’s in it?” “I don’t know. Just drink it!” “Well, what’s it going to do to me?” “I don’t know. Just drink it! It’s safe and effective, I promise.” You’d be like, “Yeah, I don’t think so.” I mean, what do you want me to tell you? It’s almost beyond coercion. It’s blackmail is what it is. Let’s call it what it is. Because that would be blackmail.

And the harder you tell me to do something that I don’t want to do, the more I’m going to push back. I’m that kind of guy. I’m a Taurus. It ain’t gonna happen. I will push you. And to this day, people call me an anti-vaxxer. I’ve lost friends. I’ve lost people that just don’t even want to talk to me anymore, right? I post a lot of things online, controversial things maybe. I’ve spent a lot of time in Facebook jail. I visited my daughter there a lot, too. Because, you know, that’s where they put you when you post things they don’t agree with.

Criss Hochhold
Okay, Terry, you’ve raised a very good point. And actually, I’d like to ask: you said you’re not an anti-vaxxer. Now, when you joined the military— Do you have to take vaccinations typically, when you enter the military for deployments, things of that— So have you taken any vaccines while in the military service?

Terry Lachappelle
We’ll go back to my childhood. I’ve had all my childhood vaccines. I did the needles parade right here in Cornwallis, Nova Scotia in 1985. They called it a parade, but it wasn’t really a parade: jab, jab, jab, back and forth. Before I was deployed, I couldn’t even tell you what they were. They just said, “You need to take this.” Okay. I took it. Because I knew they’re just traditional vaccines; mRNA is a messenger ribonucleic acid, I believe it’s called, and somebody can correct me if I’m wrong. It’s not a traditional vaccine. And when I was posted to Ottawa in 2012, they noticed that all my vaccinations were expired. So they said, so you need to take them all over again. “Oh, and look, you’ve never had the Hep A, B, C, D, E, F, G.” So I took all those too, without hesitation. I will put my vaccine booklet up against anybody’s in this room, any day, hands down. Hands down, I’m going to win.

Criss Hochhold
So no hesitation whatsoever for all the prescribed vaccinations within the military up until the COVID-19 came in. And based on what you’ve said to us is that there simply—I’m going to paraphrase it—but simply there wasn’t enough documentation and proof of safety for you to take a risk on an experimental vaccine. But you had no issues whatsoever taking any of the vaccinations that were required because you know they’ve been proven, and they’ve been effective, and they’ve been around. Is that correct?

Terry Lachappelle
Correct. Yep. Too many red flags.
Criss Hochhold
Thank you, Terry. I appreciate your time. I'm going to refer to the commissioners for any questions.

Commissioner Kaikkonen
I'm just wondering if there was an appeal process before the imposed deadline, if there were any other options that you could have taken?

Terry Lachappelle
Not that I'm aware of. I didn't allow them to put me on leave without pay. I just resigned. This was in mid-September. So about a month and a half before the end of October deadline.

Commissioner Kaikkonen
Thank you.

Terry Lachappelle
And just to add to that if I may. We do know people in the public service that have been placed on leave without pay. So it wasn't just something they might have done. It was done. And I personally know a lot of veterans that were released—dishonorably discharged—because they refused the COVID vaccines.

Commissioner Massie
Thank you for your testimony. I was going to ask exactly the question: In your assessment, what would be the proportion of people that refused to take the jab? According to the people you know around you in the military, for example.

Terry Lachappelle
Well, there was a number floating around of approximately 900, 800–900 military personnel that were dishonorably discharged.

[00:20:00]

And coincidentally, some of them I know personally, and they were actually called back. And they said “No,” you know, “you kicked me to the curb. I'm not coming back.” And as far as the civilians, I only know of a couple, myself personally. I don't know the numbers on the civilian population, I wasn't there very long. I was there for less than a year when all this happened, so.

Criss Hochhold
Thank you very much for your time, Terry. I'm very grateful for you being here today.

Terry Lachappelle
You're welcome. Thank you. Have a good day.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Ches Crosbie
Welcome, Peter.

Peter Van Caulart
Thank you. Good morning.

Ches Crosbie
Good morning. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Peter Van Caulart
I absolutely do.

Ches Crosbie
Thank you.

Criss Hochhold
Good morning.

Peter Van Caulart
Hi Criss.

Criss Hochhold
Can you please just repeat your full name for us.
Peter Van Caulart
My name is Peter Van Caulart. I'm a resident of Kelvin Grove, Prince Edward Island. I have been there since 2019, in November, and moved from Niagara, Ontario, to Prince Edward Island. My family and I moved because we have a business and discovered a business opportunity that was going to work for us, provided we weren't interfered with. And as everybody knows, March 11th, the interference came and it's changed our lives drastically.

Criss Hochhold
March 11th of—?

Peter Van Caulart
2020.

Criss Hochhold
Peter, you said you moved from Ontario to Prince Edward Island for business development opportunities?

Peter Van Caulart
Yeah. That's correct.

Criss Hochhold
Can you tell me more about your business, please?

Peter Van Caulart
My wife and I run a business that is a private post-secondary institution for training the people who are the professional operators running water treatment plants and wastewater treatment facilities in this country. Our work is comprised of preparing those people for their provincial examinations for recertification and initial licensing. It's the only profession that I know of that requires individuals in the profession to recertify on a cyclical period of typically three years.

Criss Hochhold
And what exactly—to make sure everyone understands what that means—do you teach them? What is the subject matter?

Peter Van Caulart
Yes. We provide the training in the physical, chemical, and biological sciences: hydraulics, the engineering, the chemistry, the biochemistry of treatment of drinking water, public drinking water, the conveyance of that drinking water in the distribution systems, the collection in the wastewater collection systems, and the ultimate treatment in the wastewater treatment facilities for final-end disposal.

Criss Hochhold
And when you say, “final-end disposal,” what does that mean?
Peter Van Caulart
Wastewater has to go back to where it came from.

Criss Hochhold
And how long have you been doing this?

Peter Van Caulart
Since 1987.

Criss Hochhold
And when you instruct, how does that typically take place?

Peter Van Caulart
The instruction largely is in-class, in-person instruction with small numbers of students. It’s somewhat boutique training, mostly hands-on because there are many skills that have to be transmitted through verbal communication and reinforcement. I’ve brought some photos that I’d like to introduce to the Commission, and I’ll hold them up and then pass them on. The first photo is a photo of me with a class of students in a laboratory doing this kind of work. The second photo is a photo of the students performing an analysis after the instruction. This is very typical, so initially we’d have a small classroom briefing, then go into the laboratory and perform the work. And, I’ve done this for over 33,000 students in the period of time that I’ve been instructing in this field.

Criss Hochhold
Incredible. Where do your students come from: All over the world? Canada? The United States?

Peter Van Caulart
We’ve had students from the United Nations Human Resources branch, from Cyprus. I’ve conducted classes in Australia. I’ve conducted training throughout Ontario, the military bases across the country, Newfoundland, Labrador, Ontario, here in Nova Scotia, Alberta, Manitoba, and British Columbia.

Criss Hochhold
You have clearly a breadth of experience. For the commissioners, those pictures that Peter held up are exhibits number TR-0009 as well as TR-0009a.

[00:05:00]

Peter, then you made a choice to move from Ontario to Prince Edward Island for those business development opportunities. Were you impacted, or was your business impacted by the lockdowns, restrictions, or government mandates?

Peter Van Caulart
The simple answer is yes, but I will elaborate. We discovered a business niche that almost compelled us to consider moving to Prince Edward Island from Ontario for several reasons. I’m getting close to the end of my career and my ability to want to keep teaching. We
discovered that we really enjoyed Prince Edward Island from frequent visits in the past. My wife and I discussed this. If we were going to settle down, this was a great place to do it. And all of the pieces worked with my insight in believing that the Maritime provinces were underserved in the level of instruction that I was able to bring, that I had been doing in Ontario for a number of years.

I ascertained that I could travel back and forth to Ontario, still maintain the business that we had there, and develop new business here in the Maritimes, particularly with the indigenous communities of the North Shore of New Brunswick. And we have made inroads and it's been great. Our reception initially when we were advertising and putting out the information that we were here was, "Oh, thank God somebody like you is here in the Maritimes"—both from the Maritime operators that I came in contact with and the people who run municipalities, who own and operate these kinds of facilities.

Criss Hochhold
Peter, what were some of your biggest challenges that you faced during those times to keep your business going? Because you said that it happens in person because you need to have access to a laboratory, so there's a lot of hands-on. So when restrictions and mandates came in, how did that impact you? And so what were those challenges that you faced?

Peter Van Caulart
You have to understand civil servants—and I don't wish to disparage all of them—but I will explain, having been one once for the Province of Ontario. There is a mentality that you must follow the group-think, and whatever is currently in favour is the thing that's going to be done. So there are lots of people who like to build empires and lots of people who like to run their own little show.

That said, many of the municipalities simply followed what was a directive from their provincial governments, which was a directive from the national government. And those facilities were deemed closed, so there was no access to drinking water facilities, there was no access to wastewater treatment facilities, the laboratories associated with them, or the people who staffed them.

Criss Hochhold
So the treatment facilities and the freshwater facilities, drinking water facilities were closed, meaning you could not provide any instruction whatsoever. How did that impact—

Peter Van Caulart
The impact was huge. Revenues essentially went from one level to zero.

Criss Hochhold
Because, as you've mentioned, this has to be done in person, so an online type of teaching is not something that's feasible.

Peter Van Caulart
Yeah, the Zoom type of instruction that many people experienced during this time simply didn't work. I teach adults. Adults, predictably, are kind of like herding cats when you get
them into a classroom. In particular, individuals who do not sit in an office on a daily basis that are active throughout a facility, maintaining, monitoring, and operating the facilities. So many of my students, the feedback that came back was, "We really don't want to play Hollywood Squares, and we prefer that — We'll wait until you can come in for live interaction and training," which is exactly what we did. In buying the time, I have to stress that I had to dissolve assets. So corporate assets, personal assets, monies we had saved for retirement, that sort of thing, was all used to try and keep our lives afloat.

**Criss Hochhold**

So in order to make ends meet, so to speak, you had no choice but to essentially shut down your business because of these mandates and restrictions.

[00:10:00]

**Peter Van Caulart**

The business essentially shut down, and I refused to take the vaccine until the last possible moment. And unfortunately, I had to take the vaccine because I was faced with an economic crisis that I didn’t want to go through.

**Criss Hochhold**

And the necessity for taking the vaccination, what was that for?

**Peter Van Caulart**

The federal government declared that nobody could travel on an aircraft without vaccines or without the injections, and I had an economic benefit that was available to me in Ontario. My own province, however, constrained me from traveling by car because I could not return back to the island unless I had been vaccinated. For all the mandates that happened everywhere else, the mandates on Prince Edward Island were even more draconian. Because basically a bunker mentality was set up on the island to prevent any sort of person from coming onto the island. And if anybody was following numbers and stats, there was a period of time when everybody was glib about the fact that we were an island. We were isolated, therefore we were very lucky and the angel of death had passed over us, and we were not going to be impacted nearly as bad as what we saw in the news in other places.

**Criss Hochhold**

How did it make you feel? Because it sounds as though, based in what you said, you had to wait until the very last minute and then you got the vaccinations simply for—simply is not is not the right word to use—but for an economic benefit. How did that make you feel?

**Peter Van Caulart**

It's the decision I most regret in my life. My wife and I both went to go and get the first shot. And I had to do it for us and for our family. She did not have to do it. And she turned to me and said, "I just, I just can't do it." And I said, "That's fine, don't do it. I completely understand it." She supported that I had to do it, but she did not agree that I should have it, and I certainly did not want to take it. I regret it, and I have done everything in my power to research the detoxification protocols that are available. And for anyone listening,
nattokinase is one of those things that's on the list. And I believe Dr. McCullough probably spoke about it yesterday. Chaga, vitamin D3, vitamin C, liposomal.

Criss Hochhold
Terry, sorry to interject, but we do have to move on, and I appreciate the seriousness and the consequence. But I'm also aware that you have—aside from a significant economic impact on you and your family—I also understand you have some personal impact with relation to a family member.

Peter Van Caulart
Correct. So in staving off the inevitable injection, for me it was not until September of 2021, I believe. I was not able to travel to my mother who was in care in Ontario. And my second biggest decision is, regrettably: I had to sign the form that required her to get her vaccine in care. I was faced with the conundrum as her medical power of attorney, that if I did not sign it, they would eject my mother from care. This is a woman in a wheelchair who could not move, and they were going to eject her from care. They were going to turn her out, and I would have to find alternative accommodation for me being in PEI, she being in Ontario. And my third photo I'm going to hold up is the photo of my dear mother, Adele [Exhibit TR-009b]. And this is a, a great photo.

But that's the last time I saw her [Exhibit TR-009c].

[00:15:00]
That was through a window at a healthcare facility in November of '20, when I was able to fly before vaccines were made available. Under the constraints that were imposed at the time, she was on a second-floor window in her room. We had an hour and a half conversation because I was fully aware that that was perhaps the last time I was going to see her for a long time. And after she had her second injection, she developed vaginal bleeding. And this is a woman in her 80s who'd never had any problem with her reproductive system whatsoever. She bore four children naturally. And to develop vaginal bleeding was curious at the most. And her wishes were carried out very quickly after her death. And I wish to hell I had insisted on an autopsy and a particular investigation as to the cause of what really killed her.

Criss Hochhold
Thank you, Terry [sic]. You said that your, once again the word, "choice" that you faced was because of your medical authority of attorney, that you had to sign for your mother to get vaccinated in the care facility. If not, she faced ejection.

Peter Van Caulart
Correct. The care facility was a not-for-profit care facility in Ontario, and the care she had received up till that time was exemplary. It was much better than many of the places my wife and I had sussed out. The year previous, we had seen horrible places. And so we were very confident that she was in the best care possible at the time. But they of course went full mandate, full blinkers on. There were no deviations from their rules. And their imposed rules: they claim they came from the government. I know that everybody claims they come from the government, but they pile on their own little twist to them. And by the time every
one of us had to deal with people who said, “You have to wear a mask here or have to show your pass there,” we all had some pretty stiff encounters with zealots.

**Criss Hochhold**
Thank you. I’ll have more questions. We are running short on time, so I think you’ve already presented a great testimony. So I will defer to the commissioners for any questions for follow-up.

**Commissioner DiGregorio**
Thank you for your testimony.

**Peter Van Caulart**
Of course, thank you for your service.

**Commissioner DiGregorio**
I just have a few clarifying questions about your business. You mentioned that you had adult students. I’m just wondering if you can tell me who a typical student would have been in your business.

**Peter Van Caulart**
Oh, certainly. All my students are adults. None of my students are directly out of college or university. They’re all people who are actively employed. As a result of their employment in this industry, the water and wastewater industry, they have to seek provincial licensing in order to continue to work in the business. That licensing is only valid unless they recertify. The recertification usually takes place every three years. They have to show a certain number of continuing education units and contact hours in order to get that recertification. In Ontario, it’s quite high. It’s a little less here in Atlantic Canada, but nonetheless, if they do not have it, they cease to be able to be employed.

**Commissioner DiGregorio**
Thank you. And one other question. I think I heard you say that one of the reasons your business became depressed in PEI was because of the closure of facilities, but that if you could travel to Ontario, you could still work. And was that something different in Ontario from PEI at that time?

**Peter Van Caulart**
No, the net kept getting tighter and tighter. Every time I made an overture to arrange something—and I had made several things work at the last minute—it was somebody within the municipality who suddenly came down with a:

[00:20:00]

“No, no, we can’t have anybody from outside our group to infiltrate and potentially infect us. And, therefore, we’re closed.”

**Commissioner DiGregorio**
Okay, thank you.

**Peter Van Caulart**
You're welcome.

**Commissioner Massie**
You alluded to the protocol that had been developed and still developing for detoxification from the vax injuries. Did you personally suffer any vax injuries?

**Peter Van Caulart**
No vax injuries, but I am grateful that I have used the knowledge and skill I have to find the things that I needed necessary to diminish whatever potential I believe is out there for a vax injury. I do question a change in my overall energy level, but I cannot conclusively say. Because part of the problem of all of what has gone on in the last three years is that everything is broken. Access to the medical system is broken. Access to get tests and confirmatory things done are broken.

I happen to be a pilot, and I've been a pilot since I was 17, and I can tell you that a two-year medical examination that was a normal course of events is no longer a normal course of events. It's a telephone conversation with a medical practitioner to get reassessed. And being a pilot, I have two major concerns. That is those pilots in this country and other places who got the vaccine: If they have a potential for some sort of vaccine injury, I have a real concern about being in the air with those pilots. And the second thing is that the pilots that didn't get the vaccine, who were furloughed for whatever reason because their airlines had mandates, or their mandates were imposed on them by the federal government, those people are the ones that you definitely want to seek out and fly with and support whatever airlines they might be with. And lastly, I think there's going to be a large amount of Canadians who when it comes time to receive or transfuse blood in medically necessary conditions: a condition about whether or not you're receiving vaccine available blood or non-vaccine available blood will be an issue as well.

**Commissioner Massie**
Thank you.

**Commissioner Drysdale**
Sorry, I have just a couple of quick questions about your mother.

**Peter Van Caulart**
Thank you.

**Commissioner Drysdale**
How long after she got the second injection did her medical condition start, and how long after did she pass away?
Peter Van Caulart
She passed away four months after the second shot. Her medical conditions occurred within three weeks of the first shot.

Commissioner Drysdale
Secondly, did you have any discussions with the medical personnel that you thought it might be a reaction to the vaccine?

Peter Van Caulart
I did. And you can probably understand what that reaction would have been. “Oh no, you can’t possibly know anything because you’re not a doctor.”

Commissioner Drysdale
So then is it safe to say that it was not registered in the CAEFISS [Canadian Adverse Events Following Immunization Surveillance] system as an adverse reaction?

Peter Van Caulart
I believe it wasn’t.

Commissioner Drysdale
Thank you.

Peter Van Caulart
You’re welcome.

Commissioner Kaikkonen
Thank you for your testimony. I just would like to ask: you refer to the PEI protocols and mandates as draconian. Could you kind of expand on that, please?

Peter Van Caulart
I don’t think I have enough time. The initial response on the island was to literally barricade the bridge, and they put up a barricade. Everybody was required to go through some sort of search procedure questioning that was, I’m going to say, literally unCanadian. Things that you’d never expect to hear or experience in Canada. These are the same kinds of questions that I answered routinely going across the border 30 years that I lived in Niagara because I was only 15 minutes from the Canadian/US border. I’m quite used to answering the nature of those kinds of questions for border security. But I never expected to experience that in PEI or New Brunswick when I once came over to New Brunswick. Because I got myself declared essential because of the nature of the work I did—and in traveling to Sydney, Nova Scotia, I can tell you that I was stopped at the border between Sydney and New Brunswick—

[00:25:00]
by a group of angry people who had been locked down, and by individuals wielding bats threatening to smash cars as a result of their reaction of being locked down at this point for over a year. The only reason I got through that roadblock was because I was declared an essential, and I explained it to the individual wielding the bat, and he acquiesced and allowed me to pass through. I was able to deliver the training in Sydney, Nova Scotia to the people who were waiting for me there. Sadly, I was only into that training two days before Nova Scotia locked down Nova Scotia, and I was required to return back to Prince Edward Island. So that training was postponed for another period of time, and I was able to go back and complete it. But almost three or four months later.

Criss Hochhold
Thank you very much, Peter. I really appreciate your time this morning.

Peter Van Caulart
Thank you. And my fellow Canadians, thank you. We're awake.

[00:26:17]
Witness 4: Amie Johnson
Full Day 2 Timestamp: 01:46:50-02:10:45

[00:00:00]

Ches Crosbie
Amie Johnson, do you affirm that you will tell the truth, the whole truth and nothing but the truth?

Amie Johnson
Yes, I do.

Alison Steeves
Good morning, Amie.

Amie Johnson
Good morning.

Alison Steeves
Can you state your full name, where you are from, and your occupation?

Amie Johnson
Sure. So my name is Amie Johnson. I'm from Chester, Nova Scotia. I am a dental hygienist, currently unemployed.

Alison Steeves
And since when have you been unemployed?

Amie Johnson
February of 2022, so just over a year.
Alison Steeves
So in February 2022, at that point, how long had you worked as a dental hygienist?

Amie Johnson
I was three months shy of 22 years.

Alison Steeves
Twenty-two years. And how do you like being a dental hygienist?

Amie Johnson
I love being a dental hygienist actually. I love interacting with people, helping them, you know, making sure that people are taking good care of their oral health, and which in turn is their overall health. It was a great profession.

Alison Steeves
Back in early 2020, were you employed as a dental hygienist at that time?

Amie Johnson
Yes, I was.

Alison Steeves
And who was your employer?

Amie Johnson
Chester Family Dental, Dr. Natasha Zink.

Alison Steeves
How long had you been at that place?

Amie Johnson
Just shy of 22 years.

Alison Steeves
So right out of school.

Amie Johnson
I went there straight out of university. Yeah, same office, same employee, same employer.

Alison Steeves
And how would you describe your experience working there up to that point?
Amie Johnson
It was great. There was ten of us, all women. We were a cohesive group. We worked together five days a week, you know, ate lunch together, went out to lunch, went out for birthdays, you know, parties, all that stuff.

Alison Steeves
I imagine being there 22 years, you would know the patients really well.

Amie Johnson
Extremely well. And you know, that's the other thing too, the patients became my friends as well, you know. Like, a lot of patients I would see every four to six months, regularly. I would see, you know, between 12 to 15 patients a day for five days a week.

Alison Steeves
How big is Chester, Nova Scotia?

Amie Johnson
Chester in the winter is about 3,000, 3,500 people. In the summer, we can go up to like 12,000 people.

Alison Steeves
Okay, so people know each other pretty well.

Amie Johnson
Yeah, we're a pretty small-knit community. We're about halfway between Halifax and Lunenburg.

Alison Steeves
So in 2020, as you begin to hear about COVID-19, were you concerned?

Amie Johnson
Initially, yes, I was. So dentistry doesn't fall under health care. So we fall more under the Nova Scotia Dental Board, and of course, for me, the Dental Hygienists Association. So in March of 2020 we were actually shut down prior to the province actually shutting down schools, and you know, the nursing homes and things like that because they were taking it very seriously. It was very unknown. They were worried about transmission. Obviously, we deal with germs, people's mouths, so you know it was pretty important to kind of figure out what was going on. And yeah, so we shut down early March and didn't reopen until June of 2020. So we were shut down for a few months there.

Alison Steeves
So that was a dental board decision?
Amie Johnson
Yes, it was.

Alison Steeves
So you would have been at home during that time?

Amie Johnson
Yes, I was.

Alison Steeves
And so when the vaccines became available, did you choose to take any of the vaccines?

Amie Johnson
No, I did not.

Alison Steeves
And why not?

Amie Johnson
Well, when they first started talking about the vaccines, on a positive note you’re thinking, okay, this is a good thing. But then you start doing your own research, and you realize, you know, COVID has a 99 per cent plus survival rate. And so something that was so rushed, the vaccine was so rushed, and experimental, I was just like, you know what? I think the previous gentleman that was up earlier said, “Let’s just wait, I’m going to hold back.” And that was kind of my initial reaction, was like, you know what, I’ll just wait, let other people take it and kind of iron out the kinks and see what’s going on. And then I quickly realized this wasn’t for me.

Alison Steeves
And what sources did you consult in making that decision?

Amie Johnson
Well, I’m a numbers person. I like statistics. So you know, initially I would, you know, check like the dash, the Nova Scotia dashboard, and Stats Canada, and even the World Health Organization, but the numbers just never seem to add up. Like these people were vaccinated, but the numbers keep getting bigger. And then the biggest red flag for me was when they put the vaccine passports in. And so the exposure sites here in Nova Scotia— We have the exposure site website, you know, don’t go there, don’t go there. And all the exposure sites are places where people that were unvaccinated couldn’t go. So how are we the problem? How are the unvaccinated the problem when the exposure sites are all vaccinated people? So I quickly realized that the vaccine doesn’t stop transmission. And from my dental standpoint, the only reason why I would take the vaccine is to protect my patients.

[00:05:00]
That I wouldn't want to transmit COVID to a patient. But if the vaccine doesn't stop transmission, what is the point of taking the vaccine, if its effectiveness for severity of disease is still questionable and doesn't stop transmission?

**Alison Steeves**
So during that time, how did you feel about the way the media was portraying COVID-19 and the vaccines?

**Amie Johnson**
Well, it's actually very disheartening. It makes you question everything that the media said over the last years: very biased, very fear mongering. Again, I worked from June of 2020 until February of 2022 through this whole pandemic. I've seen 10, 15 patients a day, and a majority of them are scared to death. And that's really sad, that they're scared of something that does have a 99 per cent survival rate. And we don't know much about the vaccine, and they're putting so much faith in the vaccine.

**Alison Steeves**
So when you made that decision not to take the vaccine, did you share that with your co-workers?

**Amie Johnson**
Absolutely. You know, at lunchtime or just in random conversations. And my co-workers weren't so receptive of that.

**Alison Steeves**
Can you describe a bit more in detail just how this decision happened?

**Amie Johnson**
Sure. At the start, when the vaccine started coming out, I would say, "No, I think you guys should hold off, wait." Because, again, dentistry doesn't fall under health care. But because we're such high exposure, we were given the opportunity to get the vaccines quite early on with the nurses and the doctors. So nine out of 10 of us were right there, the first ones in line getting the vaccine. And people were trying— My co-workers were like, "You should do it, you should do it." But then that quickly turned to, instead of just saying, "You should do it, you should do it," to anger, animosity, alienation. I would go to work just to work, and there was no more going out to lunch with my co-workers or talking to them on the weekend or, yeah.

**Alison Steeves**
Why do you think that they reacted that way? What do you think? Why were they telling you to get the vaccine, and why were they upset?

**Amie Johnson**
Well, they felt that I was not only putting my patients in danger but also them and being irresponsible. Just because I'm unvaccinated doesn't mean that I don't take my job
And did she fire you with cause, or did she pay you—?

I never went back to work after testing positive for COVID.

Amie Johnson
So you were immediately terminated.

Amie Johnson
wouldn't get vaccinated, I was no longer to work there.

and she fired me. And she said that I was putting my patients at risk, and that because I
seriously, or I don't care about my patients. But that's how they were perceiving it as, that I
was being selfish and only thinking about myself.

Alison Steeves
And you said you're no longer employed. So were there mandates?

Amie Johnson
So because I fall under the Dental Board and the Nova Scotia Dental Hygiene Association—
Both the Board and the Association did not mandate vaccines. Both, of course, were
recommending vaccines, but we were not legislated to get to get a vaccine because it didn't
stop transmission. So their official statement was the vaccine doesn’t stop transmission, so
there’s no benefit for the patient. I’m sure all of you have gone to the dentist, so you know
that we use universal precautions pre-COVID, and then those universal precautions were
only amped up even further. We had to wear gowns. We had to double mask, face shields,
goggles, you know, gloves. There were new protocols on scrubs. We would have to change
them even if we left the office even for a minute. It was very extreme. But no vaccine
mandate.

So then at Christmas, December of 2021, my employer came to me, and she officially said,
“You need to get vaccinated.” And I said, “No.” And I said, “Let’s have this discussion about
the vaccine,” And she said, “I’m not discussing it. You don’t follow the science.” And I said,
“Okay.” So then, when we came back after Christmas, because we closed for three weeks
over Christmas, one of my co-workers got sick and tested positive for COVID. And she was
triple vaxxed and was extremely sick for three weeks—very, very ill. But one of the
protocols that we did have was that, to come back to work, all of the employees had to have
negative PCR tests: to come back to work before the office reopened after my co-worker
had COVID.

So reluctantly, I went to go get my PCR test and it came back positive. I was totally
asymptomatic. I never got sick. And so when I called my employer Dr. Natasha Zink to tell
her, she was not happy obviously. But because I was unvaccinated, I had to wait the full 14
days of quarantine, even though I was asymptomatic. And at that time the protocol was
only down to a week, but because I was unvaccinated, I had to have the full two weeks off.
And so I was set to go back to work on a Monday. And a couple days later, before I was
getting ready to go back to work, she called me

[00:10:00]

and she fired me. And she said that I was putting my patients at risk, and that because I
wouldn’t get vaccinated, I was no longer to work there.

Alison Steeves
So you were immediately terminated.

Amie Johnson
I never went back to work after testing positive for COVID.

Alison Steeves
And did she fire you with cause, or did she pay you—?
**Amie Johnson**
Well, she said that first, I was putting my patients in danger. And secondly, she said there would be a shortage of work because patients wouldn’t see me because I was unvaccinated. And the hypocrisy of the whole thing is that my co-worker who had COVID was extremely ill for three weeks, was triple vaccinated, still has a job; but I’m unvaccinated and tested positive for COVID but was completely asymptomatic and I don’t have a job. After 22 years, yeah.

**Alison Steeves**
So your income ceased immediately.

**Amie Johnson**
Yes, she did pay me some sick leave for those first few days when we were waiting for the test results for the PCR test, and I did get my three weeks of vacation pay.

**Alison Steeves**
How did it feel to be let go from that position?

**Amie Johnson**
I mean, it was devastating. Like I said, you don’t work somewhere for 22 years and not love it, right? And it wasn’t a job; it was a career. It was my identity. So it was really, really hard. Really, really hard. Not to mention financially hard. I made almost $80,000 a year, and that’s a lot of money to lose in a household. It put a lot of pressure on my husband to make sure that he could pull up his socks and help more as well.

**Alison Steeves**
So since then, have you sought employment elsewhere?

**Amie Johnson**
Yes, I have. So like I said earlier, I do live in a small community. There is two other dental offices within about 15 minutes of us. So one of the offices, one of the hygienists was retiring, and I had—you know, from a friend—had heard that. So I reached out to—it’s called Chester Dental Clinic, Dr. Andrea, via email, and asking her if she would be interested in me possibly working there. And she did reply with a lovely email. I actually brought it today. But when I applied for the job, I never mentioned my vaccine status because it’s not really anyone’s business. So then, when she replied back to me, she already knew my vaccine status and would not hire me. And I have the email [Exhibit TR-26a]: would not hire me solely based on the fact that I wasn’t vaccinated. So that was one.

**Alison Steeves**
Would you like to read the email?

**Amie Johnson**
Yeah, sure I can. She says, “Thank you for reaching out to me regarding our soon-to-be-vacant dental hygienist position. I do apologize for my late response.” Because it did take
her a few days. “At this point, I am unable to offer you a position with us. Professionally, I have to consider the reality of alienating patients and staff because of your vaccination status,” which I had never told her, so I find that very interesting. “Unfortunately, Nova Scotia seems to stand alone as the world moves on. Personally, I could not disagree more with the public health protocols, having sat on the Return to Work Committee for COVID-19 on behalf of the NSDA. I am absolutely appalled at what has transpired in our once-free profession. We are beholden to ridiculous public health directives. The hypocrisy of mandating vaccines and masking in dental office defies logic, common sense and science. It did at the onset and most certainly does not presently. I admire you for your courage and your stance on personal freedoms and standing up against tyranny. I am sorry for this, that it cannot work out for us at this time. Wishing you all the best, Dr. Andrea.”

Alison Steeves
So supportive of you—

Amie Johnson
Supportive of me, but wouldn’t employ me.

Alison Steeves
And again, there were no mandates. She wasn’t required—

Amie Johnson
No, and again, Dr. Zink when she fired me, and Dr. Andrea as well. These are their sole ideas or opinions because the Dental Board does not regulate vaccinations.

Alison Steeves
And did you try—

Amie Johnson
So the third dental office in my area is Mahone Bay Dental. So in November of 2022, they had a vacancy come up. So I went in for the interview, and three days later I was offered the job via email. And she sent me the contract. We worked out all the details. I was set to start December, I think it was the 17th. And on December 10th, she called me because she heard through the grapevine that I was unvaccinated. Because during the interview, it was not discussed. During the contract that she had given me and sent to me via email, not discussed —

[00:15:00]

but she had heard that I was unvaccinated. She wanted to confirm that, and of course I’m not going to lie about my status. I’m not ashamed of it, nor embarrassed, although it is not anyone’s, you know: it’s not their business. But so she said, “If it’s true,” and I said, “Yes, it is.” And she said, “Well, I’ll still offer you the job, but I’ll put you in a three-month probationary period. And if patients will continue to see you knowing of your vaccine status, and it all works out, then I will offer you a full-time job.” And I said, “No, thank you.” And I walked away.
Alison Steeves
And why did you say, “No thank you?”

Amie Johnson
Well, first of all, again, it’s not anyone’s business what my vaccine status is. Second of all, I didn’t want to be put through that torture again. And like I said, I see 10 to 15 patients a day, not knowing, is this the patient that’s going to go to—her name is Dr. Sarah Fakhraldeen—go to Dr. Sarah, and say, “Hey, I don’t want to see her anymore because she’s unvaccinated.” So yeah, I was really reluctant to do that. So I said no. And I declined.

Alison Steeves
So you’ve worked as a dental hygienist for 22 years.

Amie Johnson
Yeah.

Alison Steeves
How long have you been in Chester?

Amie Johnson
Twenty-two years. Well, actually I grew up in Chester, but moved away for a few years, and then after, when I got my job.

Alison Steeves
And is there anywhere else in Chester you could work as a dental hygienist?

Amie Johnson
Those are the only dentist offices within a half an hour. So yeah, I’d have to start traveling. And again, I was spoiled rotten for 22 years. I walked to work.

Alison Steeves
So outside the workplace, did the vaccine passports have much of an impact on your life?

Amie Johnson
Absolutely, besides the obvious of not being able to go to the gym or the movies or restaurants and things like that. But more importantly, in my house, over that period, we missed two family funerals and two weddings.

Alison Steeves
And can you give a few more details about that?
Amie Johnson
Sure, well, one of the funerals was my husband’s uncle, who was like a father to him, who’s very special to us. Coincidentally, he did pass away within a week of his second shot, but we were unable to go to the church service. They asked my husband to be a pallbearer, but when they found out that he was unvaccinated and we were unable to go to the church service, obviously he couldn’t do that. They did have a graveside service, so we were able to go to the graveside service because it’s outside, and this was actually last February of 2022. So we did go to the graveside service, but we offended family members by going, by being present. It has created a huge rift in our family. There are family members that don’t speak to us any longer over us going to the funeral. Yeah.

Alison Steeves
So they were upset that you went to the outdoor service.

Amie Johnson
Again, you know, the misconception that just because we’re unvaccinated, we’re spreading this horrible disease to everyone, right? And it’s really sad. And you know, if you look at the numbers, people that are vaccinated are the ones getting COVID, currently. And I go back to my own experience at my work office. You know, it’s okay for a triple-vax person to get COVID, but it’s not okay for me to get COVID, or even be around people.

Alison Steeves
So would you say that the measures impacted relationships in your life?

Amie Johnson
Absolutely, it did, yeah. Yeah, unfortunately.

Alison Steeves
Do you have children?

Amie Johnson
I do, I have two children. They’re both grown. And this has in fact affected them as well, very much so. My daughter, in September of 2021, started her first year of university at Dalhousie. She was accepted into the Bachelor of Science program, the accelerated program, and within weeks of her starting, they mandated that all nursing students had to be double vaccinated. So she chose not to get vaccinated. So she left the nursing program and switched to a Bachelor of Science. And her hopes were then to be a naturopath. And shortly thereafter, Dalhousie decided that all students had to be double vaccinated, so we were kind of in a bit of a dilemma there. But then they transitioned to online learning. So she was able to do all her courses online. So we were happy with that. But then she started receiving letters coercing her, threatening her to get double vaccinated or she wouldn’t be able to complete her year at school [Exhibit TR-26]. And it turns out they came true. So she lost all of her tuition money. And she wasn’t able to get the credits.

[00:20:00]
Amie Johnson
Yeah. She wasn’t able to go to in-person to Dalhousie to write her exams. So she did the courses all year long online. And then when at the end of the term, when she came to do the exams, they wouldn’t make special accommodation for her because she was not able to be on the premises without being double vaccinated.

Alison Steeves
Would that affect her transcripts?

Amie Johnson
Yes, she did get fails, like F’s. But they said that, if you come back and take that same course again, they would replace the failure. So yeah.

And so my son and my husband, they own a construction company called Nauss and Son Construction. They were also — It was the fall of 2021; they were doing a project on an Airbnb owned by Colin and Karen McDonald in Chester. And it was a large project: they intended to be there probably about five months. They were about halfway through, and it was right before Christmas of 2021. And the manager of the property, his name is Victor Lovett, he heard apparently through the grapevine that my husband and son were unvaccinated. And he arrived on the job site, livid, irate. Kicked them off the job site, told them to take their tools and that they were fired. So you know, it’s very difficult living in a small community because everyone knows everything and the defamation of character as well that people talk behind — And my husband and son being self-employed, you know, we worry about their business. Jacqueline, my daughter, has now since opened up her own business, Coastal Charcuterie, doing charcuterie boards. And you know, she’s doing really well and really successful, but you wonder at what point sometime that might come back, again.

Alison Steeves
And Amie, I just have one final question.

Amie Johnson
Sure.

Alison Steeves
Do you regret your decision?

Amie Johnson
No, not at all. My health is far more important than any money. And again, I’m at the age that I’m approaching 50. So I was in a position that I was able to stick to my guns and my morals and make a choice for myself and my health and my family. But I feel horrible for people that are younger, or even older, that have to feel the pressure to cave to that coercion. And I’m not going to say that may be when I was in my late 20s, early 30s and had
two small kids and great big mortgage and car payments that I might have caved as well. And I was just really fortunate that I was in a position that I was able to, you know, continue to stick to my moral standards.

**Alison Steeves**

Thank you, and I'll turn it over to the commissioners if you have any questions.

**Commissioner Massie**

Well, thank you very much for your testimony. I have a question about your clinical, the dentist: Were they asking, for a patient to be treated, that they show vaccination?

**Amie Johnson**

No. At the dental office you didn’t have to be vaccinated to come. Because again, dentistry kind of falls under health care, but it doesn’t, so we did not ask people their vaccination status. And all people were treated equal.

**Commissioner Massie**

Okay, thank you.

**Alison Steeves**

Thank you, Amie.

**Amie Johnson**

Thank you.

[00:23:26]

[00:00:00]

Ches Crosbie
Good morning. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Kathy Howland
Good morning. Yes, I do.

Alison Steeves
Good morning, Kathy. Can you please tell us your full name, where you're from, and your occupation?

Kathy Howland
My name is Kathy Howland. I live in Meductic, New Brunswick, and I’m an education assistant.

Alison Steeves
How long have you been an education assistant?

Kathy Howland
Since 2018.

Alison Steeves
So approximately five years—four or five years?

Kathy Howland
Yes.
**Alison Steeves**
And what does an education assistant do?

**Kathy Howland**
I focus on primarily special education students: students with Down syndrome, autism, different learning abilities, ADHD students.

**Alison Steeves**
And you help them with the schoolwork that they’re doing in the classroom, is that it?

**Kathy Howland**
Yes.

**Alison Steeves**
And can you tell us a bit about your current position?

**Kathy Howland**
I’ve been in my current position for the past two years. I’m working currently with children that have not had a diagnosis, but they are, we are quite sure, on this spectrum of autism. And I have also had, the past couple of years, a Down Syndrome student.

**Alison Steeves**
So you were working in this position when you became eligible to take one of the COVID-19 vaccines?

**Kathy Howland**
Yes.

**Alison Steeves**
And did you take one of the vaccines?

**Kathy Howland**
I did.

**Alison Steeves**
Which one?

**Kathy Howland**
I took the Pfizer vaccine.
Alison Steeves
Do you have the batch number by any chance?

Kathy Howland
I do. It is FF5109.

Alison Steeves
And when did you take the first vaccine?

Kathy Howland
I took the first one on November 3rd, 2021.

Alison Steeves
November 3rd. And why did you choose to take the vaccine?

Kathy Howland
It really wasn’t a choice. I worked for the Province of New Brunswick, and they mandated that if I was to continue in my position as an education assistant, I would have to have the COVID shot.

Alison Steeves
Did you speak with your doctor prior to taking the vaccine?

Kathy Howland
Yes, I did.

Alison Steeves
And can you speak a bit about that conversation?

Kathy Howland
I called her and actually asked her if she could give me a letter pausing the process. At that time, I wanted to wait until the Novavax vaccine had been approved and I had read several articles that said that was going to happen. So her response to me was, “No, I can’t give you an exemption for the vaccine.” I tried to explain to her that I didn’t want an exemption. The Novavax vaccine was non-mRNA and so I just wanted to hold off until that became approved and see where that went. And her response was, “Listen, there won’t be any problem with the Pfizer shot. Just go get the damn shot.”

Alison Steeves
And how long has she been your family doctor?
Kathy Howland
She has been my doctor for probably 10-plus years.

Alison Steeves
Did you find that interaction or that behavior or treatment sort of distinct from the way you had interacted with her in the past?

Kathy Howland
It was awful. Like, I was so shocked that my only response that I had to her after that little outburst was, “Okay, then. I guess that’s where we’ll leave it.”

Alison Steeves
So she seemed upset that you were trying to delay taking the vaccine that was available to wait for another one.

Kathy Howland
Yes, yeah, she was not open to that at all.

Alison Steeves
So you went and got the shots. Do you recall who administered the vaccine to you?

Kathy Howland
Yeah, it was a pharmacist at the Guardian drugstore in Woodstock.

Alison Steeves
And did the pharmacist advise you of the potential side effects of the vaccine?

[00:05:00]

Kathy Howland
No. I asked if she had heard about any side effects. And she said, “Well, there’s just a sore arm and maybe a fever, but nothing really serious.”

Alison Steeves
Standard side effects. And did she give you an individual assessment based on your sort of personal medical history to see if the vaccine was right for you?

Kathy Howland
No.

Alison Steeves
So after you took the first shot, did you experience any symptoms?
Kathy Howland
Not really with the first shot. Just a bit of a sore arm. It was the second shot.

Alison Steeves
And when did you take your second shot?

Kathy Howland
I took my second shot on December 1st, 2021.

Alison Steeves
Okay, so almost a month later?

Kathy Howland
Yes.

Alison Steeves
Did you experience symptoms after your second shot?

Kathy Howland
Yes. I took the second one on December 1st. December 3rd, when I get up to get ready for work that morning, my ears were plugged full. My left ear was paining quite severely, and I had this awful ringing in my ears. It was so loud. And so I had to miss work that day. The following day, Saturday, December 4th, I ended up going to Emergency because of my symptoms.

Alison Steeves
So you spoke with the health care practitioner about the symptoms?

Kathy Howland
Yes.

Alison Steeves
And did they find anything?

Kathy Howland
No. He looked in my ears, he said, "I can’t see really any infection or anything." So he gave me eardrops and a nasal spray and sent me on my way.

Alison Steeves
And did your symptoms persist?
Kathy Howland
Yes.

Alison Stieves
Did you eventually get any further testing done to assess sort of what was wrong with your ears?

Kathy Howland
I did. I talked to my family doctor, and she stopped the eardrops and the nasal spray. Because when your ears are already full, she didn’t think that it was appropriate to add more to that. So then she referred me to an ENT.

Alison Stieves
Okay, and did you also get an audiology report?

Kathy Howland
I did.

Alison Stieves
Okay, and did you give me a copy of this audiology report?

Kathy Howland
I did.

Alison Stieves
Did you happen to have it in front of you?

Kathy Howland
I do.

Alison Stieves
So this is Exhibit TR-0005A?

Kathy Howland
Yes.

Alison Stieves
Perfect. Okay, and do you mind if I read from a bit of the finding here?
Alison Steeves
So it says, "Hearing sensitivity, left ear: mild to moderately severe sensorineural hearing loss, and right ear: mild to moderate sensorineural hearing loss." So stronger hearing loss in your left ear, but hearing loss in both.

Kathy Howland
Right.

Alison Steeves
So had you had an audiogram done in the past that they were able to compare this to, I assume?

Kathy Howland
I did.

Alison Steeves
So they found that you'd had some significant hearing loss in both ears. And then it also adds, "ENT consult." Did you end up seeing an ENT as you had said?

Kathy Howland
I did see an ENT.

Alison Steeves
And do you have a copy of your ENT report in front of you?

Kathy Howland
I do.

Alison Steeves
So your audiology report was January 14th, 2022. And then February 16th, 2022, you have your ENT report from River Valley ENT. Is that correct?

Kathy Howland
Right.

Alison Steeves
Okay and that's Exhibit TR-0005. And do you mind if I read from that report as well, a few excerpts?

Kathy Howland
Not at all.
Alison Steeves
So the ENT wrote, "I saw Catherine today in my otology clinic. She has an interesting
history. She had her second dose of her Pfizer COVID vaccine December 1st, 2021. Within
24 to 48 hours, she started noticing fullness, pressure, and discomfort in both ears,
worsening tinnitus, and subjective hearing loss." And speaks about your audiogram,
acknowledges the hearing loss and there is nothing else, no history or nothing, to explain it.
And then he adds, "In summary, this is a patient with bilateral sensorineural hearing loss
with left isometric sensorineural hearing loss." And adds, "This may represent a vaccine
side effect."

Is that correct?

Kathy Howland
Right. That is correct.

Alison Steeves
So you have tinnitus and hearing loss in both ears.

Kathy Howland
Yes.

Alison Steeves
And did you and your ENT discuss the potential relationship with your COVID-19 vaccine?

[00:10:00]

Kathy Howland
Yes, we did. And he said it was quite possible. But he is prevented by coming right out and
saying that. The government has stopped the doctors—apparently, from what I’ve been
able to learn—has prevented the doctors from actually attributing vaccine injuries to the
COVID-19 shots.

Alison Steeves
So he expressed that concern, that he was not permitted to directly attribute it as a cause?

Kathy Howland
Yes.

Alison Steeves
Okay, and so he put it in the report though, just as a potential effect.

Kathy Howland
Yes.
Alison Steeves
And have you spoken with your family doctor again regarding your diagnosis? You mentioned she sort of accepted there could be a link with the vaccine?

Kathy Howland
Yes, she did. She said that she had read some articles that did say that people were having problems with the vaccine and that their symptoms were hearing loss and tinnitus. But she, again, would not put that down on paper for me.

Alison Steeves
So the doctor who told you to go get the shot and not to wait for another shot that you had been waiting for was now acknowledging that you could have developed tinnitus and hearing loss based on having taken it.

Kathy Howland
Right.

Alison Steeves
Okay, so Kathy, can you speak a bit to what it’s been like living with tinnitus and hearing loss? This report was approximately a year after your second shot, a little bit more. So how has that been? How has it impacted your life?

Kathy Howland
It’s been difficult. I’ve always been a social butterfly, an extrovert, and I have completely flipped because it is so hard to be in crowds or around a group of people because I don’t hear well. Background noise is particularly annoying, so you can imagine being in my job with a classroom of children, especially elementary kids. They’re very boisterous and can be loud, and so I’ve withdrawn a lot and I’ve struggled with depression because I do miss those gatherings. I did direct a group of 30 booklists with a live band, and I can no longer do that. Because it’s just too hard to be in a room with a lot of music. It’s overwhelming, and my ears close up even more, and the tinnitus rings even louder. As far as my family goes, they don’t believe that I would actually have been hurt by a vaccine, so that’s another hurdle that’s been difficult.

Alison Steeves
So you used to be quite involved in music. You said you directed a group of music and now it’s too painful for you to be sort of surrounded by that many people in that level of noise. Is that correct?

Kathy Howland
Yeah. I can’t, I just have a hard job with it now at this point.

Alison Steeves
And how has it affected your relationships? You said family members are doubtful or skeptical?
**Kathy Howland**

Yeah, my parents are very skeptical. My sister is very skeptical. In fact, they’re just like, “Well, I mean, you’re getting older. You’re going to lose your hearing anyway.” And I’m like, “Not necessarily, I was fine.” And they just don’t want to believe that it was part of the vaccine because they’ve all had several shots.

**Alison Steeves**

And so do you feel that you can’t speak comfortably about this issue in social circles or in certain groups?

**Kathy Howland**

I can’t talk about it. No, people: they shut down. If I say anything like, “I’m sorry, I can’t hear you, I had a vaccine injury.” And I’m not going to hide behind that; I’m not going to stop with, “I’m sorry, I can’t hear you.” I want to tell people that this is what this vaccine has done to me and thousands of other people.

**Alison Steeves**

And has this experience impacted your mental health at all?

**Kathy Howland**

Yes, I have become very isolated by times. I force myself to be out in a group of people because I know what’s going to happen. The tinnitus is going to get louder. My ears are going to get stuffier.

[00:15:00]

But I don’t want to become isolated altogether because that’s not healthy either.

**Alison Steeves**

And what would you say has been the hardest aspect of this experience?

**Kathy Howland**

I think part of it is my parents not believing that I could possibly be injured by these COVID shots because they have so much faith in the government and the shots. And then another thing is my job. I love my job. I love my kids that I work with, and it’s so hard to hear their voices. And I work mostly with literacy, trying to work with the kids to bring up their literacy skills so they can do math easier, science. Anything is based on literacy, so we will want them to be right in the top drawer. But if I can’t hear whether they are saying a D, a B, a V, or a T, it’s just crushing to lose that ability to know what those kids are doing and be able to help them. I just don’t feel I can do my job as well as I did before.

**Alison Steeves**

Thank you very much, Kathy. I have no further questions, but the Commission might. I’ll just give them a minute.
Commissioner Drysdale
Thank you for your testimony. I have a couple of questions. And perhaps you said them, and I missed them. And that was, I understood that you had your second audio test in and around January 4th of 2022?

Kathy Howland
Second audio test. I’m just looking for the date here. It was the 14th of January 2022.

Commissioner Drysdale
I can’t read my own notes. There is a one there. Now my real question, though, is: what was the date of the first test, the record test you had prior to that?

Kathy Howland
I do believe that there was a previous audiogram on file from 2002, which showed normal hearing.

Commissioner Drysdale
Okay. One last question. I believe you said that you had a discussion with your family doctor with regard to this being a potential vaccine injury. And I believe I heard you say she thought that was a possible side effect?

Kathy Howland
Right. She had been reading some literature online that things were starting to come out that it was a potential side effect.

Commissioner Drysdale
Do you know whether or not she made a report to the CAEFISS [Canadian Adverse Events Following Immunization Surveillance System] system on that?

Kathy Howland
That, I don’t know. I’ve got some paperwork to go in to her next week, but I really don’t know if she reported that to VAERS [Vaccine Adverse Events Reporting System] or not.

Commissioner Drysdale
Okay. Great. Thank you very much.

Kathy Howland
You’re welcome.

Alison Steeves
Thank you, Kathy.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website: https://nationalcitizensinquiry.ca/about-these-transcripts/
Ches Crosbie
Alison Petten, thank you for attending. Do you affirm you will tell the truth, the whole truth, and nothing but the truth?

Alison Petten
Yes, I do.

Ches Crosbie
Thank you.

Nicolle Snow
Thank you. Good morning, Ms. Petten. For a little bit of background, Ms. Petten was a last-minute substitution witness, and so for that reason we are not going to go through direct examination. Ms. Petten has a story here to tell, and it’s an important story. Ms. Petten is going to be speaking on four different topics: informed consent, appropriate techniques for intramuscular injections, collection of data, and nursing standards and ethics. I'm going to let you have the floor.

Alison Petten
Okay, thank you very much. I really appreciate the opportunity to be here today. I'm here partly because I love nursing, and I get a little emotional about this. But I'll calm down once I get going. Many of my colleagues can't be here, either because they're afraid to speak publicly, or because they're exhausted, or they're at work, or maybe they're getting a break. I have had the privilege of working four streams of nursing. I've been a clinical nurse most of my career and an educator, an administrator; and I've also had some involvement with research projects and program evaluation. I currently work as an educator and health consultant. And I've been a registered nurse for 40 years—and a really good one. I love what I do and I love teaching all around Nova Scotia. I try to be kind and helpful and non-judgmental and I think, because of that, people tell me stuff. A lot of people know me in health care and I've been hearing a lot of very disturbing stories over the last few years.
I'm here because we made some serious mistakes, and we need to do better. And I know that we can. I’m not interested in furthering the blame and shame that has gone on. I think it’s important that we reflect and examine and evaluate what’s been done so that we can figure out how to do things better and not just see who’s at fault. I’m not usually a rebel. I can be a little—but not overly. I actually kind of like rules. We need policies and protocols and guidelines and laws to guide us and support us, but we need to follow them, and they also need to make sense.

So as I talk about these four things, informed consent, intramuscular injections, collecting data about possible adverse effects, and nursing and our code of ethics, I’d like to spend a little more time on nursing and the code of ethics. But I’ll try to be brief as I go along, and I invite you to help me with my time because, I know.

Nicolle Snow
I will.

Alison Petten
Yeah. And if I talk too fast, you can slow me down.

Nicolle Snow
Okay.

Alison Petten
With informed consent: I guess I would like to convey that, with 40 years in nursing, I’m blown away. To me, informed consent, I thought, was a basic foundational secure piece of the healthcare system that we weren’t allowed to mess with. For 40 years, I’m not allowed to touch people hardly. I’m not allowed to put something on someone’s body or in somebody’s body without them understanding it and choosing to accept it. Unless the person doesn’t have capacity to do so, and then there’s a process we go through with that. Information is required. When you look at the definition of informed consent, coercion is not allowed. People are not allowed to be punished for the choices that they make with healthcare. There’s not supposed to be negative repercussions for their choices. With regard to mandates, quite honestly, I never dreamed that we would do that.

And especially with the high vaccination rate that we had—with all that blame and shame and encouraging people to get vaccinated. We had a very high vaccination rate, so I’m not actually sure why they were mandated at all really. People wanted them. Before we heard messages about unvaccinated people being racist or misogynist or having unacceptable views, people want drugs. Look at the TV ads! You know, there’s new drugs out there to help you with your COPD [Chronic Obstructive Pulmonary Disease],

[00:05:00]

your breathing problems. And in order to decide you’re going to have them you’re being told that you might have headaches or high blood pressure or a heart attack or sudden death—but people have the information and they can make those choices and they sell the drugs. It happens.
We had nurses giving vaccinations to nurses who were crying because the nurses knew enough to know that we didn’t know enough about these vaccines. You couldn’t get an exemption for love nor money in this province. I only know of one individual who got an exemption, and that was after their first vaccination—after they regained consciousness several days later. We know there are a lot of people for whom this vaccine was not a good idea. The chemically sensitive, the neurologically vulnerable, and many others; but I probably shouldn’t spend much time on it because other people are. We heard doctors telling their patients, “I don’t think this vaccine is a good idea for you, but I’m not allowed to give you an exemption.” Doctors were prevented from practising medicine and providing appropriate care for individuals according to their individual situation.

Yesterday, I learned that 114 Nova Scotians died from COVID—I think in the first two years. I’m not positive, but I’m pretty sure that I could find you 114 people who either died or aren’t sure how they’re going to live because of vaccine injuries. Some of those people chose, but some of those people didn’t feel they had a choice, so it wasn’t informed consent in that case. And I think it’s interesting and very sad to see that we are noting now: we have more COVID deaths after people have had two or more vaccines. So not my area of expertise, but it does seem like maybe they aren’t working. So that’s informed consent.

I’d like to talk about the appropriate technique for intramuscular injections. I teach this stuff, and I teach to aspirate. Shall I just explain briefly what that means?

Nicolle Snow
Yes, please.

Alison Petten
So normally, when we’re giving somebody an intramuscular injection, if we’re using the deltoid, we have to make sure there’s enough muscle there that we can actually get into a muscle; we’re not going to hit bone. We landmark to find bone and the right place to inject. And then when we quickly inject the needle, we hold it steady, and we pull the plunger back just a little bit, create a little negative pressure to see if a little blood comes back into the syringe. If blood comes in the syringe, that means I’m not in muscle, I’m in a blood vessel. So I have to remove, pull the needle out, put pressure there so they don’t get a bruise and whatnot, throw that out, and then I have to draw up and landmark and inject in a different site. Because if I go ahead and give that injection, I will be giving it intravenously. And if I give a medication intravenously, usually it’s with a lower dosage. So the way these vaccines were developed and the research that was done around them was around them being given IM. So I was quite taken aback to see that in Nova Scotia and across Canada—and I understand from the CDC [Centre for Disease Control and Prevention], because I did some research to see what I could find out was happening now—they are saying it’s not necessary for vaccines.

Nicolle Snow
What is not necessary?

Alison Petten
It’s not necessary to aspirate—not necessary for vaccines. I found this out a handful of years ago because, as I said, I teach this and I want to make sure that I’m staying current and whatnot, and what I found out was there’s no research around that. The wording is
there's no evidence to support that aspiration is necessary, but there's also no evidence to support that it's not. And if I don't aspirate and I inadvertently give a medication into a vein, I could cause an overdose because we have a different dose. So for example, with morphine, if I'm giving it IM, I might give 5 to 10 milligrams. If I'm giving it IV, I give maybe a half to 2 milligrams. So it is important that we aspirate.

Maybe they're not concerned about overdosing with a vaccine, but it wasn't intended to go directly into the bloodstream. It was supposed to get there gradually, from the muscle.

[00:10:00]

And the only reason I can really think of for them wanting to do that, that would be a good reason, would be because of wiggly children. Most of the vaccines that we give go into young children. And no young child wants to have a sharp piece of metal in their body for very long. And they're wiggly. So maybe that's why, but I didn't find any rationale documented anywhere for that. It only takes a few extra seconds to aspirate. What takes longer is if you are in a vein, then you have to throw that away and draw up a new one. So you have a little bit of wastage and a little bit more time. But that's important.

Nicolle Snow
Okay. I'm going to give you the 10-minute warning.

Alison Petten
Thank you. My son wanted me to tell you that he was taught in paramedic school to aspirate. And then suddenly when they rolled out the vaccines, it doesn't matter. So he is rightly disgusted because it does matter.

With collecting data about possible adverse effects, a lot of people are talking about that in a variety of ways. So I think I will just tell you what I thought and what I expected, and it didn't happen. I first thought, uh-oh, that was fast. This is new technology. These vaccines are so new and different, they had to change the definition of "vaccine" in order for them to meet that definition. But I thought, oh my, we're in a pandemic. We have to do things differently. I suppose that we have to—and there was no talk of mandate at that point. But I thought, as long as we are collecting data about possible adverse effects and we're ready to pull the plug, I guess we have to do this. And honestly, I've known for years that we're not good at reporting adverse effects for drugs and whatnot. I think it gets reported maybe about as much as sexual assault: like, 10 per cent or less of adverse effects for drugs and vaccines actually gets reported. And this is after 40 years of nursing I know this.

I expected that we were going to do this amazing rollout of how to use the adverse event system following immunization forms. I thought they'd be on telephone poles almost. I figured every health professional in Nova Scotia—because we all are regulated—we'd have someone that can send us an email. I figured every nurse was going to get a copy of that form and be told how to use it. I figured they were going to revise the form and make it more user-friendly, make the process easier. I figured they're probably going to get the public to complete their own, because busy health professionals could be doing something else. None of that happened. And the way that it's supposed to work is we don't analyze what we submit. If there's an adverse event that happens following immunization, it's not supposed to be analyzed first. It's supposed to be submitted.
Nicolle Snow
When you say analyze, do you mean for the causal connection to the vaccine?

Alison Petten
Yes.

Nicolle Snow
You just report it regardless.

Alison Petten
We report if it’s following—yeah. And if it’s a very serious one, then they’re supposed to investigate. That’s my understanding: it’s supposed to be investigated right away if it’s serious. And if it’s not serious, then they just put it in the data, and if a pattern emerges, then they investigate. But if you don’t collect the data, you don’t get to see the pattern. And I think that’s what happens.

Nicolle Snow
Yeah.

Alison Petten
I’d like to talk a little bit about my profession. I might cry, but I’ll get over it, so just bear with me. I live and breathe my standards of practice and my code of ethics. Nursing is hard, but I love it. It’s important work and I’ve been proud to do it. Nurses are supposed to be critical thinkers. We’re supposed to have awesome knowledge, skill, and judgment. We’re not allowed to just follow orders. Leadership is expected and required of us. It says so in our standards of practice, which are legislated documents, and our code of ethics. So legislated: to me, I understand that means it’s law. This is what we’re supposed to do. We’re supposed to also work within our scope of practice, which means: as a registered nurse, I’m only allowed to do what I have the knowledge, skill, ability and judgment to safely, ethically, compassionately do for an individual or group.

Yes, most people are familiar with nurses caring for sick people and people who are injured and people who are dying, but we also are required to do health-promotion and disease-prevention as well. I expected public health education to not be just, [00:15:00]

“Stay home and wait for your vaccine and wear a mask when you go out and have distance.” I expected we would also encourage people to support their immune system—let people know, the best way to fight off a virus is to have a healthy immune system. Fear does not make your immune system stronger; it makes it weaker. We could have done things like promoted better nutrition, hydration, stress management, mindfulness, fresh air, connecting with people. We could have been checking vitamin D3 for people to see if they needed more vitamin D to be optimized. So there are a lot of things we could do: helping people to avoid sugar and alcohol, just letting them know, you know, just make other choices when you can. But instead, we were vaccine-waiting.
I want you to know that the Code of Ethics for registered nurses in Nova Scotia—I’m going
to quote from it two things. It says, “In anticipation of the need for nursing care in a disaster
or disease outbreak, nurses assist in developing a fair way to settle conflicts or disputes
regarding work exemptions or exemptions from the prophylaxis or vaccination of health
care providers.” That’s for every registered nurse in Canada. This code of ethics also says,
and I quote, “When in the midst of a disaster or a disease outbreak, nurses advocate for the
least restrictive measures possible when a person’s individual rights must be restricted.”
We didn’t do that. And I’ve given you a copy of the Code of Ethics [Exhibit TR-24].

Nicolle Snow
I do. Yeah, I do have a copy of that. Thank you. You can enter that.

Alison Petten
The Nova Scotia College of Nursing is the regulatory body for all nurses in Nova Scotia. And
I’m going to quote once again and read, if you bear with me: “In Nova Scotia, all registered
nurses and nurse practitioners are accountable to practice nursing based on that Code of
Ethics, developed by the Canadian Nurses Association. The Code of Ethics is a resource to
help you practice ethically and work through ethical challenges that arise in your practice
setting with individuals, clients, families, communities, and the health system.” That didn’t
happen either. In August 2021, I heard that there was talk of maybe mandating vaccines. So
in August 2021, I sent an email to my nursing regulator, because my understanding is that
they exist for the purpose of protecting the public from nurses. I sent them an email
basically saying, Public Health needs our help. I’m concerned that they might mandate, and
these vaccines have not had long term studies. We don’t have enough information, blah,
blah, blah. And I have given you the information.

Nicolle Snow
I have that email, which we will enter into evidence [Exhibit TR-24a]. Okay.

Alison Petten
I basically got a pat on the head. We back-and-forthed a little bit, but I was told they’re not
experimental and we’re not going to mandate. All nurses have them, but we’re going to
follow what public health says. After that, I phoned the Canadian Nurses Association,
because they are the people who have provided the code of ethics for nurses. And what
really troubled me at the time, and still, is that I phoned, because I was afraid to email. I was
somewhat afraid to have an electronic footprint just by asking some questions, and I
realized at that point that we’d really lost the ability to advocate, and yet we are required
by law to advocate.

The next thing was in February 2022. In collaboration with some other nursing colleagues,
we submitted four resolutions to the Nova Scotia College of Nursing so that we could have
some discussion. We thought maybe they’ll never get past, but at least we could have some
discussion and some debate, because that hasn’t been happening at all. The four
resolutions: One was about aspirating to avoid injecting directly into the bloodstream.
Another was about reporting adverse events. We wanted them to make sure nurses knew
they had to do that. Another was advocating to not mandate vaccines for children and
adolescents, and another was advocating to end the use of the mandates and the passports
in Nova Scotia.
We got nowhere with that. Basically, they were polite and let us know that really it would be a nursing association that would deal with such things. But in Nova Scotia we don't have an association anymore.

[00:20:00]

We just have a little bit of a Facebook page presence, but we don't— So it was like you could go there, but we didn't have "there" to go. I felt like I had exhausted what I could do through the processes that were established for nurses. I emailed and I phoned MLAs, MPs, the Governor General, the Prime Minister's Office—and I did get a couple of calls back, but more pats on the head and we'll do what public health says.

Nicolle Snow
Thank you, Ms. Petten.

Alison Petten
Could I just— Could you—?

Nicolle Snow
Yeah, you're actually out of time, but can you wrap up very quickly?

Alison Petten
Okay, I'll just quickly read this. In closing, thank you. I can't believe that we got to this in Canada. I'm trying to understand how we got here, and one of the things I think happened was it was a lot about fear. I think we need to have information and not use fear. We had processes in place to guide us, but we didn't use them. I think that was because politicians took over healthcare, and they were guided by the pharmaceutical industry, not health professionals and scientists, and leaders who developed the guidelines for just this kind of situation. Politicians are about power, and the pharmaceutical industry is about profiting. Neither is about health.

This pandemic response was managed by politicians who Canadians have allowed to have too much power. They followed recommendations by the pharmaceutical company who made too much profit and cut corners and did lousy research. This inadequately researched vaccine is now in the childhood immunization schedule in some places. I'm not sure if it's in Nova Scotia, but they were talking about that. I think politicians acted outside their scope of practice. If I did that as a nurse, I'd be in trouble. They practice healthcare without a licence. Surely that's not legal. They do not have the knowledge, skill, ability, and judgment to safely, ethically, and compassionately tell health professionals what to do, who to do it to, and how to do it. If they were nurses, I would submit a complaint to their college stating they acted outside their scope of practice.

Nicolle Snow
I'm going to stop you there to see if we have some questions from the panel. Thank you.
**Commissioner DiGregorio**
Thank you for your testimony. I had a couple of questions around your thoughts on informed consent. First of all, I'm just wondering if you've had any formal training on it. Is there anything as part of your nursing training?

**Alison Petten**
Oh, yes. Yes, in nursing school, through my diploma program, also through my baccalaureate program, and reinforced during orientation for any job that I had.

**Commissioner DiGregorio**
Thank you. And do you know if there's anything about informed consent in the nursing code of ethics that you've been talking about?

**Alison Petten**
Oh yes. Yes, it’s required. We are not allowed to provide nursing care without informed consent. And if a physician was to prescribe something that I thought was not appropriate for somebody—maybe a physician prescribed something like 100 milligrams of something, and I know this person has chronic renal failure and that’s too high a dose for them—then I’m not allowed to give it, and I’m required to question them. And if they say, “Oh, give it anyway,” then I have to go over their head.

**Commissioner DiGregorio**
Thank you. One other area you spoke about was about gathering information and adverse event reporting. Can nurses complete adverse event reports?

**Alison Petten**
My understanding is they can, but what I've seen in practice is that we typically don't. So usually it's physicians who do, but if you read the instructions online, you know any health professional is able to do it. I had assumed during the pandemic, we'd really make sure every all the nurses knew you can do that, and this is how you do it. And we made it easy for you.

**Commissioner DiGregorio**
You yourself were never asked to prepare one or you never actually prepared one?

**Alison Petten**
I did submit a couple for a couple of clients who had problems that they had reported to their doctors, and their doctors said that they weren't going to report it. And I asked the clients if they wanted me to do it for them.

**Commissioner DiGregorio**
Okay. Thank you.
**Commissioner Massie**
Maybe a quick medical question about aspiration, because I've seen a lot of recent literature on that. I was not aware of that really before. In your best, I would say, professional opinion, would you say that the lack of aspiration—in other words, the direct injection in intravenous—could be actually the source of many of the side effects that we've seen?

[00:25:00]

**Alison Petten**
In my own opinion, I think that it's possible. And I've had some other nurses share with me, they're wondering: "Do you think it's possible that with some of the things we've heard about young men and athletic young men with big biceps, they're going to have bigger blood vessels?" We're wondering, is it possible that maybe we're hitting a blood vessel and giving the vaccine directly into the bloodstream by mistake and we don't know? And then they maybe develop more of the cardiovascular problems or the sudden issues. But I don't know that. But it's something I wonder.

**Commissioner Massie**
Okay, thank you.

**Nicolle Snow**
Thank you, Ms. Petten.

[00:26:02]

[00:00:00]

**Ches Crosbie**
Elizabeth, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

**Elizabeth Cummings**
Yes, I do.

**Ches Crosbie**
Thank you.

**Nicolle Snow**
Can you state your full name?

**Elizabeth Cummings**
Yes. My name is Elizabeth Cummings.

**Nicolle Snow**
And Ms. Cummings, where do you come from today to be here?

**Elizabeth Cummings**
I come from Cole Harbor, Nova Scotia.

**Nicolle Snow**
Now I understand that you received two Pfizer shots, one in May and the other in July of 2021.
Elizabeth Cummings
Yes.

Nicolle Snow
Why did you vaccinate?

Elizabeth Cummings
I’m vaccinated because I take care of both of my elderly parents. One is ambulatory and one is not. At the time, Dr. Strang and Ian Rankin had advocated that it was proper to protect our older community by vaccinating if you were going to be around the elderly. And I absolutely, without question, took their directive and did my part.

Nicolle Snow
Did you have any adverse reactions following the first shot?

Elizabeth Cummings
No, I did not.

Nicolle Snow
And did you have any adverse reactions following the second shot?

Elizabeth Cummings
Yes, I certainly did.

Nicolle Snow
What happened?

Elizabeth Cummings
Well, the first shot was fine. It was just like a sore arm, but the second one: I had the sore arm while I was sitting there in the 15-minute time-out period. And I started to develop a headache there, and I started pressing my temples and I’m like, “Oh, that’s strange.” So I went home and by the time that evening had hit, it hit my neck and my whole head, like around the base of my neck, and it started to spread across my skull. It incapacitated me for three days. I could not move. And in addition to that headache was a nerve pain that was, surprisingly, just on the left side of my body. And it was confusing because it was literally the left side of my body.

Nicolle Snow
Do you know which arm you had the shot in?

Elizabeth Cummings
I had that in my left arm.
Nicolle Snow
Okay.

Elizabeth Cummings
So the headache, like I said, lasted for three days. And the nerve pain was constant. And then that ramped up over a couple of months. But then into the fourth day afterwards, the headache had just subsided—so thankfully that went away. And then I was given a day with just the nerve pain, and then all of a sudden, for the first time in my life, when I haven’t even had a cold sore, I developed shingles. It spread all over my neck, which you can still see some of the scar from that, and it went across my chest, and it was blistering. It was pretty bad.

What I did for that was I took my top off, and I couldn’t wear clothes. It was too uncomfortable. I washed with soap and water, peroxide, alcohol for five days, and then finally that subsided and went away. But the nerve pain continued, and I tried to deal with it myself by yoga, stretching. I knew it wasn’t normal to have that kind of nerve pain; it wasn’t a pinched nerve, because my skin—all of my skin hurt too. If I was rubbing my pants or my shirt against my skin too much, it became very raw.

Nicolle Snow
Did you see anyone for this?

Elizabeth Cummings
I looked, but you couldn’t at that time. They were taking elderly patients and they were—You couldn’t see anybody. There was nobody to see. You had to deal with it yourself, like there was not a lot of—

So then by the time October hit, I was in so much pain at that point that I went to the chiropractor. And I talked to him about it and I said, “You know, I got nerve pain but, confusingly, I’ve got skin pain too.” After about five times, I limped very badly out of the last session that I had with him. And I thought, okay, I can’t do that again. That’s not going to work. This is the fifth such session; it’s actually made things worse. Then I called my doctor that just started to take patients back, but they were only taking the elevated cases that were in-house visits.

The receptionist gave me a phone call appointment. Then, when I made the phone call appointment, my doctor said, “I can’t give you anything without giving you a physical exam because you’re talking about physical pain.” And I said, “Well, this is just the way I was directed.” Then I had to wait even longer, until November had hit. And I went in, and I talked to him about the symptoms that I was having from the vaccine, and it happened immediately. And he did acknowledge the fact that nerve pain was one of them, and he gave me a prescription for pregabalin. So I took that, then I went to a follow-up visit with him. And then at that follow-up visit, I asked for an exemption, because at that point, they started talking about boosters. And I was afraid that I was going to get a job and they were going to mandate this booster or require me to have a booster, so I wanted to be on the exemption list.
Nicolle Snow
Were you able to secure the exemption?

Elizabeth Cummings
No, I was not. He told me that—He picked up a piece of paper in his office and he said that that piece of paper said that, unless I had an overnight visit in a hospital from a side effect, I could not be put on that exemption list.

Nicolle Snow
And did you speak with him about whether or not to complete an adverse event form, or did he speak with you about that?

Elizabeth Cummings
No.

Nicolle Snow
You don't know whether he did?

Elizabeth Cummings
I didn't know what that was at that point.

Nicolle Snow
Okay, all right. And there were no indications that he filled one of those out for you?

Elizabeth Cummings
I am unaware if he did. I don't know. He does all of his little paperwork, but I don't know.

Nicolle Snow
And are you still on the pregabalin for the nerve pain?

Elizabeth Cummings
Yes, I unfortunately am in the middle of a relapse right now. Unfortunately.

Nicolle Snow
And what, if any, other measures did you take to address the concerns that you had about the vaccine?

Elizabeth Cummings
Well, the only recourse that I had at that point—I guess what happened was, I noticed in March of 2022 that there was a Pfizer dump of the safety data. So at that point, I read the cumulative 5.3.6 safety events, and I noticed—Like, I'm not a doctor, I'm just an electrician. I don't really understand much, but I do understand adverse events. And when I read that
cumulative report and I saw the nine pages of adverse events, I became very alarmed. And herpes zoster; there was also meningitis, and there were certain neuralgias. And I thought, that’s everything that happened to me—like everything! I got really, you know— I felt kind of betrayed.

What I did was, I tried to put it where I thought my complaint was supposed to go. I sent a complaint to Health Canada. Because Health Canada, if you look on their website, they have statements that they approved the Pfizer vaccine, that they deemed after a stringent—what do you call it—analysis of it, that it was safe to use. And they did that in October 2020. So I thought, that’s where I needed to go, to complain to the fact that I took two Pfizer vaccines and I became injured from the second one. What they did was they returned my email saying that I should have had a complaint with the pharmacist, because I asked the pharmacist about an insert. And the second Pfizer vaccine, I asked him if he had any information with an insert, and he said that there was no information. And they told me that I needed to contact the Nova Scotia College of Pharmacists to make a complaint, but I found that confusing because he didn’t make the insert. Like, I found that strange.

Nicolle Snow
Let’s go back to your visit with the pharmacist. Is that who administered the second dose? A pharmacist?

Elizabeth Cummings
Yes.

Nicolle Snow
You were asking the pharmacist for the insert with the ingredient list?

Elizabeth Cummings
I asked him about the safety data.

[00:10:00]

And any kind of information about the vaccine itself, because I was starting to see some alarming things online that were concerning me. And after he told me that there was no insert, I asked him what his thoughts were. And the only response he gave me was that he didn’t know whether he was going to vaccinate his 13-year-old daughter or not. So I had to make the decision then. There’s like, a 15-minute window to get your vaccination. You’re huddled in and then you’re huddled out.

Nicolle Snow
He didn’t give you any other information on possible side effects.

Elizabeth Cummings
No, no. But I did ask.
Nicolle Snow
Okay, back to your story.

Elizabeth Cummings
Fast forwarding to the complaint, because I put all of that in the complaint to Health Canada. In addition to that complaint with Health Canada, I had said that—

Nicolle Snow
Also, just to go back: Health Canada placed it back on the pharmacist to say you should have had the discussion with your pharmacist?

Elizabeth Cummings
Yes. And these are all in those documents that I had sent you in a zipped file [16 exhibits: TR-25, TR-25a through o]. Their response to that along with my complaint. But in that complaint, I had said that it was a trial vaccine, that I wasn’t given an exemption, that I bled from the PCR tests, that I was masked over and over and over again, which was harmful to me. And one of the two most important things that I put in that was that they allowed the authorization, because that’s the whole reason I went to them, was because they authorized the use in Canada. And then the last thing that I closed within the letter was informed consent. Saying, you know—and I even embedded the link to the Pfizer documents in the email—“Had I been given that information—” Because you state that you’ve reviewed this, then if I had been given this informed consent, I would not have taken that vaccine.

Then the response they gave me besides that was that I basically needed to go to VAERS [Vaccine Adverse Event Reporting System], which was the Canada Vigilance [Program], to fill out my adverse events. I was like, “Okay, I’ll do that, what is this?” So I studied it.

Nicolle Snow
Are you talking about the vaccine injury support program?

Elizabeth Cummings
The VAERS, yeah. They sent me to the Canada Vigilance VAERS. I had to figure out how to fill out that paperwork. So I did: I put in my lot number, and I put in what I was prescribed and they asked me if it was reoccurring or not. I had to put unknown because I didn’t know at that point. And then that was it. It stopped there. So there was no recourse. It was just, you’re injured, you’re done.

Then interestingly enough, July 11th came, and I noticed a Dr. Philip Oldfield had advocated that he had already talked to Dr. Tam and the Board of Physicians, I believe in Ontario, and that he was given no information. They weren’t responding to him, so he decided to elevate his complaint to the International Criminal Court. And he was asking Canadians that were injured if they would call or email the International Criminal Court and explain their injuries. I did do that. In the subject line, I put his complaint number, gave them the exact complaint that I gave to Health Canada. And I told them that I wanted to either make a complaint against— I said Health Canada, et. al., because I didn’t know who that encompassed. And I said that I wanted to add to his complaint, and if that wasn’t satisfactory, that we could make another complaint with crimes against humanity. For the
informed consent, for all the things that I had already outlined, but the vaccine-injured as well. And I had to follow up twice. I didn’t get a response from that either.

In closing, I’ve been an advocate for people that have been vaccine-injured and the people that were mandated from day one. And I think we’ve all went through a period where loss of friends— They think that we’re conspiracy theorists. And I’ve had people say to me, “Before, you know, you were a rational human being. You were—”

[00:15:00]

Nicolle Snow
Suggesting that you’re not that now.

Elizabeth Cummings
"But you’re no different than a Trumper now." And I’m like, “what does President Trump have to do with me as a Canadian? I don’t understand what the correlation is here. I’m complaining about being vaccine-injured, and you’re calling me Trump. Unacceptable."

Nicolle Snow
And so how are you doing now with respect to your condition?

Elizabeth Cummings
Well, I mean, it has its ups and downs. I had the original prescription, then I had to get it refilled. So that was December 2021. Then I had to get another prescription because I had two bottles there. Then I had to get another one in the summer. So June, July, I had to get another batch. And then just recently, I had to get another. So now, unfortunately, I’m going to have to look at this personally as something that’s chronic, that’s reoccurring. Because now it’s over a year and a half and it’s still going on. And it’s uncomfortable, it’s very uncomfortable. I can be sitting there, and the pain is just— I’ll have to get up, because if I’m still, if I’m moving in a wrong direction, it’ll inhibit me lifting. I was a robust, a very healthy individual before this. So not being able to lift 50 pounds for me, that hurts my position. I have an interview next week, and I’m worried that I’m going to have to self-disclose that I may not be able to pick up an electrical panel to drill it in the side because I can’t lift it now if I have another relapse.

So you know, everybody’s got their story and, fortunately, I’ve got my life. I know there's a lot of people that don’t.

Nicolle Snow
Yeah. Well, thank you so much for your testimony, Ms. Cummings. I’m going to turn you over to the board. They may have some questions.

Commissioners
No questions.
Nicolle Snow
All right. Thank you kindly.

**Chad Horton**
Just one moment, Dr. Fraiman. Yes, he has been affirmed. Would you like us to start over? No?

Dr. Fraiman, we had a technical difficulty a moment ago, so we’re now streaming. Can you please, for the benefit of the Commission and for our audience, provide us with a brief overview of your education, training, and experience?

**Dr. Joseph Fraiman**
My name is Dr. Joseph Fraiman. I am an emergency physician today and my medical licensing began with medical school at Cornell Medical College. I did my residency at Charity Hospital in New Orleans, Louisiana. I still work in the Louisiana region. I’m a former medical manager of the Louisiana Urban Search and Rescue Disaster Task Force. And I’m also a clinical scientist specialized in analyzing medical interventions for harm and harm benefit analysis.

**Chad Horton**
Can you just expand on that a little bit, Dr. Fraiman, where you say that you’re a clinical scientist who specializes in harm-benefit analysis. What is the background associated with that area of specialty?

**Dr. Joseph Fraiman**
That’s the area of research that I’ve been involved in since residency. I’m here today, basically, as I’m the lead author of what’s become a paper with a large impact that reanalyzed the messenger RNA COVID-19 vaccines' serious adverse events.

**Chad Horton**
Can you tell us, Dr. Fraiman, when that paper was published and who, if there are any, the co-authors might be?
**Dr. Joseph Fraiman**

Yes, there are six. We’re an international team. Some are from Spain, Australia, California. We have some in Baltimore. One of the authors is a *BMJ* editor. Another author is one of the top epidemiologists in the world. He has written a book on epidemiology. Another is a former NIH [National Institutes of Health] associate director of clinical research.

**Chad Horton**

Okay. And I understand, Dr. Fraiman, that you prepared a presentation [Exhibit TR-0011] to assist in your examination today. And if you have that ready to go, I would invite you to begin.

**Dr. Joseph Fraiman**

I do, but I need to be given a screen share option. I can start without it, as we figure out the technical here.

**Chad Horton**

One moment.

**Dr. Joseph Fraiman**

In the Emergency Department, I believe it’s important just to understand the experience that I’m given and what I’ve been witnessing through the COVID-19 pandemic. Where I work is a rural Louisiana hospital in Cajun area, which I understand is the long-lost cousins of the Acadians up north and from your region. And it’s my pleasure to have worked with them. I drive an hour and a half to work out in that region, because I really enjoy being the doctor of these patients.

March 2020, Louisiana was hit really bad with the first COVID surge, and we saw a large number of hospitalizations and death. Working in the emergency room during this period was a horrifying experience for myself and my nurses. Typically, when someone inside the hospital gets ill, there’s an emergency. At nighttime, I’m the only physician in the hospital, and I am called up to the room with something called a rapid response. It’s an automated electronic voice that comes over the loudspeaker and we have to go and resuscitate them. This happens normally once, maybe every three shifts.

[00:05:00]

that I would experience that in normal times. During COVID-19, during the first surge, we were going to these two or three times every shift. It was quite exhausting to see, emotionally, the amount of death that was occurring during this time.

But I want to point out during this time, when I was going to work, I would look at the news and see, “Oh, hospitalizations, they’re rising.” And then I would come into work and they were rising. Deaths rising. Same for cases. And then they were decreasing again. Then for the second surge, it was a very similar experience in the Emergency Department. But these metrics that we were using to count hospitalizations, I can’t say that they were accurate because I don’t know that. But I do know that, when they said they were rising, they were rising. And when they were falling, they were falling. It was almost like looking at the weather on your phone before you go outside, and it feels exactly like the weather that you just looked at on your phone. And that’s the anecdotal experience that I feel like is
important to understand. Because we see so many patients, when you see these patterns, they should fit exactly what we're being told is happening. Because we see enough patients that the anecdotal experience should match it.

**Chad Horton**
I'll tell you, Dr. Fraiman, you can screen-share now if you like. Just to contextualize some of your commentary a moment ago, you referenced the first surge and the second surge. Can you tell us when those times were? I understand your evidence is that you did see an increase in hospitalizations and deaths during what you characterized as the first surge and the second surge. When were those surges?

**Dr. Joseph Fraiman**
Yes. The first surge was March 2020. The second was in the summer, and then the third was in the winter.

**Chad Horton**
All of 2020? Yes, okay. Continue sir.

**Dr. Joseph Fraiman**
Of course, let me screen-share now. I'm here to talk about the COVID-19 vaccine, and let's begin with what we see is the randomized control trials. This is the *New England Journal of Medicine*'s publication of Pfizer's trial, and that's what I'm going to be focusing on, but the Moderna trial is very similar. We got this. This is one of the most amazing results that I've ever seen, and it's quite impressive. This is the reduction in symptomatic infections. You can see here, this blue line is the unvaccinated; and you see here, the vaccinated, they just stop getting symptomatic infections. This is an impressive finding.

But, at the time, I was actually not satisfied so much with it because I would have preferred they showed a reduction in hospitalizations, given that was, I believe, the most important concerning thing. But actually, because I've been researching with this vaccine and really going deep into this, I have found that in this study, there was a reduction in hospitalization in the original trials. It's just very difficult to find, and they don't really report on it. But if you look into this emergency use authorization, the review memorandum on page 30, and the supplementary appendix for Moderna's New England trial, *New England Journal*, you can find what the hospitalizations were. And we did see it. There were not that many hospitalizations in the placebo group, but there were zero hospitalizations in the vaccine group, and we got a hospital reduction of 2.3 for 10,000.

We're seeing what we want to see. The vaccine is reducing hospitalizations in the clinical trial.

**Chad Horton**
Dr. Fraiman, can you just get a little closer to your microphone or just project your voice a little bit more?

**Dr. Joseph Fraiman**
Yes, can you hear me better now?
Chad Horton
One moment, yeah. Go ahead, sir.

Dr. Joseph Fraiman
Okay, so here we have it for Moderna. More people were infected in the placebo group. Again, no one was hospitalized when these vaccines went for authorization.

Chad Horton
Okay, so just to help everybody understand: the slide that you just showed us, the two previous slides, where it says “vaccine zero,” that means that zero in the vaccinated group were hospitalized. And then I believe for Moderna, it was nine in the placebo group and that would mean that nine people who received placebo, the fake vaccine, did go to the hospital.

Dr. Joseph Fraiman
Yes. That’s exactly what I’m saying.

Chad Horton
Okay.

[00:10:00]

Dr. Joseph Fraiman
For death reduction, there were not enough deaths in either group to determine if it was reducing COVID-19 vaccine from COVID-19 deaths. And here you can see this is their table. It’s about equal. But then we moved into what would be called the observational data, after it was authorized. Then again, we’re seeing impressive numbers here for hospitalizations and death. Ninety-five per cent reductions essentially, all around the board. This was a pretty well-cited study.

But I also put this study up here to bring up another point, because this observational study also was heavily critiqued. Because when you do an observational study, you try to get rid of all the confounders, which are the things that are associated with the vaccine, like for example, people being older who get it. If you just compared that, you would end up with the wrong answer. So you need to control for all the different things. And for this study, they did try to do that, but they missed something. And that was the number of tests that were done. It turns out that 18 per cent of the tests were done in the vaccinated and 82 per cent were in the unvaccinated. That imbalances the groups. Now, I’m not trying to say that that means that the vaccine doesn’t work, just that that changes exactly what we’re doing. And if you adjusted for that, it would show the vaccine efficacy somewhere in the 75 to 80 per cent range. Which is still great. We’re still getting what we want to see.

But the point of this is that, generally, with observational data, after we try to attempt to identify all the things that we could adjust for, for confounding, they tend to overestimate benefits a bit. And that’s just something to think about when we start looking as the trial data—as the observational data—moves through time. So here, I just wanted to talk about what happened in the ER after the vaccine came out.
Chad Horton
Just a moment, Dr. Fraiman. When you say what happened in the ER, are you going to be speaking about your own direct observational experience?

Dr. Joseph Fraiman
Yes, my own experience. And what we saw in my hospitals was basically: after January 2021, we went months without seeing a vaccinated person have an infection or be hospitalized. It was looking very good.

I remember actually when the first vaccinated breakthrough infection occurred. And it was in April of 2021, and the whole hospital—We were all shocked to see it, the first one.

Then we all know kind of, the effects waned. Then we started the boosters. What I want to point out also is: during this time—I’m a witness in multiple hospitals—it became a little difficult to say how exactly how well the vaccine was reducing hospitalizations. There was some mis-categorization in what I was seeing, in that if a patient received a vaccine outside of the hospital system, there was a good probability they weren’t recorded as vaccinated. You could have a vaccinated person in the hospital that is being thought of as unvaccinated in the global, national way we’re counting vaccinated versus unvaccinated. It was systematically biased in that you would never have an unvaccinated person hospitalized be called a vaccinated person. The only way the mis-categorization would happen was in one direction. I don’t believe this was purposeful. I just think that this was a systematic problem. And this has been reported in in many countries that this problem occurred.

Chad Horton
Just a moment, Dr. Fraiman. Just so I can understand. You’re saying that the only way, within the system that you worked in, that somebody may be recorded as being vaccinated is if they in fact received their vaccination in the hospital, and then it would have been documented as such. Is that correct?

Dr. Joseph Fraiman
That’s not the only way. It also could be entered manually.

Chad Horton
Okay.

Dr. Joseph Fraiman
In one hospital, for a while it was difficult to enter it manually. We didn’t know how to enter it manually for several months, but eventually we learned how to enter it. But the problem is, if you are relying on this manual entering of it, then you’re going to still end up with a systematic problem unless you’re operating at perfection.

Chad Horton
Okay let me ask the question a different way, Dr. Fraiman. What sort of vaccinations may have been occurring that would not find their way into the system and database?
Dr. Joseph Faiman
Ones that were performed in tents, where they’re giving out COVID vaccines.

[00:15:00]

In New Orleans, they were giving them out in bars. There was a campaign of shots for shots and they’re giving out shots to get people to take the vaccines. And these didn’t necessarily get into the system very quickly. There wasn’t a way to put them in.

Chad Horton
Okay, so as a result of these non-recorded vaccinations, you would have patients going into the hospital and being admitted, and they would be recorded as not having been vaccinated because they may have been vaccinated in a way that wasn’t recorded, correct?

Dr. Joseph Faiman
Yeah. That’s exactly what I’m saying. I also want to be clear: I’m not saying that this shows that the vaccines weren’t working or anything like that. I’m trying to point out that we’re losing some of the reliability of the metrics of hospitalization and vaccine status.

Chad Horton
Now, to the extent that you can comment on this: What sort of proportions, if you have any awareness of this, might we be talking about between appropriately-recorded vaccine recipients versus individuals who receive the vaccine in a manner that would not have been cataloged?

Dr. Joseph Faiman
I don’t know. I’ve seen many examples of it, but it wouldn’t be possible for me to give a realistic answer.

Chad Horton
Would a significant number of the population have been receiving the vaccine outside of the hospital setting, where it wouldn’t have been recorded?

Dr. Joseph Faiman
The majority.

Chad Horton
Continue.

Dr. Joseph Faiman
Let me pull my screen-share here up a moment. Now that’s our observational stuff here through the early days. And I want to return us back to the clinical trials to look at harm. This is what we did with the study that I was referring to before. Here are my esteemed colleagues who I worked on this with, and what we did is we looked at serious adverse events.
The term “serious adverse events” was defined the same by both Pfizer and Moderna: it was death; life-threatening hospitalization; disability; or a physician considered it serious for some other reason. That’s what the large paragraph down there is. What I want to be clear is, the term “serious,” the definition is true to its nature. All of these would be a serious outcome.

To analyze this for Pfizer, for example, we had to go through the FDA [Food and Drug Administration] briefing. Also, we used the Canadian one at some point to double-check that everything was the case. This is what a table looks like here. There’s no information you glean from that, but I just want to show you this. It’s a list of each individual serious adverse event. Here is acute myocardial infarction, and the number of times it happened in each group.

Chad Horton
What is acute myocardial infarction for the layperson?

Dr. Joseph Fraiman
That’s a heart attack.

Chad Horton
Okay.

Dr. Joseph Fraiman
There’s all different types of disorders here. And we went through this whole table that goes down for pages. We simply added them up for each group: the vaccinated and the placebo.

Chad Horton
Okay, this slide here. I want to ask you a question about this, Dr. Fraiman. Here, it says any event 103 at the top. We have 103 total events. Now you were just speaking about acute myocardial infarction, and there were three. So as a layperson looking at this, am I correct in understanding that we have three acute myocardial infarctions out of 103 total events? And one event of cardiac failure, congestive one, et cetera? They all fall within the purview of those 103 events.

Dr. Joseph Fraiman
I’ll explain that 103: “any event” is the number of participants who experienced an adverse event.

Chad Horton
Okay.

Dr. Joseph Fraiman
And that’s actually where I’ll be going right now. Because if you add the number of serious adverse events—what we did here—and we found this. Where I want to focus is, we’re
going to look at the Pfizer data here. And what we see is—Actually, I want to go back here, because this is what you were talking about: we found 127 instead of 103, and 93 from the placebo. And what this difference looks like is there’s an additional 18 events per 10,000 participants in the vaccine group. And here, right here, this is called a confidence interval. That means there’s a 95 per cent certainty that it’s happening in between—

[00:20:00]

That if we did the study again, 1.2 to 34.9 events would occur per 10,000. And what that 95 per cent certainty gives us is what people would refer to as statistical significance.

Chad Horton
Okay, just a moment Dr. Fraiman. In the study, we have 18 adverse events per 10,000 vaccinations is that correct?

Dr. Joseph Fraiman
Additional events.

Chad Horton
Okay, and when you say confidence interval, you’re saying if we did that study again, that number 18 would fall with 95 per cent certainty between 1.2 and 34.9, is that correct?

Dr. Joseph Fraiman
Yes.

Chad Horton
Okay.

Dr. Joseph Fraiman
Which means that if we did the study again, we could be 95 per cent certain that we’d find an increase in serious harm. And now this risk ratio here is 36 per cent. That is a 36 per cent higher risk of serious adverse event. And that rate, the 18 per 10,000, is one in 555. So one serious event happened for every 555 people in this trial. That is quite a high number for serious adverse events from a vaccine. Typically, we have withdrawn vaccines for one in 10,000.

Chad Horton
Okay, Dr. Fraiman. Again, as a layperson: Is it one serious adverse event for 555 people vaccinated or 555 shots received?

Dr. Joseph Fraiman
People in the vaccine group.
Dr. Joseph Fraitman
People have asked us: When we did this study, what type of serious harms are we talking about? That’s quite a difficult question. Let me show you one way that we try to look at this. There’s something called these Adverse Events of Special Interest, which is a list created by this group, the Brighton Collaboration, endorsed by the WHO.

Chad Horton
And the WHO is the World Health Organization.

Dr. Joseph Fraitman
They figure out what are the adverse events that are likely to be caused by the vaccine so that we know what to look for when we’re studying it. And we took this list of these adverse events that are likely to be caused by to pay attention to, and we chose just those. This is what it ends up looking like. It’s a little confusing here, but I just wanted to show you the whole thing. I’m going to pull this together to explain it. What we see here, this is the Pfizer trial, and the differences in events per 10,000. What you see is a lot of small numbers per 10,000, but they’re all—almost all—positive. There’s only one, two negatives, a handful of zeros. Out of 15, ten are positive.

Chad Horton
What does positive and negative mean in this context?

Dr. Joseph Fraitman
Thank you. Negative would mean that they happened less in the vaccine group. For example, here they have acute liver injury that happened slightly less in the vaccine group. And we expect this to jump around all over the place, but we should expect the negatives to be about comparable to the positives. Here we’re seeing lots of small differences, all like about one in about 10,000.
Except for, here is a little higher. That's the coagulation disorder, which was higher in both Pfizer and the highest one in both Pfizer and Moderna. These include blood clotting, diseases of blood clotting, and diseases of bleeding. The reason I pulled this all together here is to show why the serious adverse events are increasing. It's not one type of harm, it's increasing in multiple different places, but very small amounts, about one in 10,000. But when you take one in 10,000, 10 times, that becomes one in a thousand.

What we're seeing here is lots of these small harms, but we are not certain exactly which ones—just that the coagulation disorders are coming up a little bit more. But we don't have power from the studies: There's not enough people, there's not enough events. But when you add them up, you can see the difference between the groups. And here we did this for both Pfizer and Moderna, and we combined them. And again, we could see when they're combined, the adverse events of special interest for Pfizer and Moderna are increased.

[00:25:00]

And here we're seeing this 12.5 in 10,000 increase, or 43 per cent increase.

**Chad Horton**
Can you go back? Can you go back to that slide for a moment? So it says mRNA vaccines and serious AESIs. What is an AESI?

**Dr. Joseph Fraiman**
Sorry, that's the adverse event of special interest. The ones that the Brighton Collaboration said created a list of the potential serious harms that we needed to basically pay attention to and potentially could be related to the vaccine.

**Chad Horton**
Okay, what this says, Table 2, serious adverse events, how I read this is: between the clinical data from Pfizer and Moderna, you are seeing 12.5 serious AESIs per 10,000 participants, is that correct?

**Dr. Joseph Fraiman**
That is correct. And that's about 1 in 800. I think we're looking at the numbers that are probably within that range. The 1 in 555 we saw: it justifies their serious adverse events. Here we're seeing 1 in 800, we're in the same range. But I think the important thing here is not just to focus on the harms. You have to put them together. And so ideally, we would have an all-cause hospitalization chart. But, as I said before, the hospitalization data wasn't really part of their study. You had to look really hard to find it, and this simply wasn't part of the study at all. It wasn't reported. It's a little unusual, but—

**Chad Horton**
What is all-cause hospitalization and why is it important?

**Dr. Joseph Fraiman**
That means if you were you hospitalized for any reason. If you're looking at a COVID-19 hospitalization, or what about a person who had a heart attack and had COVID-19. You're
not certain even if it was COVID-19 that caused it, or if the vaccine caused a heart attack. What you want to see with all-cause hospitalization is that the vaccine reduces all-cause hospitalization. Because, on the other hand, if you increase it, that means serious harms are causing hospitalizations. If you decrease all-cause hospitalization, it means the vaccine is reducing hospitalizations enough to give you that benefit that's outweighing the serious harm that it's causing.

**Chad Horton**
Understood.

**Dr. Joseph Fraiman**
Now, since that wasn’t there, we use the method that essentially creates something like that, in a way. We wanted to compare these serious adverse events of special interest with hospitalization reduction. Earlier, I showed you the hospitalization reduction was there for Pfizer. It was around 2 in 10,000. And this is what we’re seeing from the clinical trials, is that there were about 10 serious adverse events of special interest per 10,000, and hospitalization reduction was 2.3 for Pfizer, and 15 versus 6.4 for Moderna.

I know that this looks bad and scary. I don’t want people to walk away from this saying that our study proves the vaccine is causing more harm than benefit. That’s not what it’s doing.

I think it’s important to put this into context. And for that, it's to understand the limitations of what this analysis gives you, and how to interpret it. When we published this study, we received a large number of critiques. We were fact-checked by multiple fact-checking organizations, and they mainly got their sources from scientists, bloggers, and YouTube videos. These critiques, while they would say that they were debunking our article, that’s not actually the case. They were offering critique. That’s what we call that in science, a critique, which raised limitations. And we appreciated their critiques, and we incorporated them when we published initially as a preprint, and then later as a peer-reviewed publication. We incorporated these limitations, and we thought it helped us understand how to interpret this data. I think to go through them will be valuable here for you.

For example, one thing that they had said was that it’s not possible to do a proper harm-benefit analysis with only two months of data post-vaccine. I and the co-authors completely agree with that. But there’s nothing that we could have done to avoid it. That’s just the data that existed from the clinical trial.

[00:30:00]

The larger question is, if it’s not proper to do a harm-benefit analysis with only two months of data, then why did our governments decide to authorize a vaccine without the ability to do a proper harm-benefit analysis? And why is it two months not enough time? The point they were raising is that if the trial went longer, there would have been more infections. If the trial went longer, there would have been maybe a surge of COVID-19, and this would have led to more hospitalizations. They also said: if the people were sicker, if they were older, there would have been more hospitalizations.

This is all true, and it brings to the point that the hospitalization rate of their population is a big part of hospitalization reductions: the vaccine efficacy and the hospitalization rate. You need both. Now, on that limitation they point out, though: It also goes the other direction. If you have a population that’s been mostly infected, as much of our population has, you get
less hospitalizations. If you have variants such as Omicron, which cause less hospitalizations, or a variant like Omicron that has reduced vaccine efficacy because of an immune escape, the virus now knows how to get around the vaccine better than the prior strains.

That is a problem, but it shows what I'm trying to say here. It shows the fragility of that harm-benefit analysis. It can swing towards harm or benefit depending on the situation, on the hospitalization rate or the vaccine efficacy, which are changing through time. And with Omicron, we're going to return back and see what I witnessed in the emergency room.

**Chad Horton**
And when was the time frame of Omicron? Can you remind us just so we can contextualize what you're about to say?

**Dr. Joseph Fraiman**
It's about 2022, or late December 2021 is when it started. I would say about February is when it became 100 per cent the dominant strain in the United States.

**Chad Horton**
Okay.

**Dr. Joseph Fraiman**
When this occurred, we started seeing something that was a bit problematic for hospitalizations. Well, not problematic: it was great in the sense that we weren't really seeing many at all. And the last hospitalization that I've seen for COVID-19 that was a clear symptomatic case was in February of 2022. Over a year ago.

**Chad Horton**
Wait, just a moment. Dr. Fraiman, are you saying in your capacity as a physician, the last time you saw a COVID hospitalization was February of 2022?

**Dr. Joseph Fraiman**
Yes, for the one that was a clear syndrome of COVID-19. There could have been a patient who had a heart attack. Was that caused by COVID? I don't know. But it didn't look like the COVID-19 from the prior, where they had this classical syndrome where they would become very short of breath. And that's the reason we were taking them into the hospital generally.

So it could be that someone was an asthmatic, and they're having an asthma attack and they have COVID-19. It would be difficult to distinguish between the COVID-19 and the asthma attack. But what's important to understand here is, I admitted a lot of people to the hospital this year who had COVID-19. But this is incidental, most of it. And some of it could be relevant. It's difficult to tease it out. I know that this sounds crazy to some people, but all my nurses would tell you the same thing. I've asked ER doctor friends—maybe a handful of people have admitted one or two or three that are clear cases. I want to pull up this video here. Let me share my screen here with you. Can you see the video?
Dr. Joseph Fraiman
Okay, this is the CMO of Los Angeles County Hospital talking about Omicron infections [no exhibit number specified]. I believe this was in July, August:

[Video clip of Dr. Spellberg, CMO of Los Angeles County Hospital]
It’s like two months of the same. You can see LAC numbers on the graph. It’s just plateaued and it’s not going down. It’s sort of a trickle up a little bit, not much. It’s just been like that. We’re getting thousands of cases going across the county. The numbers of LAC COVID positive tests have continued to go up. But this isn’t because we’re seeing a ton of people with symptomatic disease getting admitted. On the bottom graph it’s the same thing. We’re seeing a lot of people with mild disease and urgent care needs. You could go home and do not get it.

[00:35:00]
All those who are admitted, 90 per cent of the time, are not admitted due to COVID.

Chad Horton
Okay, Dr. Fraiman. No, our audio was not great, so just a couple of things. Who was the individual who was speaking?

Dr. Joseph Fraiman
His name is Dr. Spellberg. He’s the Chief Medical Officer of L.A. County Hospital.

Chad Horton
Okay, and I’d just like you to summarize for the Commission and for the audience what that gentleman said, because our audio was quite muffled.

Dr. Joseph Fraiman
I’m sorry for that. Now, what he’s saying here, using this graph, is that during Omicron, 90 per cent of his COVID admissions were not due to COVID-19. Ninety per cent of them in his hospital: they were incidental. And he’s not alone.

Chad Horton
Okay, Dr. Fraiman, when you say incidental, am I correct in understanding that they’ve gone to the hospital for some other reason, but they just happen to be COVID positive? Is that what you mean by incidental?

Dr. Joseph Fraiman
Yes, I’ll give you an example. A person who’s missed dialysis. They come in and they need to get emergency dialysis. We test every single person who gets admitted to the hospital and a lot of them started coming back positive. Then you go back and ask the person, “Hey, do
you have a cough or anything like that?” They would answer, “Now that you say it, I do have a little sore throat.” That’s what we were seeing. It’s incidental, it’s unrelated to their hospital admission.

For incidental hospitalizations, in Denmark, they did a great job trying to figure out how many there were. It’s difficult to figure it out but their estimate was about 75 per cent. So 25 per cent to 35 per cent are actual COVID-19 in their estimates. This other hospital said 90 per cent of people who are admitted right now with COVID-19 are not actually in there for COVID-19. Now this is a disaster for our metric. The best metric to measure this vaccine’s efficacy is we need to know hospitalization rates and mortality rates. With a metric where 75 per cent to 90 per cent of them are incidental, it makes it incredibly unreliable.

The other thing that I wanted to point out is that I have also seen people with prior infections become infected again. I don’t have a memory of a prior infection being hospitalized, but it’s quite rare in general. Here we have a meta-analysis looking at this. There is about 90 per cent protection against hospitalization during Omicron. That’s 40 weeks after infection, that’s how far these studies went. The point is: it’s highly protective for a very long time and nearly our entire population has been infected at this point.

Hospitalizations during Omicron are important because we need to know the hospitalization rate, because that affects that harm-benefit analysis that we were talking about.

There’s a study out of Southern California Kaiser system. Of 4.7 million people there were 200,000 or so infections. They said, “After infection, what’s your likelihood of being hospitalized?” And they looked at Delta versus Omicron. Here’s your likelihood of Delta and here’s your likelihood with Omicron.

**Chad Horton**

All right, you’re talking about likelihoods and cumulative probability percentage on the vertical axis. Does this mean 0.5 per cent of what, or 1 per cent of what?

**Dr. Joseph Fraiman**

People who were tested positive.

**Chad Horton**

Okay so 0.5 to 2 people who tested positive for COVID-19 would be admitted to the hospital, is that correct?

**Dr. Joseph Fraiman**

Yes.

**Chad Horton**

Okay, and days on the horizontal axis is how many days post what?
I believe it's infection.

Dr. Joseph Faiman

Okay.

Chad Horton

It's a Kaplan-Meier curve, so each time that there is an infection, it makes it jump up.

Dr. Joseph Faiman

Okay, and what is the difference between the red line and the blue line?

The red line is Delta. The blue line is Omicron. So the hospitalization rate is much lower. Also keep in mind that 75 to 90 per cent of those are incidental, okay? Then when we look at the serious outcomes: ICU mechanical ventilation, mortality approaching zero, it's difficult to distinguish the two.

Now, everyone should sit back and look at this and, actually, you can smile. This is actually really great news.

But our mortality rate is difficult to discern from Omicron today.

Chad Horton

It is difficult to discern mortality from Omicron, because why?

Dr. Joseph Faiman

I'm saying it's so low. It's close to zero. People were infected with Covid 19. This is the percentage of the Omicron people who die after infection. It's very low. It's lower than Delta, much lower. It's— This is about 0.07. I think this was 0.01. I could be wrong on that, but I believe it was about a seven-fold decrease in death with Omicron in this study. And we also must look at vaccine efficacy to figure this out.

Here's one study from The Lancet. They're showing vaccine efficacy against Omicron now is around 30 per cent. I want to show just the CDC, because I think that they're considered a reliable source on this. They're saying that, at first, we're getting about 60 per cent efficacy. Over 120 days we're seeing around 29 per cent. We need to be aware of this big issue here. Twenty-nine per cent: when you get to that low of an efficacy it just becomes pretty unreliable. Remember, when I looked at the 95 per cent efficacy and I said that you if you miss one of these confounders—and you likely will—it will change results. But, if you have 95 per cent, it's okay if you drop to 75 to 80 per cent. We're still seeing a pretty large benefit. Here, if you drop, you can hit zero easily.

We're trying to figure this out in the setting of these massive number of incidental hospitalizations. We're really driving blind here, and we do not know at all how effective
these vaccines are anymore. All we do know is that, from what we were dealing with
before, when they were tested, we know that the hospitalization rates are lower. We know
that we can’t rely on it particularly well. But we do know that it’s lower and we know that
the vaccine efficacy is lower. When you have that level of uncertainty, and when we looked
at that harm-benefit analysis and how fragile it is, that creates some serious problems. We
need to take this seriously that we saw serious harm increases. It appears that they’re
happening in both trials. We’re flying blind and the differences between the harms and the
benefits are small. This is going to be impossible to figure out with observational data
moving forward. We have no chance of doing this. I believe we will remain in uncertainty.

I want to point out that people are claiming certainty: that they know the vaccine benefits
are outweighing the harm. I don’t see how that’s possible. I don’t know what metric they’re
using to measure. I just pointed out: you can’t even rely on the hospitalization data. But we
can figure this out. It’s not hopeless. There’s really one way to figure this out. We have the
tool, and we need a double-blind randomized trial to figure this out.

Chad Horton
What is a double-blind randomized clinical trial, for those of us with no medical training or
who are not research scientists?

Dr. Joseph Fraiman
This is when we randomize people to two different groups. Remember the confounding
that I was talking about? The problem with observational data is because different people
end up in different groups for various reasons. Here, you randomize them so that you get
rid of those differences. When there’s any difference between the group, you know that the
cause of it is the intervention. To use all-cause hospitalization: that would ensure, that
would make this whole process easier, so I don’t have to talk for one hour explaining how
we get this. We could just see the vaccines reducing all-cause hospitalizations. That means
it’s doing better than if it wasn’t there. Doing this currently with observational data on
hospitalizations with unreliable metrics: like I said, we’re driving blind, and we could
potentially be causing harm. We could potentially be doing benefit. I don’t know the
answer, I’m uncertain. But I know how to get the answer, and this is how we would obtain
the answer.

[00:45:00]

Until then, I would have trouble recommending the vaccine, when I don’t have a level of
certainty that I could promise to get the benefit. That’s what I really wanted to get through
here today.

Chad Horton
Before I turn you over to the panel for questioning, I have a couple of points of clarification
for myself, Dr. Fraiman. I would ask you to go back to the two slides that show instances of
harm versus benefit. And there were two slides in succession.

Dr. Joseph Fraiman
Okay, I know, from our study.
Chad Horton
Yes. Thank you. I just want to understand this correctly. So we have 10.1 adverse events of serious interest for 10,000 individuals who received the vaccine. Correct?

Dr. Joseph Fraiman
Yes. Serious adverse events.

Chad Horton
We have 2.3 individuals we believe were kept out of the hospital per 10,000 individuals who received the vaccine, correct?

Dr. Joseph Fraiman
You know, I may I have an error here. It says hospitalization reduction. It should say COVID-19 hospitalization reduction.

Chad Horton
Yeah, that’s what I understood. So is my understanding correct in that sense?

Dr. Joseph Fraiman
Yes.

Chad Horton
Okay.

Just a minute, Dr. Fraiman, I’m not finished. In the next slide, I believe, is the same analysis for Moderna, correct? Yes. Okay. And 15.1 serious adverse events risk, 15.1 events in 10,000 individuals who receive the vaccination versus—we believe—6.4 individuals per 10,000 vaccine recipients were kept out of the hospital due to COVID-19.

But what I’m understanding you saying is that these are the ratios that you were able to extract from the clinical data, but the clinical data is only based on two months of information. Correct?

Dr. Joseph Fraiman
Yes. We authorized the vaccines quickly because we saw the benefit. They were authorized and the blinding was taken away and they gave the vaccine to the placebo group. We have a very short amount of data that’s reliable.

Chad Horton
I’m going to ask you if you can comment on this or explain this to myself or the Commission or the audience. When I hear that the clinical trial was two months, and this is the result of that clinical trial, where does the determination that these products were safe and effective come from?
**Dr. Joseph Faiman**
I don’t know the origin of the term safe and effective, but it’s not a term that I would use to describe a medication.

**Chad Horton**
Would that be considered a scientific assessment?

**Dr. Joseph Faiman**
I don’t think it is. “Safe” implies that there’s no risk. Safe means that there’s no chance of harm. It doesn’t mean that harm is happening. You have to know that if something’s safe, that means you’ve studied it well and that you are certain that there is no harm from it.

**Chad Horton**
Okay.

**Dr. Joseph Faiman**
Breathing air is safe, but driving drunk is not safe. Even if you don’t crash when you drive drunk, it’s not safe. You can die. If you drive home drunk, it doesn’t mean that what you did was safe; you must know that there is no chance of risk.

**Chad Horton**
Can we objectively say, based on this admittedly flawed two months of data that we have—Because you discussed some flaws in the timing and in the methodology. And if we can extrapolate: the chance that you will sustain an adverse event of significant interest is more than twice the chance that you’ve been kept out of the hospital as a result of this Moderna injection. Is that what this table is telling me?

[00:50:00]
**Dr. Joseph Faiman**
That’s what it’s suggestive of, but I wouldn’t think of it in that way. Remember those confidence intervals. We have to think about this range of possibilities here and so it’s possible the harms are a little bit less, or it’s possible they’re a little bit more. This is just the two months of data. We’d have more if there were older people in the trial, or if it was running for longer, you could have had more hospital reduction. There’s some variability here. I wouldn’t conclude that our study is proof that you’re twice as likely to have a serious adverse event.

**Chad Horton**
Now, this data that you analyzed, was this data available to the bodies that would have been responsible for approving these vaccines?

**Dr. Joseph Faiman**
The original data that I ran through with the Pfizer data, anyone could have done. We only added the serious adverse events. We found that they were higher in the Pfizer trial.
Anyone could have done that at the time and shown that there was a 1 in 555 chance of a serious adverse event in the vaccine group. They did not analyze them in that way; they analyzed slightly differently a participant. The problem was, so you saw earlier, you saw there was 103 versus 83—and that ends up not being significantly different. You can see that here, 103 versus 81. It’s a 20 per cent increase.

But the problem is that if you experienced a serious adverse event, you were also twice as likely to experience multiple in the vaccine group. So it leads to just more events in the vaccine group. I think that anyone could agree that it’s worse to have two people have a serious adverse event than one person have two. At the same time, I think we can agree it’s worse for one person to have two serious adverse events than to have one. So these two metrics of measuring participants or number of events—they’re both important values to look at. And we did. The regulatory bodies, Pfizer and Moderna, they didn’t look at it. They didn’t count the number of events; they only counted the number of participants.

Chad Horton
Okay, Dr. Fraiman. I’m going to open you up to any questions that may be posed by the panel.

Commissioner Drysdale
Hi, Doctor. I’ve got a number of questions. I’m not a doctor, so forgive me if I don’t word it exactly right. The data that you presented to us, and not your analysis, but the data itself: Was that the data that the approval bodies had in order to arrive at an approval for this? Was this the study that was used by the authorities to approve the vaccines?

Dr. Joseph Fraiman
Yes. This is page 87 of the FDA briefing for Pfizer. It’s the advisory committee meeting for the FDA. It’s called the VRBPAC [Vaccine and Related Biological Products Advisory Committee]. This is in their page 87 in the FDA briefing for Pfizer.

Commissioner Drysdale
Understood. Some of the things that we’ve been hearing from some of the people who have testified over the last number of days is that they got a shot, they had a reaction the next day, they went to their doctor, reported the reaction and the doctor said, “Oh, that’s not in the list, that’s not associated with it.” And my question to you is, since this is a new vaccine altogether and we don’t know what the risks really were, how would that doctor in my example make a decision that it was or wasn’t caused by the vaccine? And more importantly, when I look at the list in the raw data and it lists what they felt the adverse reactions were, is that a parsed list?

[00:55:00]

And I’m not saying it was parsed for a nefarious reason. Did someone make a decision that something happened to someone but that’s not because of the vaccine, and move on?

Dr. Joseph Fraiman
In that list, if you had an event, they were blinded in the study. So if someone came into the hospital with a heart attack, you would get listed in there—no matter if they thought it was
from the vaccine or not. That’s the advantage of the double-blind trial. What you’re talking about, if the doctor is not thinking that it’s from the vaccine, they’re still supposed to report that to our system.

**Commissioner Drysdale**
Right. And if this is a double-blind trial, if someone went into the hospital with a heart attack, did they count it as an adverse reaction? Or did they say, “We don’t think that was an adverse reaction,” so they left it off? Do you know what I’m trying to say?

**Dr. Joseph Fraiman**
It would be on the list. If they had any serious event, it should be on their serious adverse event list. If it’s happening in the placebo group or in the vaccine group, it should be in both.

**Commissioner Drysdale**
Okay, I understand. And also, the slides went by a little quickly for me but we talk about adverse reactions and we talk about reduction in hospitalization. But for me, if an adverse reaction could be death, I would want that parsed out separately. Certainly, it might have reduced my hospitalization, but I’d like to know what my comparison of death as an adverse reaction versus death from being in the hospital was.

**Dr. Joseph Fraiman**
I agree. The problem is that we didn’t have the data to do that from the clinical trial. There was no difference between deaths in the groups. So yes, that would be ideal if we had a mortality benefit, or just an all-cause mortality. Are you more likely to live or die with this vaccine? That would obviously be excellent, to have that information. But we didn’t have that in the clinical trial, so we couldn’t study that.

**Commissioner Drysdale**
Circling back to where we started: we’ve got data that we don’t quite understand how we would make a safety recommendation on, with all this missing data. Safety isn’t just that a group of events happen, but the severity within the group of events. I’m an engineer, and if I were designing a building, an event might be cracked drywall. But another event might be the floor collapsed. What’s the result of grouping this all together and not understanding the severity risk or the severity of a failure? It seems to me that there was no way they could assess that.

**Dr. Joseph Fraiman**
They can in some ways, but some ways not. The serious adverse event definition is designed to kind of do that. That would be the floor collapsing. I’m sure there’s multiple other serious things that can go wrong with the building. If it got the label of serious, it was considered serious by death, hospitalization, or permanent disability. In that is a wide variation of things. One of them could be a stroke and the other one could be a bad case of diarrhea that needed to be admitted to the hospital for extra fluid. You’re still being hospitalized for it. The same is also true with COVID-19: there’s going to be a wide range of COVID-19 hospitalizations. There’ll be some mild cases that get discharged the next day; they were just admitted for observation. Then there’s some who are going to be intubated
and have a breathing tube placed. Both hospitalizations and serious adverse events have a range of badness. Their minimum is somewhat comparable in that they both should be considered serious.

[01:00:00]

**Commissioner Massie**

Thank you very much, Dr. Fraiman. I have a couple of questions regarding the ratio you came up with. Because I noticed in one of your slides and I had read that previously in your paper: when you compare the placebo from Moderna and Pfizer, it seems that, for some reason, the placebo in Moderna is about twice as high in terms of adverse events of serious interest, special interest, compared to Pfizer. Given that the numbers we’re reporting all together are about in that range, would you have any idea why there would be such a difference in the placebo between the two different clinical trials?

**Dr. Joseph Fraiman**

Yes. The whole purpose, I believe, of the randomized control trial is that we randomize it so that both groups are the same. But what looks like happened in the Moderna trial is their group was a little bit sicker, a little bit older, maybe just more fragile in one way or another. So they ended up having higher hospitalization rates for COVID-19 and they had higher overall adverse events and higher hospitalization rates from COVID-19. Which is what I think you would expect with a population that’s just a little bit more sickly. The key is that they’re randomized so that both the vaccine and the placebo in any one trial are compared. You compare the same level of fragility with the ones that got the vaccine and the placebo. That’s the advantage of a randomized trial.

**Commissioner Massie**

Coming back to the placebo, I mean, these were double-blinded random clinical trials, right?

**Dr. Joseph Fraiman**

Yes.

**Commissioner Massie**

So I’m wondering, in terms of the placebo again: in the mRNA technology, this is an emulsion because of the lipid composition of encapsulating the mRNA, and it has an appearance of somewhat opalescence compared to, say, water or saline. I’m just wondering if they use saline in the placebo, whether the people that were actually doing the injection couldn’t be aware that in one case it was the placebo and the other case it was the vaccine? Do you have any information on that? Because I haven’t seen anything.

**Dr. Joseph Fraiman**

There is. I believe what you’re pointing out is, was there unblinding in the trial? And did the people who got vaccinated realize they got the vaccine and did the placebo realize they got the placebo? Is that what you’re asking?
**Commissioner Massie**

Yeah, I’m asking because saline is very different from the vaccine itself. If you look at the bottle, it’s pretty obvious.

**Dr. Joseph Faiman**

Yes. It’s reported that people in the vaccine trial were also in Facebook groups together. They were all talking to each other. We know that, after the COVID-19 vaccine, over half of people get pretty serious, severe symptoms like fevers and headaches and they feel lousy. A lot of people can’t go to work the next day. The people who got the vaccine felt that and the people who got the placebo didn’t. And it seems like from their messages in Facebook groups that probably a lot of them did sort of know which group they were in. Which is bad. That is a problem for unblinding, but it’s still the best that we got for understanding these vaccines. I agree that could complicate it for interpretation of the data.

**Commissioner Massie**

Maybe one last question to wrap it up. Given the level of data that the regulatory agency was exposed to in order to make a decision, and when you looked at the overall benefit or advantage of the vaccine and the potential for serious adverse reaction: Was there enough data to really put forward the vaccination campaign, given that we don’t know about what would happen even in six months or one year from now? Because at this point the data was two months. So if you go with the precautionary principle, with that part of the equation in terms of recommending to go ahead with vaccination, and still today, to promote the vaccination in the Omicron phase—?

[01:05:00]

**Dr. Joseph Faiman**

I think that, at that time, there was a difficult decision that had to be made. The emergency use authorization was given at the time because of the seriousness of the pandemic that was going on. There were some chances that were taken by approving it early, before we had all that data, because there was a hope that it was going to save lives. I think at the time it was a difficult decision probably to make.

In 20/20 hindsight, I know for sure that I would very much have liked a better clinical trial to know what’s going on. It may have been short-sighted to get the vaccine authorized and then realize we are now stuck in this pool of uncertainty on this vaccine. There are some different ways that things could have gone. I have trouble faulting people when I think back to the emotion at that time. How desperate people felt, the fear that they were having from this disease and the possibility of the hope that this vaccine offered. I can’t give an answer if it was the right or wrong thing.

I personally wouldn’t have voted for it, at least for people under the age of 65. I would have wanted much more data on people under 65. For people over 65, I would have been hard-pressed to have voted against it. But that choice also wasn’t given in the FDA, to only give it to one group. So I think it’s a difficult question. I don’t see why we approved it in people under the age of 65, when we had the time to do further studies. And it wasn’t as much of an emergency in that group. I think that maybe we confused the public with the kind of public health messaging that maybe overestimated the risk for people in that age group.
**Commissioner Massie**
In the current situation with Omicron and where we are at with all the people that have been previously infected, would you recommend that the general vaccinations should be suspended?

**Dr. Joseph Fraiman**
I believe that we need to explain to the public where we are on our certainty level on this vaccine. Does it mean that some people could still make the decision with that uncertainty and choose to take the vaccine? That’s also difficult to say, but I don’t think that we should be recommending it widespread to everyone ages six months and up, or continuing to boost indefinitely without knowing if the harms and benefits, which one is higher. And continuing that with no end in sight doesn’t seem like a reasonable plan.

Commissioner Massie
Thank you.

Dr. Joseph Fraiman
And do you have any more questions? I can’t hear.

Chad Horton
That will be everything Dr. Fraiman, thank you.

Dr. Joseph Fraiman
Thank you very much.

[01:09:15]

[00:00:00]

Ches Crosbie
Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Paula Doiron
I do.

Alison Steeves
Can you please state your full name, where you live, and your occupation?

Paula Doiron
Paula Doiron. I'm 48 years old. I'm from Moncton, New Brunswick, and I work in a nursing home.

Alison Steeves
And what's your role in the nursing home?

Paula Doiron
I was a cook, but I demoted my position to custodian when I got ill.

Alison Steeves
Okay, so you were a cook and then became a custodian in the same business.

Paula Doiron
Yes.
Alison Streeves
And how long have you been working there?

Paula Doiron
Seven years in all. One year with the new position.

Alison Streeves
And are you currently going to work?

Paula Doiron
Not presently, no, I’m on sick leave.

Alison Streeves
And when did you go on sick leave?

Paula Doiron
October of 2021.

Alison Streeves
You were there in 2020 and 2021 up to that point throughout the height of the pandemic?

Paula Doiron
Yes, I was there during the beginning of the pandemic, yes.

Alison Streeves
And can you describe what it was like to work there prior to the pandemic, like before early 2020?

Paula Doiron
I really love my job. It’s a good work environment, but we were very short staffed, so we had a lot of complications before the pandemic with keeping staff. So this means that the residents don’t always get the proper care and attention that they need or want. Before the pandemic, we have a pretty big facility. There’s three different wings. They have access to a great big common room that they could go have activities in, have bingo nights; their families would come visit, and they were able to be everywhere in the nursing home.

Alison Streeves
So there was a lot of social interaction among the residents?

Paula Doiron
Yeah. Once a week there would be entertainment that would come in, bands that would perform for them, music.
Alison Steeves
And in your role, did you interact much with the residents?
Paula Doiron
I did, yes.

Alison Steeves
So you observe their day-to-day. And how were the relationships among staff members and sort of that atmosphere?

Paula Doiron
It was good. A lot of people are tired because you're short-staffed, but we always kept busy and jovial. It was a good work environment.

Alison Steeves
And can you talk about how things changed around 2020, when the government started implementing COVID-19 measures? How that changed in the nursing home for staff, for residents, and sort of what specific measures you saw being implemented.

Paula Doiron
In the beginning, it was very chaotic and disorganized. For a long time, we didn't have PPE, so we were very anxious, but everybody was healthy. We sanitized our hands and after a while they started introducing the vaccines.

Alison Steeves
I just want to take you back to even before that—like sort of, say, March 2020, around that time, with nursing homes being sort of one of the hardest-hit. I believe around that time, they had locked down and prevented visitors from entering.

Did you see some of those types of impacts taking place early on?

Paula Doiron
Right away, we locked down. Families weren't allowed to visit anymore. The residents all were set into their assigned wings, so they didn't have access to the big common rooms. The entertainment was done. So they got segregated more into their specific wings. The families couldn't visit anymore. Families would come visit through the windows. That was sad.

Alison Steeves
Did you see the impact on the residents from these measures?

Paula Doiron
Yeah, it was hard for them because that's what they live for, to see their family, and the activities. So yeah.
**Alison Steeves**
So before they would have had fairly active days, be out and about.

**Paula Doiron**
Yes.

**Alison Steeves**
And were there always activities to be scheduled every day?

**Paula Doiron**
Yeah, yeah—in each wing, there’s activities every day, but the common room was like the bingo night, and bingo was their favourite activities.

**Alison Steeves**
And where would they eat? Would they usually eat together?

[g0:05:00]

**Paula Doiron**
They ate in their wings. Every wing has an eating area for each wing, so that’s more like satellite common rooms.

**Alison Steeves**
And during the lockdowns, how did that change?

**Paula Doiron**
During the lockdowns, they could still. But after the vaccines and stuff like that, staff members were diagnosed with COVID, so they actually put the residents into their tiny little rooms, so they wouldn’t be contaminated.

**Alison Steeves**
So the protocol was, if somebody tested positive for COVID, there was kind of further segregation.

**Paula Doiron**
Yeah, further segregation in their specific little rooms.

**Alison Steeves**
And were they permitted to leave their rooms?

**Paula Doiron**
No, they were not. They couldn’t go in the dining rooms anymore and their assigned wings, or they couldn’t visit each other anymore. They were in their little rooms.
Alison Steeves
Did that affect their roommate situations?

Paula Doiron
Most of them have their own personal rooms, but there are a couple of residents that share rooms that have two living areas in it.

Alison Steeves
So they went to be in their rooms on their own, but no visitors.

Paula Doiron
Correct.

Alison Steeves
For how long? If someone tests positive, how long would that sort of lockdown last for?

Paula Doiron
I believe the first one was for until Public Health said that it was okay to keep them out of their rooms, but at one point they were put into their rooms for almost two months.

Alison Steeves
So around January 2021 when they rolled out the vaccines: elderly and people working nursing homes were first in line, or close to first of line, correct? To be eligible to take the vaccines?

Paula Doiron
Yes, we were.

Alison Steeves
Did you notice the introduction of the vaccine and discussion of the vaccine have further impact in the nursing home?

Paula Doiron
A lot of us were very happy that we were first, because we wanted to get back to normal. We wanted to see the residents get normalcy again, so most of us were very eager—but not everybody.

Alison Steeves
And was everyone very eager to take the vaccine, or were people outspoken about their choosing not to take it, and did that sort of have any impact on—
Paula Doiron
No, they only became outspoken when it became mandated.

Alison Steeves
And can you elaborate. How did that change things?

Paula Doiron
We lost some staff members. They decided against the shots. We were already short-staffed. This means that we’re shorter staffed. Less assistance for the residents.

Alison Steeves
And were there any issues prior to the mandate of staff or residents being concerned about who was vaccinated, who was not vaccinated?

Paula Doiron
Well, everybody kept their distance. I remember one of our coworkers: she hadn’t been vaccinated yet. It was starting to be mandated and she was sad. She was on the fence on what to do. And just people kept their distance from her. One day, I just went up to her and I gave her a hug and I said, “I accept you for whatever you decide.” But it was sad to watch them being outcasted.

Alison Steeves
And how was morale at this time? How were people feeling?

Paula Doiron
Anxieties. Anxieties. Always busy because, when you’re short staffed, you’re doing the job of more than one person. You’re doing a two-people job. So you don’t really have time. You’re just kind of on autopilot.

Alison Steeves
And did you decide to take the COVID-19 vaccine?

Paula Doiron
I did, yes.

Alison Steeves
And you took another shot that year as well?

Paula Doiron
Yes, yeah. I took the flu shot, 2020, before the rollouts of the COVID. I figured I was adding that to protecting the residents.
Alison Steeves
And then how many COVID-19 shots did you take?

Paula Doiron
After the flu shot, I had three Moderna.

Alison Steeves
Moderna. And when did you take those?

Paula Doiron
The Moderna were in 2021. So the first one was in January, the second one February, and then I had my booster in November.

Alison Steeves
And where did you take the COVID-19 vaccines?

Paula Doiron
The three first shots that I received, including that flu shot, was at my place of work because we have nurses there. It's a hospital, so it was done there.

[00:10:00]
And my booster was done at a drugstore.

Alison Steeves
And who administered the shots?

Paula Doiron
Nurses, where I work. And at the drugstore, it was an attendant.

Alison Steeves
And did any of these people speak to you about the potential risks of taking that flu shot and the vaccines?

Paula Doiron
No, they did not. I had no idea that it was a gene therapy. I thought it was a vaccine. Also, I figured if I got sick, that I would get assistance, get medical help. And I had another thing, but I forget.

Alison Steeves
Why did you think that if anything went wrong, you would have support?
Alison Steeves
With any of these vaccines, did you experience symptoms afterwards?

Paula Doiron
I did, yeah. I experienced with the flu shot, 2020. The night when I got home, I was fine. When I went to bed, my legs started pulsing. I fell asleep. When I woke up, I woke up with a horrible headache. My neck was so sore I wasn’t able to lay on it. And it felt like a flashing light had gone in my head. And I was also having issues breathing.

Alison Steeves
And that was the evening that you took the shot.

Paula Doiron
That was the evening of yes, yeah.

Alison Steeves
And did you speak to health—

Paula Doiron
I fell asleep. The next day I felt a bit better. I didn’t think— It took a couple of days. For three nights, my neck was really sore. I wasn’t able to lay on it.

Alison Steeves
And did you see anyone about those symptoms or get a diagnosis?

Paula Doiron
No, I didn’t. I just—

Alison Steeves
And did you experienced similar symptoms in the past?

Paula Doiron
No, no ma’am.

Alison Steeves
And then did you mention a booster. You also experienced symptoms?
Paula Doiron
The booster: I had a reaction with the booster as well. That one was worse. When I had my booster, three weeks after, I had to go to the ER. My head and my spine felt like it was on fire, and I was having issues breathing. So 8-1-1 suggested I go.

Alison Steeves
Did you say head or neck, sorry?

Paula Doiron
My neck, my head, and my spine felt like it was on fire. My neck felt like it was melting.

Alison Steeves
And what happened at the Emergency Room?

Paula Doiron
After the booster, it dawned on me that, because I’d been feeling ill for a while — It dawned on me that this was possibly because of the vaccines that I’d been receiving.

At that point I’m like, “I’m going to go to the ER and I’m going to ask them if it’s normal to have a headache and a sore neck at the same time.” I looked it up and they say, “You’ll have the sore arm and you could have a headache.” But the sore neck and sore head were indications that it could have been Guillain-Barré syndrome, meningitis, Parsonage Turner Syndrome, SIRVA [shoulder injury related to vaccine administration]. So I did a bit of research before I went. When I got there, the triage nurse— I asked her if it was normal to have the headache and the sore neck, and she didn’t answer me, and she gave me a really dirty look. When I got with the ER doctor, I asked him, and his words to me were, “What do you have against vaccines?” And then I told him, “Well, I’ve had four in the span of 14 months. There’s something wrong with me.” But they wouldn’t answer my questions.

The next day, I figured I’m going to go ask the pharmacist. I was picking up my prescription. I thought maybe the doctor and the triage nurse were having a bad shift, so I’m like, “I’m going to go speak with the pharmacist.” And I asked the pharmacist, “Is it normal to have the sore neck and the headache, or the headache.” And then he asked me what side I had received my injection, and I told him it was the different side of where I was hurting. And then his words to me were, “I’m not buying it.” Like I’m trying to like sell him Tupperware or something! And then I asked him about the 2020 flu shot recall.

[00:15:00]

Because I had found information that this flu shot had had a recall. And he looked at me; he’s like, “I’m too busy. I’m not talking about this with you right now.”

Alison Steeves
Did they run any tests at the ER?
Paula Doiron
When I went to the ER, I had to beg for testing. At that point, I'd already done a bit of research myself, and I was concerned. And I asked him if I could get an MRI. And he told me that I didn't need that. He did authorize an X-ray, so I received the X-ray that evening. And then after the X-ray from my results, he came and he told me that the MRI would be approved, because he had found some issues in my neck.

Alison Steeves
Okay. And did you provide me with a copy of the MRI results?

Paula Doiron
Yes.

Alison Steeves
Okay. Do you have that in front of you?

Paula Doiron
I sure do.

Alison Steeves
So that is Exhibit TR-0006b. And it reads, “The impression as moderately advanced C5-6 degenerative disc disease. There is severe disc slash Luschka joint osteophyte narrowing of the right C6 neural foramen. There is mild central canal narrowing at this level.” Is that correct?

Paula Doiron
That's correct.

Alison Steeves
And the recommendation was surgery consultation, correct?

Paula Doiron
Correct.

Alison Steeves
And did you have the surgery consultation?

Paula Doiron
I did speak with my family doctor after he received these results, over the phone. And my family doctor told me that a surgery wouldn't be approved for me. I asked to be transferred or referred to a neurologist. He said that there's a big waiting list. It would be about three years. And I said, “well you, you can put me on the list, I could get worse by then.” And he's
like, “yeah, I'll put you on the list, but they're not going to approve this type of surgery for you.”

**Alison Steeves**
And what was his suggestion?

**Paula Doiron**
I would have to live with it.

**Alison Steeves**
So in 2020, you took the flu shot. You experienced severe symptoms that persisted, and then you got your two Moderna vaccines. And then when you had your booster, you had more severe symptoms. Were they sort of different symptoms? Did you say they exacerbated the original, or it was completely different?

**Paula Doiron**
After the booster, it was different. That's when I started getting, like, body jolts. I started having menstrual issues. I also had brain zaps, brain fog, fatigue. I had to take three naps a day, and nerve pain, a lot of nerve pain. And the sensation of my legs, the pulsing, has never gone away.

**Alison Steeves**
And had you had any issues in the past or any pre-existing conditions that would explain any of those symptoms?

**Paula Doiron**
No, the only issues I had in the past: I had asthma, I have a bladder condition called interstitial cystitis, and I was on antidepressant.

**Alison Steeves**
And what made you think there could be a connection with the vaccines?

**Paula Doiron**
Well, I'm having all these issues with my neck a year after. And when I received that flu shot and other shots, I was always having a sore neck. I kind of put two and two together that—

**Alison Steeves**
And how did you feel about the response you received from the various healthcare providers when you inquired about that connection?
Paula Doiron  
It's very frustrating. I think I deserve to be treated better than that. I did my part, and I actually mentioned this to the ER doctor. I said, "You know, I did this to protect others and residents, but now I'm injured and somebody needs to protect me."

Alison Steeves  
And do you know if any of the healthcare professionals you spoke with filed an adverse event following immunization form?

Paula Doiron  
No, they did not.

Alison Steeves  
And Paula, you also had a gene analysis done. Is that correct?

Paula Doiron  
Correct, yes.

Alison Steeves  
So that's Exhibit TR-0006a. And do you have that in front of you?

Paula Doiron  
I sure do.

Alison Steeves  
Can you explain? So who provided you with this gene analysis?

Paula Doiron  
This was done with a naturopathic doctor.

Alison Steeves  
And how did they do it?

Paula Doiron  
It's with your saliva sample, so they're able to see your gene makeup. And I was explained that I have a mutation, a gene, that's actually very sensitive when it comes to vaccines.

Alison Steeves  
And that's the MTHFR [gene], is it?

[00:20:00]
Paula Doiron
I had the worst one she told me.

Alison Steeves
So these notes, the handwritten notes on the results: is that your handwriting?

Paula Doiron
That's my handwriting, yes.

Alison Steeves
And when did you write that?

Paula Doiron
As she was explaining to me, because I need to take some vitamin B, I guess. So I just dabbled.

Alison Steeves
So that supports that you might be at risk of having bad reactions, to suggest the possibility?

Paula Doiron
Yes.

Alison Steeves
And had you had any bad reactions with vaccines in the past?

Paula Doiron
Well, I didn't think so but now that I'm looking into past, I had received a vaccine as well in 2005 while I was pregnant. It was a DTaP. And not long after this DTaP, I had massive muscle and joint pain to the point that I was on the couch for a month. I went to the hospital then and the doctor at the time told me that it was from— I was newly pregnant, and I was expanding, so I would get muscle sores and aches. But I was so sore that I was on the couch for about a month. And I think it was five months after, my water broke early, and my son was only alive for one day.

Speaking with the doctors then, they said, “We can't explain why these things happen. We don't know why.” And now that I see these types of— This type of documentation, it kind of makes you wonder if that's the case? I'm not saying it is, but unfortunately, I can't go speak with a doctor and say, “Hey, is this what happened to my son?” Because I don't think they would be honest with me.

Alison Steeves
In terms of the impacts that these symptoms have had on your life, you're currently on sick leave due to these symptoms?
Alison Steeves
And how else have these symptoms and your diagnosis impacted your day-to-day life?

Paula Doiron
It started October, 2021. I tried to return to work a few times, but I was getting more sick.

Alison Steeves
And was that before your booster?

Paula Doiron
This was before the booster. Yeah, I actually got my booster as I was on sick leave because I didn’t know that I was having issues with the previous vaccines at that point. It only clicked in when I got my booster.

Alison Steeves
And what has the financial impact been of being off on leave? Are you getting benefits or disability, or—?

Paula Doiron
No, I’m not. Right now, I’m kind of living on my credit card. My brother is helping me as well. I got help in the beginning: I think it was 15 weeks for EI for a sick leave. But once that ran out, I tried to go back to work and I couldn’t. So I’ve just been footing the bill.

Alison Steeves
You tried to go back to work when your benefits ran out?

Paula Doiron
I did, yeah.

Alison Steeves
And what happened?

Paula Doiron
I couldn’t move for a long time. For months, I was on the couch. I couldn’t even walk. I would walk kind of hunched over. I’m just starting to be able to walk straight now after a couple of years.

Alison Steeves
And how else have these symptoms and your diagnosis impacted your day-to-day life?
Paula Doiron
I used to be very active. I used to be very happy and social. I’m not so much anymore. I’m isolating more now.

Alison Steeves
And why is that?

Paula Doiron
I’ve lost connections with some of my family, my friends. I’ve tried to reach out to explain to them what’s been happening to me, and they have blinders on. They don’t want to speak to me about it. They’ve kind of disconnected from me.

Alison Steeves
And has this experience impacted your mental health at all?

Paula Doiron
Yes—yeah, it has. It’s made me very anxious. I mean, I’m doing research now, and I’m seeing these doctors come up with heart attacks, cancer, and I’m still trying to figure out what issues— I have some diagnosis, but I know there’s still something wrong with me. I still—

Actually, in a couple of weeks from now, I have someone that’s going to go through my blood work. And there’s discrepancies in my blood work as we speak and my urine sample. So yeah, I’m anxious. I don’t know what’s wrong with me. And it’s been two years of being sick and I’m having to run around, “Please, someone help me.”

Alison Steeves
And how are your symptoms today?

Paula Doiron
I’m still sore. I’m still sore. It’s chronic.

Alison Steeves
Has anything helped?

Paula Doiron
When I was at my worst, I did ivermectin. It cleared my spine and my head from burning within two days of using it. I’ve used it a bit more since, but it doesn’t— I think it was a one-shot deal.

[00:25:00]

But I’ve been on supplements, and DMG [dimethylglycine] is one that’s been a big game-changer for me. I’m trying to go all natural, and I’m slowly healing. I’m not worse.
Alison Steeves
And do you have any idea if or when you might return to work?

Paula Doiron
I’d like to return in May, but the last couple of days I’ve been in a flare-up, so we’re going to see how that goes.

Alison Steeves
What would you say has been the hardest aspect of this experience for you?

Paula Doiron
Getting treatment, getting taken seriously, my relationship with my family members and friends. And I had to leave a three-year relationship because he didn’t believe me that I was going through these issues, and I started going public to warn others. And his words to me were, “I can’t go out with a conspiracy theorist.” So I chose my health over the relationship. So yeah, I’ve lost a lot, but I’ve gained a lot too.

Alison Steeves
What do you mean by you’ve gained a lot?

Paula Doiron
I’ve gained a lot of knowledge. I’ve gained that I need to take my instincts. I need to follow those because in the beginning, I think I was on the right path, but I let people convince me to do something. Yeah, so follow my own instincts. And just—I met a lot of great people too, and there’s a lot of good people out there. And there’s a lot of people like me that’s injured as well.

Purple is kind of— If you see a Facebook profile picture and there’s purple in there, reach out to them, because they’re probably injured like me and we’re all in the same boat.

Alison Steeves
Thank you, Paula. I have no further questions. I’ll just turn it over to the Commission.

Commissioner Drysdale
Thank you. You did an excellent job of describing for us what you’ve been through. But I want to go back just a little bit, because there’s some people that really haven’t talked about it. And that was the patients, the people in the elderly residents. I don’t know a lot about that. That’s what my question is going to be, you might not know some of these answers.

Are the residents highly regulated by the government? How they take care of the residents? What are their ratios of staff?

Paula Doiron
Where I work, yes. It’s supposed to be regulated, but we can’t keep staff. Nobody wants to work for very long. I work there and I’m one person, but I have to do like a two-person job,
because there's not enough people that want to work. And you're working with sick people too. Like, their needs need to be met. Personally too, they deserve a bit of attention. And you can't even give them that attention of a conversation for two minutes because it's so busy that you kind of have to brush them off.

**Commissioner Drysdale**
Were there never inspections of the facility to ensure that the residents were getting the care that they were supposed to be getting?

**Paula Doiron**
Yeah, no. We do get some inspections, but not about the care. No, I don't remember any.

**Commissioner Drysdale**
When you were talking about them going into lockdown— I think you said that there were times when the residents were locked up for months at a time, I think there was several months—

**Paula Doiron**
It was almost two months.

**Commissioner Drysdale**
Did the workload on the staff as a result of that go up or down?

**Paula Doiron**
It was probably the same because, for the nurses, they have to suit all up with that gear, so it was more strenuous actually. And for the nurses as well—

Their food was being served in their rooms as well. I worked in the food department, so we make their trays. And then, usually they have a common room that they can go eat, where now it was like the nurses were having to go bring the food to them, and not so much us. So it probably caused more work.

**Commissioner Drysdale**
Well, you know, with people being locked up for a long period of time, especially elderly people, did you notice an effect on their mental health and happiness?

**Paula Doiron**
Yes, it was heartbreaking.

**Commissioner Drysdale**
Did the regulator come in and assess that at all?
Paula Doiron
No.

Commissioner Drysdale
Did anybody ask questions about that?

Paula Doiron
I wanted to ask questions, but when you ask questions, “We’re just following public health.”

[00:30:00] [The livestream was inadvertently cut off at this point.]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Ches Crosbie
Chief Greg Burke, do you affirm that this eagle feather symbolizes your direct connection to the Creator for your people, and you hold it in the spirit of honor and truth to your ancestors who have passed, and to your ancestral spirits who are here today to guide you and protect you, that the evidence you shall give in this matter shall be the truth, the whole truth, and nothing but the truth.

Chief Greg Burke
Je vais, I do. Wela’lin.

Criss Hochhold
Thank you, Chief Burke. For those of us that don’t know you, can you please state your name and let us know where you’re from?

Chief Greg Burke
Chief Greg Burke, originally from Cape Breton, Glace Bay. Don’t hold that against me, though. I run a financial practice in Halifax. I live outside of Halifax now and my office is in Bedford. My name is Chief Greg Burke.

Criss Hochhold
Thank you. Can you tell us a little bit about your background, Chief Burke?

Chief Greg Burke
Well, you don’t want to know it all, but I just want to share with you that I do have four years of nursing at Toronto East General, and I’m just not another head in the crowd. So going through this was very difficult for me knowing that the knowledge that I had through my training—that I worked in the OR, cardiac arrest unit. We did training in pathology as
Chief Greg Burke

Yeah, I diagnosed myself with cancer back in 2019. Our medical system being what it is, what I told my doctor—I guess maybe I shouldn't have directed the doctor—but I told him I wanted to go to a private clinic and get an ultrasound done and get my bloodwork done. It all came back negative, so I went on my way, thinking I was getting old, I guess, and figured it was just an old age thing.

In January 2021, I went to him and said, "I definitely have cancer." I said, "I have to get a colonoscopy done," so I had a colonoscopy done. I ended up with surgery in April of 2021, followed by eight treatments of chemo, which ended on December 24th of 2021. Following that, when they did the CT scan, they found three blood clots in my lungs due to the chemo treatment, so they had me on a high dose of blood thinners from January through to June.

Criss Hochhold

Were you on any medication for your cancer?

Chief Greg Burke

Yeah, I had the eight treatments of chemo, as well as they gave me dilaudid, which I didn’t use. I didn’t need dilaudid, and through my surgery I didn’t need dilaudid. Although, they told me to take it. They said opioids get a bad rap, but for some reason I didn’t have pain. But I took the dilaudid home with me. And, of course, they give you all kinds of mouthwash to kill the lumps and bumps that get in your mouth, and the lumps and bumps that get all over your body. So you know—yeah, I was on medication as well as the blood thinners.

Criss Hochhold

You said you had lumps and bumps all over your body. Can you tell us more about that? That’s related to the medication?

Chief Greg Burke

Yeah, it was hard to describe. It got to the point where it got so bad that I couldn’t touch myself, actually. Because there were, like, little hives, millions of little hives all over your body.

[00:05:00]

And the chemo treatment causes tissue damage. So even as I sit here today, my feet are on fire from the tissue damage as well as tissue damage on your hands. Someday maybe they’ll get back to normal. But as I was explaining to you, Criss, even today I struggle trying to take the top off plastic Tupperware.
**Criss Hochhold**
Did the medications affect your cognitive abilities at all?

**Chief Greg Burke**
Well, combined with the operation and the chemo treatment, you end up with chemo fog brain they call it.

**Criss Hochhold**
What does that mean? Can you explain that a little bit further? What do you mean by that? What happens?

**Chief Greg Burke**
Well, a cop asked me that, and he said, “What do you mean by chemo fog brain?” The best way I can describe it is, it’s not like you’re drunk, but it’s almost like you’re in a daze, like you’re stupid. So your reaction time and your thinking time isn’t sharp. You do everything slow. You move slow. You talk slow. You react slow.

**Criss Hochhold**
So it takes you a little bit longer to process information, when you were having a conversation sometimes, depending on it at that time?

**Chief Greg Burke**
Yeah, you have to compress it and then react.

**Criss Hochhold**
Because of the chemo treatments that you went through, and the diagnosis of the blood clots in your lungs, were you given a medical exemption, for example, for wearing a mask?

**Chief Greg Burke**
Well, when I started the chemo treatment in June of 2021, they gave me a yellow card. I’ll just show that to everybody if they’re not familiar with it. This is a “go to the emerge.” card. There are all kinds of warnings on it—if you’re having a heart attack or high blood pressure or fever, whatever, I override everything in the emerge. other than a car accident.

And because of this, you’re very susceptible to bacteria or whatever. Everything I know about wearing the chin diaper, working in the O.R., what people were wearing was really a joke to me. And when I seen people wearing it, I felt sorry for them, knowing how dangerous it was for their health.

**Criss Hochhold**
I’m just going to quickly forward the commissioners that exhibit Chief Burke is referring to. There are a number of them, and the labels will be TR-0010, as well as TR-0010a through e. Those will be the exhibits that we’re referring to.
Chief Burke, I’m going to fast forward a little bit. I want to take you to an incident on February 9th, 2022, at approximately 3 p.m. Can you tell me about that, please?

Chief Greg Burke
Sure. Well, because I wasn’t wearing a mask—I didn’t wear a mask at any time in hospitals. I was there every 14 days to get my blood checked to make sure my hematology was good and white cells were fine.

Actually, I’ll share something with you: it’s when I first arrived there to get my blood checked to take my first treatment of chemo. There was a lady there, said while I was going to the washroom—I didn’t hear her say, but my wife heard her say: “You make him wear a mask.” And the oncologist came up to my wife with the mask not sterilized. You know, if you’re going to touch these things, you have to be sterilized, you’ve got to scrub up. Anyway, the oncologist said to my wife, “Could you get your husband to wear a mask?” And Susan said, “Good luck with that.” When they asked me, I said, “No, I’m not going to wear it.” I said, “It’s on your finger. You’re not sterile, so I’m not going to touch it.”

And I went into several stores. And of course, when I explained to them my condition, they were okay with it.

Criss Hochhold
And you went into Canadian Tire. Now, I really just would like for you to talk to us about what happened up until the interaction with the owner, because I would like to show a video for that particularly.

Chief Greg Burke
Yeah, I went into Canadian Tire, as Criss said, on February the 9th.

[00:10:00]

It was around quarter to three. And I was going to return an item, and I walked up to the return desk. There was a huge plexiglass on the return desk, a girl behind it wearing a face mask. And I put my item down and she said, “You’ve got to wear a mask.” I said, “I don’t wear a mask.” She said, “Do you have an exemption?” I said, “Yeah, I do have an exemption.” She said, “Well, I can’t wait on you.” I said, “Why not?” And she said, “Well, you’re a danger to my health.” I said, “You’re behind a plexiglass wearing a mask. How am I a danger to your health?” And she said, “Well, you’re a danger. I’m not going to wait on you.” And she walked away from me, and I said, “Well, can I speak to the manager?”

And bear in mind here, I’ve got chemo brain. So it’s almost like you’re in sort of a dream here. So she picked up the phone, and I stood there probably for five minutes, six minutes waiting for the manager to show up. Everybody was calling. The girls at the cash register were trying to get a hold of a Mr. Keating. And while I was leaning against the railing, this individual—did you want me to go further with this?

Criss Hochhold
Nope, I want you to go right up to the point that you’re going through now.
Chief Greg Burke
This individual showed up, and he kind of towered over me, and he started—

Criss Hochhold
One second, Greg, I’m going to stop you right there. Unfortunately, I don’t have HDMI capability on my side, so I need to walk over to Chief Burke to show you the video on the laptop.

Chief Greg Burke
Did you want me to keep explaining?

Criss Hochhold
I’m going to play the video. And when I play the video for you, you can watch it. You can narrate it.

Chief Greg Burke
So Criss asked me to narrate this for you while it’s on the screen. So you can see me, I’m up at the desk.

Criss Hochhold
I’m putting the arrow to Chief Burke, as you can see there. He’s the gentleman in the blue.

Chief Greg Burke
I noticed that gentleman in the blue kept looking at me because I didn’t have a mask.

Criss Hochhold
I’m just going to skip forward just a little bit until the interaction occurs. Because now you’re waiting for a few minutes.

Chief Greg Burke
Okay, so she’s waiting on me there, or telling me that she can’t wait on me. I asked to speak to the manager. So she disappeared there, and she went on the phone to call the manager. And I stepped back, and you see me leaning there while I’m waiting. And I waited, and I waited, and I waited. And there, this guy shows up. He never asked me who I was, or what I was doing there, nothing. He just immediately started saying, “If you’re not going to wear a mask,” and he’s screaming, “leave the store!” And you can see his hand gesture.

You can see me asking him to calm down because he’s white-faced, dry-mouthed, and very confrontational. I’m saying, “I just want to explain something to you.” He said, “No, I’m not going to listen to you. If you’re not going to wear a mask, get out.” And you see him shaking his head back and forth, saying no. And that’s when he gave me three options. First option was, I can do my business out on the street. Second was, I can do it online—this is returning an item now. And the third, I can wear a mask. And I immediately said to him, “No, that’s not an option. But let me think of my other option.” And I put my head down to figure out,
“How am I going to do this outside? They've got to bring the machine out.” This was how my brain was working that day.

And then when I left, I didn’t notice he went to the other side. And when I raised my head to ask him how I was going to do it outside, he immediately said—Okay, you see him grabbing me there. Immediately said, “If you’re not going to wear a mask, I’m going to throw you out.” And I said, “What do you mean? Like, you’re physically going to throw me out?” I couldn’t believe he said that. He said, “That’s right.” I laughed at him, and I started to leave. And I said, “That wouldn't be a good idea.” But I wasn’t referring to that I would knock him out, which maybe I should have.

[00:15:00]

What I was referring to was my health. I’m on high a high dose of blood thinners, I’m suffering from chemo brain fog. And I’m not myself, so that’s what I am referring to.

I think that triggered him. And that’s why he grabbed me. And I pushed him off me and I was warning him not to touch me. But he came at me again and I pushed him off again. And he backs me up to the return desk. I thought that I grabbed him to hold him off—obviously, the video, I didn’t do that. But I did warn him. I said, “Look, don’t you dare touch me.” I said, and this is the way I said it, because I’m not an excitable type of individual. There, he grabs me again. And I had to push him away again. And that’s where I told him, “Don’t touch me, I can hurt you. And believe me, I can hurt you.” So at that point, he’s hollering, giving directions to call the cops.

Right about now, I’m very nervous. I’m not afraid of him. But I’m nervous of him doing something that I’m not expecting, and he’d get the advantage over me. Because if you know anybody on blood thinners, you get cut, you’re going to bleed pretty bad. So that was my worry there. And I told him, “Well, I’m going to call the cops. You go ahead. I’m going to have you charged with assault.”

While I was leaving—Criss is not showing that—but as I was leaving, he kept following me. I said, “Don’t follow me.” Because I was worried that he was going to jump me from behind. And anyway, I went out into my car. And I waited in my car. I called 911 when I was in my car. And he came out. And I thought, okay, he’s come to his senses. He’s going to come and apologize.

Criss Hochhold
I’m sorry Greg. I thought I pressed play to finish the video and I walked away. My apologies for that.

Chief Greg Burke
Okay. So he’s giving orders to the girl to call the cops, and right about now—I don’t know, this guy is unpredictable. I mean, he’s crazy. His eyes were like that, coming at me.

Criss Hochhold
Chief Burke, I know that the video is still playing, and we can probably switch off that. Thank you again because you do exit the store at that point in time. The lady that walked off. She at this time is actually calling 911 and the audio recording for that is available to the commissioners. It is one of the exhibits. As well as, Chief Burke, after the confrontation,
and you went outside, I know the store owner followed you, but what happened outside of
the store? Did you call anybody?

Chief Greg Burke
Yeah, I called 911 and told them that I've been assaulted, and I want charges laid against
the— I thought he was the manager. I didn’t know he was the owner.

Criss Hochhold
For the commissioners, that 911 recording is also part of the exhibits that you can listen to.
After that, what had taken place? Fast forward to when the police officer arrives. What
happened then?

Chief Greg Burke
Yeah, I was talking to two RCMP officers that were in the parking lot at the time. They were
on their coffee break and we were chatting. I waited about 15-20 minutes and this Bedford
cop showed up. He asked me what was going on. I said, “Go watch the video and come back
and talk to me.” Which he did. He went in and he came back out. It was a beautiful day, and
he was wearing one of those N95 masks. And I thought, “Oh boy, this is going to be good for
me.” They called the right guy.

So anyway, he went in and he came out and he said, “Yeah, I watched the video.” He said,
“You’re not going to charge me. I defended myself.” He said, “Well, he’s allowed to do that.” Yeah. So the Bedford Canadian Tire store: bring a
bodyguard with you because they’re allowed to grab you.

Criss Hochhold
Chief Burke, excuse me, please. Keep it down please, thank you. Chief Burke, the interaction
with the police officer: Can you tell me specifically about that? What was the conversation
you had with him and what was the result of that?

Chief Greg Burke
Well, it wasn’t much. After he said that he wasn’t going to charge me, he said, “I’m going to
give you a ticket.” I said, “a ticket for what?”

[00:20:00]

He said, “for not wearing a mask.” I said, “a ticket for not—” I’m thinking, what ticket? And
he walked away, and didn’t ask me what transpired inside, nothing. And he went to his car,
and I waited and waited in my car.

And then I went over to his car in probably about 15, 20 minutes. I said, “What’s going on?”
He said, “Well,” he said, “I’m having difficulty. They change the rules all the time, so I got to
find out if I’m charging you with the right thing or not.” So he said, “I apologize for taking so
long, but here’s a ticket for not wearing a mask.” And I said, “Not wearing a—what the
heck?” And I look: it was $2,422, something like that.
Criss Hochhold
So the interaction with the police officer resulted in you receiving a fine for not wearing a mask. Did the officer at any point ask you if you had a mask exemption?

Chief Greg Burke
No.

Criss Hochhold
So there were no inquiries whatsoever about what transpired inside? He went inside the store and he felt satisfied with what he observed to issue you a fine but not proceed with anything else?

Chief Greg Burke
Yeah. But I found out later, when I tried to force him to put an assault charge on this guy. When I spoke to his sergeant, his sergeant said, "Well, I read his notes and I don’t see that we should file assault charges. It’s not going to go anywhere."

Chief Greg Burke
And I said, "You read my notes?" He said, "Well, yeah." I said, "He didn’t take any whatever from me. He didn’t take any statement." He said, "Well, we got it on—" I said, "Well, he didn’t even talk to me about it." So he said, "I’ll send over an officer now."

So any way, where was I?

Criss Hochhold
Chief Burke. I would like to stop this one here because we have another very important incident that we definitely have to get to.

Chief Greg Burke
I just will say this, that the cop lied to Canadian Tire and told him I was banned for six months. He never ever put a ban on me for six months. So this guy was a loose cannon.

Okay.

Criss Hochhold
So thank you. I now want to fast forward you 30 days to an incident on March 9th that you were also involved in. Can you briefly describe that for me?

Chief Greg Burke
Well, that was actually 30 days after the Canadian Tire assault. So Canadian Tire was February 9th and this is March 9th. And there was a homeless guy that I knew from years ago living in his car, so I thought I’d go and buy him supper. It was a late evening, so we went to A&W. I walked in, and the girl said, ”you got to wear a mask.” I said, ”I don’t wear a mask,” and she said, ”well, you do your order by the plexiglass.” So I ordered for both of us and all of a sudden, this guy comes out—you can tell he was a migrant—he comes out of
the door like a cannon had shot him through the door and started screaming for me to wear a mask. And I said, “well I got my order, it’s right there.” And he kept saying, “you got to wear a mask.” He was screaming, he was really upset. I said, “well, do I wear a mask if I sit down?” “No.” I said, “well I’ll sit down, and you can bring it.” No, he wouldn’t do it. I said, “how long you been in the country?” He said, “three months.” I said, “Did they teach you anything about the Canadian Bill of Rights?” “I don’t care about your Canadian Bill of Rights.” I said, “If you don’t care about my Canadian Bill of Rights, you go back to the country where you don’t have rights.” Anyway, he said, “Well, I’m calling the RCMP.” I said, “Go ahead.” I said, “Give me my money back.” He wouldn’t give me my money back, so I said, “When the RCMP come, I’m charging you with theft, because I want my money, I’m leaving. Now.” And this is the way I was talking.

Criss Hochhold
I’m sorry. I hate to interject, but in the interest of time, can you take us to the moment outside, when the police arrived, regarding this incident?

Chief Greg Burke
Yeah, I’m not a long-winded person but I’ll try to be short. As I was leaving, two RCMP officers were walking in, and they said, “What’s going on?” I said, “I came here to order food. They took my order, then he wouldn’t give me my money back, and I’m just about to leave.” He said, “Let’s go outside and we’ll talk about it.” I said, “okay.” We go outside, and he said, “Do you have your ID?” I said, “yeah.” “Show me your ID.” I said, “Did I break the law?” He said, “no.” I said, “Well, you don’t need my ID. I’m leaving.” He said, “no you’re not.” I said, “I’m detained?” “No.” I said, “Well, I’m leaving.” “Give me your ID.” “No.” So that went back and forth.

As this was going back and forth and I was trying to explain to the RCMP the rights and the laws

[00:25:00]

this little RCMP officer is coming across the parking lot. He immediately grabbed me and tried to throw me up against the wall. He said he was going to charge me with resistance. I said, “I’m not resisting.” I said, “You can handle my arms.” I said, “Just relax.” I said, “I’ll give you my arms if you want to handcuff me. You want to go down this rabbit hole, let’s go down this rabbit hole.” So I helped them handcuff me from behind and then he started pushing me towards his car. I warned him not to push me and he didn’t push me after that. And we get in the car.

Now, you have to appreciate, my skin is still hurting from the chemo treatment. He was helpful, he helped me get my legs in the backseat of the car. Because if anybody’s been in the backseat of the RCMP car, they’re like getting in a coffin. So anyway—

Criss Hochhold
Chief Burke, I want to just really touch upon when you had that interaction with the one police officer. You were having a conversation about the masking situation when an officer approached, came across in the parking lot and basically put his hands on you to affect the rest. They did tell you that you were under arrest at any time before they laid their hands on you, before they touched you?
Chief Greg Burke
Sorry. Repeat that again?

Criss Hochhold
When the second officer came and who then physically tried to take control of you, did he advise you that you were under arrest at that time?

Chief Greg Burke
No, no.

Criss Hochhold
How much force would you say—I know it’s difficult to gauge, but when he tried to gain control of you, was there a struggle? Is that why he was saying, you know, stop resisting? Were you struggling? Were you resisting the officer?

Chief Greg Burke
Yeah, he tried to slam me up against the brick wall. That’s what he tried to do, and I tried to prevent it because I didn’t want my face to go into the brick wall because I’m still on blood thinners.

Criss Hochhold
Right, so then you were cooperative, and you allowed him to put the handcuffs on?

Chief Greg Burke
Yeah, and I wasn’t combative or saucy or anything. I was just standing up for my rights.

Criss Hochhold
Were you handcuffed in the front or in the back?

Chief Greg Burke
Back.

Criss Hochhold
And then he pushed you towards the police car?

Chief Greg Burke
Yeah. Yeah, he pushed me several times.

Criss Hochhold
Okay. What did you say to him when he was pushing you?
Chief Greg Burke
I told him not to push me again.

Criss Hochhold
And then you walked to the police car, and he put you in the back of the police car. And he assisted you putting your legs in, because the backs of police cars are very, very small.

Chief Greg Burke
Confined, yes.

Criss Hochhold
Thank you, yes. What happened then?

Chief Greg Burke
He read me my rights and asked me if I understood them. And I said, “I understand the rights,” but I don’t understand why he read them. And I said, “what are you charging me with?” He said, “creating a disturbance.” I started laughing. I said, “The only fools that created a disturbance is the little guy that got shot out of a cannon there, and you.” I said, “I didn’t create this disturbance.”

And so we had a conversation about the handcuffs. I said, “Look, you got to take these off.” I said, “I’m not a threat to you.” I said, “I never was a threat to you.” I said, “I don’t know why you’re overreacting the way you are, but,” I said, “let’s go down this rabbit hole.”

So while we’re having this conversation, the Mountie that initially spoke to me came and they had a powwow in the front of the RCMP car. And then the guy that put the handcuffs on me, he said, “I’m going to give you a ban for six months.” And of course—I was teasing him—I said, “Oh my god, I’m going to starve to death. I’m not going to get out—” You know, I was basically being a smart ass, but I thought he deserved it.

When I get out of the car, I tried to ask him a legal question about showing your ID. Finally, after four or five attempts, he finally answered my question. And I asked him, I said, “if I’m walking down the street at 3 o’clock in the morning, do you have the right to pull me over? Although I’m not committing a crime, do you have the right to ask for my ID?” He said, “If I’m suspicious, I can.” Now that’s totally wrong.

So anyway, the two of them are under investigation.

Criss Hochhold
Chief Burke, I will eventually get to that, that’s okay. Once your interaction ended, you were given a piece of paper, which you understood to be basically a Protection of Property Act notice banning you from entering the A&W, that location?

Chief Greg Burke
No onion rings for six months.
And oh, by the way—none of those RCMP officers were wearing a mask.

Chieˆ Greg ure
Okay, as I understand it and what you've already said about it—

[00:30:00]

Criss Hochhold
But you were banned from the property for six months?

Chief Greg Burke
That’s correct, yeah.

Criss Hochhold
And did the officer open a piece of paper that he served you with and did he explain that to you?

Chief Greg Burke
No, he folded it over and gave it to me.

Criss Hochhold
Okay, so it was folded over, and he gave it to you, and he told you that you were banned verbally for six months. Was there anything within that piece of paper?

Chief Greg Burke
Yeah, I discovered after I opened the paper, there was a ticket for not wearing a mask: $2,422.

Criss Hochhold
Did the officer inform you at any time that you were being issued a citation for not wearing a mask?

Chief Greg Burke
Never. Neither one of them. And in fact, the ticket was written by the other Mountie, not by the Mountie that handcuffed me.

Criss Hochhold
Okay, as I understand it and what you've already said about it—

Chief Greg Burke
And oh, by the way—none of those RCMP officers were wearing a mask.
Criss Hochhold
The interaction you had with the officer outside of the store: They were not wearing a mask?

Chief Greg Burke
None of them were wearing a mask in the store or outside.

Criss Hochhold
When you say “in the store,” did an officer have occasion to go inside the store? Did an officer go inside the store to find out what happened?

Chief Greg Burke
I don’t know. The only time I seen the girl and the initial constable was when I was leaving. I don’t know if they went back in.

Criss Hochhold
But that’s the initial contact inside the store—both of those officers came inside the A&W not wearing masks when you were there.

Chief Greg Burke
Correct.

Criss Hochhold
But you were issued a citation for not wearing a mask in a store, although they were not either when they entered the store.

Chief Greg Burke
Neither one of them wore a mask.

Criss Hochhold
Thank you for that. Chief Burke, I’m going to keep it short, but you’ve already stated as part of your testimony that you’ve made a complaint against these RCMP officers. You’ve made a public complaint?

Chief Greg Burke
To Ottawa, yes.

Criss Hochhold
Can you give me a brief overview of that?
Chief Greg Burke
Yeah, I called the sergeant to my house. He was a real nice guy; we had a good conversation. He was shocked that I was given a ticket without my knowledge. He said, “we don’t do business that way.” He wanted me to lodge a complaint with Ottawa, which I did. It’s still under investigation. The constable that is taking care of it on the local area has found the initial RCMP officers in six violations. The one that handcuffed me is under 12 violations. And they’ve asked me what I wanted done. And I said that I want the two of them fired.

Criss Hochhold
Thank you. Thank you for that Chief Burke. And in the interest of time, the documents are included and I will just defer to the commissioners for any follow-up questions.

Chief Greg Burke
Yeah, just one other thing that we didn’t touch on, Criss. He told me that— While I was in the car and he told me he was going to ban me he did say that he wasn’t going to charge me. I said, “Yes, you are.” So we had a little argument back and forth that I wanted him to charge me.

Criss Hochhold
To put that in context, that would be your interaction with the RCMP also at the A&W, when you were placed in the back of the police car.

Chief Greg Burke
Correct.

Criss Hochhold
And what were you arguing for to be charged with?

Chief Greg Burke
Well, he was going to charge me with disturbance, and then he said he wasn’t going to charge me. And I said, “No, I want you to charge me because we’re down this rabbit hole. So I want you to charge me.” He said, “No, I’m not going to charge you.” And I said, “Why not?” He said, “I’m not going to charge you.” That’s where we were.

Criss Hochhold
Thank you.

Chief Greg Burke
Thank you.

Commissioner Drysdale
We’re running out of time, but I judge you as a pretty amiable man. You’re social, and you’re communicative, and I have a feeling that you’re well-known in public to your community.
Chief Greg Burke
Yeah. My wife doesn’t want to go out with me because—

Commissioner Drysdale
Join the club! The question I have for you is: Have you had people react to you this way before? Before this whole pandemic did people generally react in this way to you?

Chief Greg Burke
Never. Never. I’m not a confrontational person, although I’ve never, ever backed away from a fight.

[00:35:00]
I’ve been an enforcer on the ice all my life, you know. And being brought up in Glace Bay, you know somebody looks at you— You know, coal mining town, you’re fighting all the time.

Commissioner Drysdale
Then Canadian Tire happened and that was an incident. And A&W happened so it’s not an isolated incident.

What do you think motivated these people to treat you this way—apart from the fact you weren’t wearing a mask? Why would they react to you this way?

Chief Greg Burke
To sum it up, I would say the lack of knowledge, number one, the lack of education, and the influence that the medical health department and the politicians had on people by manipulating them.

Commissioner Drysdale
When you say the influence that the politicians and the media had on people, exactly what do you mean by that? What kind of influence?

Chief Greg Burke
Well, you had politicians that were passing laws that— You know, we got a young girl in here that she protested against Dr. Strange, or Strang, and she ended up in jail for six days. And the person that wrote that law, Brad Johns, who’s the Minister of Justice, happens to be one of the most crooked people. I don’t care about being so—

Commissioner Drysdale
Well, I think I’ve got my answer, but thank you very much.

Chief Greg Burke
Oh, you’re welcome.
Thank you very much, Chief Burke.

Yeah. Wela’lin. I want to thank everybody for coming here. I was impressed.

Just one second, Chief Burke. We do have one more question, I believe. Sorry about that.

I just wanted to ask if the two fines have gone to court, and what was the outcome? Or was it stopped when you did the investigation against the RCMP?

Sorry, I didn’t hear you.

I just wondered if there was any follow-up in court with the two fines. Or if the accusations—or the charge that you laid against the RCMP officers—if that has stopped the court action? I’m just wondering where it went from here, if there has been any follow-up?

My Canadian Tire ticket will be addressed on June the 1st at 6 o’clock. The RCMP ticket, I’m going to have to check on that. Criss and I had a conversation about that. He asked me if I went to court over that. And I said it was one of the stipulations—I asked the sergeant to drop it, given the fact that it wasn’t presented to me.

Thank you.

Thank you very much, Chief Burke.

Wela’lin.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

Ches Crosbie
Thank you everyone. We're going to resume the proceedings. The next witness is Sabrina McGrath. And Ms. McGrath, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Sabrina McGrath
I do.

Ches Crosbie
Thank you.

Nicolle Snow
Good afternoon, Ms. McGrath.

Sabrina McGrath
Hello.

Nicolle Snow
Ms. McGrath, I understand you're here today to testify with respect to the loss of your employment due to provincial COVID mandates.

Sabrina McGrath
Yes.

Nicolle Snow
Okay, where were you working?
Nicolle Snow
All right. And that's a provincial government job?

Sabrina McGrath
Yes.

Nicolle Snow
And what were you doing there?

Sabrina McGrath
I was manager for the last three years. And three years previous to that—or two years previous to that—I was assistant manager.

Nicolle Snow
Okay, and were you represented by a union?

Sabrina McGrath
Yes.

Nicolle Snow
Did your collective agreement provide for any sort of vaccination status as part of the terms of your employment?

Sabrina McGrath
No.

Nicolle Snow
And what position? Sorry, you indicated you were a manager. Were you a valued employee for the Liquor Commission?

Sabrina McGrath
I was. Just the year previous to being placed on unpaid leave, my store had won top-performing store, so it recognizes overall sale results in leadership.

Nicolle Snow
And that reflects on you as manager of the store?
Sabrina McGrath

Yes

Nicolle Snow

All right. And anything else with respect to your value to the store you were working for?

Sabrina McGrath

Yes, I received model performance on my latest PA, performance appraisal, which is a very rare—it's very rare to get that because I just don't give them out to just anybody. I did a pretty good job to get it.

Nicolle Snow

Nice. And so, what year did you have that, the model performance?

Sabrina McGrath

2021.

Nicolle Snow

Okay. What mandates and protocols did the Nova Scotia Liquor Commission adopt?

Sabrina McGrath

We did masking, Plexiglass, six feet distance, and then the latest was the vaccine mandate.

Nicolle Snow

And when was the vaccine mandate brought in?

Sabrina McGrath

We knew about it in October, but it was implemented January 15th.

Nicolle Snow

In October, they delivered the message to the employees, but it was going to be effective January 15, 2022?

Sabrina McGrath

Yes, for current employees. Anyone that was new to the corporation had to be done by November the 1st.

Nicolle Snow

It had to be done, meaning—
Nicolle Snow
All right. And were they required to show proof of that?

Sabrina McGrath
Yes, there's a declaration form that had to be filled out.

Nicolle Snow
And with respect to the deadline of January 15, 2022 for the existing employees, was proof required?

Sabrina McGrath
Yes.

Nicolle Snow
And what was going to happen if proof was not required? I'm sorry, I phrased that wrong: What was going to happen if proof was not provided?

Sabrina McGrath
People would be placed on an unpaid leave of absence.

Nicolle Snow
Okay. Was the adoption of this vaccination mandate contrary to some of the earlier views held by the employer?

Sabrina McGrath
Yes.

Nicolle Snow
In what way?

Sabrina McGrath
Well, in May of 2021, there was an occupational health and safety meeting. And at that meeting, vaccinations were brought up. And the response was vaccination is not required by law. It is an individual choice. Therefore, employees are not required to be vaccinated to be in the workplace.

Nicolle Snow
Okay. And were you reading from the minutes from that meeting?
**Sabrina McGrath**

Yes.

**Nicolle Snow**

All right. And, those minutes have been delivered for filing as an exhibit, but we don’t have an exhibit number yet [Exhibit TR-22d]. How did you feel about the vaccination mandate?

**Sabrina McGrath**

I was 100 per cent against a vaccination mandate. I think everyone should have the choice as to what they put in their body, and it shouldn’t be a choice as to keeping your bodily integrity or losing your job.

**Nicolle Snow**

And so how, if at all, did the environment in your workplace change after the vaccination mandate was announced?

**Sabrina McGrath**

We recently had a new regional manager, Kim Jackman, and she came into the store about the first of November. And we had a cut-out of Dana White—he’s a UFC [Ultimate Fighting Championship] person—promoting his new liqueur. When she came in and she seen it—a lot of stores had it, it wasn’t just our store—she demanded we take it down immediately because he was anti-vaxx.

**Nicolle Snow**

Okay. And was there anything on the poster that was related to vaccinations?

**Sabrina McGrath**

Just a picture of him. That’s all.

**Nicolle Snow**

And he was promoting his own product, his own product liqueur.

**Sabrina McGrath**

Yeah.

**Nicolle Snow**

Anything else?

**Sabrina McGrath**

Yeah, that same regional manager—it was 7 o’clock on a Friday—she came flying into the store. And she was being aggressive because she had reports that we had anti-vaxx propaganda up in the store.
[00:05:00]

Which we absolutely did not. But she went through the store with a fine-tooth comb. Didn’t find anything but she made us take a poster that we had up at the front of the store down. It was handmade by our team. It was just telling the pouring amounts, the proper pouring amounts, but it said “Cheers to Pour Choices” on it. So that’s what she had us take down, just in case that’s what people were complaining about.

Nicolle Snow
Okay, and so the “Cheers to Pour Choices” was with respect to the portion amount that you might be consuming of alcohol.

Sabrina McGrath
Right. Because we want to be socially responsible and making sure that people are ingesting the right pouring amounts.

Nicolle Snow
All right. Anything else?

Sabrina McGrath
Yeah, I was having a conversation with an employee from another store on LinkedIn, and he wrote a comment—because we have been discussing the mandates and things like that. He wrote a comment to me saying, “I thought you were leading your store to becoming fully vaccinated, not becoming fully unemployed.”

Nicolle Snow
Okay. And that was in the context of some conversation you were having with him about the mandates?

Sabrina McGrath
Right. Yeah. And then he deleted me.

Nicolle Snow
And then what?

Sabrina McGrath
He deleted me.

Nicolle Snow
Okay. Did you acquiesce to the mandate to vaccinate?

Sabrina McGrath
What’s that?
Nicolle Snow
Did you go ahead and vaccinate due to the mandate?

Sabrina McGrath
No. No, I did not.

Nicolle Snow
And what happened as a result?

Sabrina McGrath
I was placed on unpaid leave.

Nicolle Snow
And when did that happen?

Sabrina McGrath
January of 2022.

Nicolle Snow
Okay. Did you ever go back to the Nova Scotia Liquor Commission?

Sabrina McGrath
No, we had the option of going back in May on the contingency that we fill out a vaccination declaration form.

Nicolle Snow
All right. Tell us about that form.

Sabrina McGrath
It’s just a form to say whether or not we were vaccinated. They still wanted to know. We could go back into the workplace being unvaccinated, but they wanted to know whether or not we were. So we still had to attest to our status.

Nicolle Snow
Okay. So at that point the mandate to vaccinate had been lifted in the store?

Sabrina McGrath
Yes.

Nicolle Snow
Had it been lifted generally in the province?
Sabrina McGrath
It had been lifted in the province seven weeks before. The NSLC extended theirs for another seven weeks.

Nicolle Snow
Okay. During that period you were off—you said from January 2022 through to May—did you have any other source of income?

Sabrina McGrath
No.

Nicolle Snow
And did you apply for EI, employment insurance?

Sabrina McGrath
Yes, yes, I did.

Nicolle Snow
What happened with that?

Sabrina McGrath
I was denied.

Nicolle Snow
On what basis?

Sabrina McGrath
Service Canada deemed it as misconduct.

Nicolle Snow
And what were they calling misconduct?

Sabrina McGrath
Not following the vaccination mandate.

Nicolle Snow
Did you file an ROE with Service Canada for your application?

Sabrina McGrath
Yep.
Nicolle Snow
And did the ROE say anything about misconduct?

Sabrina McGrath
No, it just said unpaid leave.

Nicolle Snow
And so, were you able to determine how someone at Service Canada found that there was misconduct related to the vaccine policy when that was not on your ROE?

Sabrina McGrath
They said they called the NSLC. And when the NSLC told them it was mandate-related, they put down misconduct.

Nicolle Snow
Okay. Did you apply for a reconsideration of that decision?

Sabrina McGrath
I did.

Nicolle Snow
And what happened?

Sabrina McGrath
Denied.

Nicolle Snow
And you have a union?

Sabrina McGrath
Yep.

Nicolle Snow
Or you did have a union. Did you go to your union at all?

Sabrina McGrath
I did. I went before the, before it was even mandated. Once we found out it was going to be mandated, I went to them right away.
Nicolle Snow
That was October 2021 when you learned about it. Okay, so you went to your union and what happened?

Sabrina McGrath
They would do nothing. They said the employer was allowed to mandate vaccinations.

Nicolle Snow
And did they base that on any particular opinions?

Sabrina McGrath
They just said case law.

Nicolle Snow
Okay. And so, was there an indication that they went for legal advice or anything of that nature?

Sabrina McGrath
They said that they went to legal counsel and asked legal counsel and that’s what they said.

Nicolle Snow
And so, the determination was that they felt you would lose, so they may as well not fight it for you.

Sabrina McGrath
Yeah.

Nicolle Snow
Did you have an opportunity to see whatever legal advice was provided to the union?

Sabrina McGrath
No.

Nicolle Snow
Did you ask for it?

Sabrina McGrath
I did ask for it.

Nicolle Snow
And what happened?
Sabrina McGrath
They denied my request, saying that they don’t provide union members with that information.

Nicolle Snow
Okay. Did you bring any other grievances?

Sabrina McGrath
There was a grievance in April, but the union approached me about that grievance. It was the time period between when the government ended their mandates and the NSLC kept theirs for an additional seven weeks. The only period of time that the NSGEU [Nova Scotia Government and General Employees Union] was willing to grieve was that time period.

[00:10:00]

Nicolle Snow
And what happened with that grievance?

Sabrina McGrath
For me, I was—it was withdrawn because I was no longer working at the NSLC. So they withdrew mine, but other people got something.

Nicolle Snow
Okay. And so that was for the people who were placed on leave without pay: the grievance was with respect to that short period that they should have received their pay.

Sabrina McGrath
Right. Just that seven weeks, yeah.

Nicolle Snow
By that time, you had left your employment altogether. Okay. And so, you were on leave without pay for a period of time.

Did termination happen at some point?

Sabrina McGrath
They deemed me as being resigned from my position. If I didn’t fill out the declaration form by June the 12th, I was considered to have been resigned from my position.

Nicolle Snow
Okay. And why were you opposed to filling out the declaration form?
Sabrina McGrath
Because it’s still giving out my medical information. I would have done it before if that was the case, right? There was no point in doing it that late.

Nicolle Snow
Did you take any other positive action to try to combat the mandates and your concerns?

Sabrina McGrath
I did. I emailed the Premier, Tim Houston. No response from him—even now. And I wrote my HR and a few senior VPs. I emailed them all.

Nicolle Snow
And what happened with those emails.

Sabrina McGrath
As far as the senior VPs, no response from them. HR responded within a day saying that the appropriate people would see my email. And then I received a response on January 13th, which was two days before the mandate.

Nicolle Snow
And what was the general substance of your letter to Mr. Houston?

Sabrina McGrath
Just explaining why. Why mandates shouldn’t be implemented. Especially when it comes to losing your job. A lot of people got it just to keep their job and that’s forever in them now, right? I mean, people did it to keep their job. At the end of the day, you’re still dispensable, you know. Like, you can get that to keep your job and they can still let you go, so then you would have done it for nothing.

Nicolle Snow
And the substance of your letter, your emails to HR?

Sabrina McGrath
Pretty much the same. A lot of it was copy and paste.

Nicolle Snow
OK, all right.

Nicolle Snow
You brought with you today—so there’s the minutes we referenced. You brought with you also your 2021 annual performance check. You talked about your good performance appraisal. We have that with us, which will be entered as an exhibit [Exhibit TR-22a]. You brought with you today your e-mail to Tim Houston and your termination letter from the
Nova Scotia Liquor Commission. You brought with you today your response from Service
Canada declining your claim and the reasons why they declined it, as well as your response
from the union with respect to your grievance and your communications to HR. Is that
correct?

**Sabrina McGrath**
Yep.

**Nicolle Snow**
OK. And those I believe are scanned. We don't have exhibit numbers yet, but they will be
filed. All right, those are all my questions.

Thank you for testifying. And we'll wait a moment to see if there are any questions from the
commissioners.

**Sabrina McGrath**
Okay.

**Nicolle Snow**
All right, thank you very much, Ms. McGrath. Thank you. Thank you.

**Sabrina McGrath**
You're welcome. Okay.

[00:13:59]

[00:00:00]

Ches Crosbie  
You have the choice of swearing on the Bible. I believe there's one on the desk.

Pastor Jason McVicar  
I'll just let my “yes” be “yes.” So you just ask me and I’ll say, “yes.” I don’t need a Bible to—

Ches Crosbie  
All right. So I’ll just follow the usual format I have been following and ask you to affirm that you will tell the truth, the whole truth, and nothing but the truth.

Pastor Jason McVicar  
Yes.

Ches Crosbie  
Thank you.

Criss Hochhold  
Good afternoon.

Pastor Jason McVicar  
How are you?

Criss Hochhold  
Can you please state your full name for us?
Pastor Jason McVicar
Sure. My name is Pastor Jason McVicar.

Criss Hochhold
Where do you live?

Pastor Jason McVicar
Just outside of Charlottetown, Prince Edward Island.

Criss Hochhold
And what do you do for a living?

Pastor Jason McVicar
I’m a pastor.

Criss Hochhold
Pastor McVicar, you are living in PEI at this time. Where were you prior to moving to PEI?

Pastor Jason McVicar
Well, I’m from New Brunswick, and for 11 years I did ministry in New Brunswick Fredericton.

Criss Hochhold
You were a pastor at a ministry in Fredericton?

Pastor Jason McVicar
Yes, for 11 years.

Criss Hochhold
For 11 years? Can you tell me more about your time at the church in Fredericton, please? And specifically, I'm interested in incidents that happened to you regarding your status.

Pastor Jason McVicar
Sure.

Pastor Jason McVicar
With regard to COVID and the pandemic and everything, my experience is pretty unique in that I minister to a lot of people who— The church existed in a low-income area. When the mandates all came rolling out and the lockdowns came, there were a lot of people who were adversely affected by all that stuff.
And so I was ministering to a lot of people and people are in really hard ways. I was dealing with people who were struggling with suicide. I was struggling with domestic abuse from the lockdowns, people just being locked up together—it was mostly older people who were doing that—and extreme loneliness from the older community as well. So I'd seen firsthand kind of the negative effects of all the policies that were coming down from the government. It never really affected me. Our family was fine. We just rolled with the punches as they came.

It wasn't until the end of September when the mandates for the vaccine came into effect. And Dorothy Shepherd, on behalf of the Government of New Brunswick, had approached the faith communities and had approached churches. And basically, in an effort to get the vaccine uptake to 90 per cent, they wanted churches to promote the vaccines among their congregation. They encouraged vaccine mandates. Then the government had implemented a policy that said if churches would require proof of vaccination, they could operate full capacity—no restrictions, no masking, nothing. But if they weren't going to implement the proof of vaccines, then they would have to go back to their operational plans.

And that's when my experience went from ministering to people who were struggling with these different mandates and these different policies to just being on the receiving end of some of those negative outcomes. It all began October 3rd. So short, but very little, I'd say eight days after Dorothy Shepherd had approached the churches, I had received a letter from our board basically making my vaccination status the new measure of my ministry and my character. And they had included in this letter—Well, they had indicated that the vast majority of the congregation and the vast majority of the board felt that vaccination was the only way out of this pandemic. And that my opinions with regard to the whole pandemic, but mostly my refusal to receive the vaccine, was causing huge troubles in the church.

And I'll just read you some quotes to give you an indication of how they redefined—not redefined, they just made it the measure of my ministry and my character, the fact that I wouldn't get vaccinated. So in terms of ministry, they said, quote—

\[00:05:00\]

"That I was exercising poor judgment and a lack of discernment, that I had created deep wounds in your flock, that I had created barriers to you being able to teach, nurture and guide, that it was a lapse of wisdom, that it was a portent of future errors that could affect you on the pulpit, that it was an erosion of trust and confidence, that it was creating division in the congregation, and that there was a need to repair and rebuild the congregation."

**Criss Hochhold**

*Just for the Commission, the document Pastor McVicar was referring to has been entered into electronic evidence and will be available to you [Exhibit TR-0012].*

**Pastor Jason McVicar**

*In terms of my character, the letter went on to say that I was placing my physical health before that of the congregation, and that I was placing my own physical health before that of my own children and the children in the congregation.*
Criss Hochhold
Before this, Pastor McVicar, I just want to ask a question. Because you had been there at that for about 10 years?

Pastor Jason McVicar
Yes. Well, this was actually the anniversary of my 11th year, that all this was happening. But it was 10 years. It was really good years. No conflicts, no—like, there just there were no issues whatsoever.

Criss Hochhold
So the board now attacked your character rather significantly, and—

Pastor Jason McVicar
They just redefined it. Because 10 years, it was fine. Like, had a great relationship with the congregation, good relationship with the board. It wasn’t until my refusal to be vaccinated that suddenly my character and my ministry took on this whole new light.

Criss Hochhold
So in the 11 years prior, you've taken this parish, this community of faith and you've built it. And what did you build it from, and how did that come about?

Pastor Jason McVicar
Well, they'd had a tumultuous period where it was basically just a mass exodus of their congregation. And I had come about two years after that had happened and they were down to—I'm not even sure—it was around 20 people or something like that. And over the years we were just rebuilding, and we had gotten it up to—Well, just prior to the pandemic it was around 45-50 people. And then the pandemic came and just had crazy swings after the pandemic.

Criss Hochhold
So you had a significant increase from when you initially took it over until the end.

Pastor Jason McVicar
Yeah, we were making good progress.

Criss Hochhold
You said—During that time, had the board ever had any other sanctions or complaints about how you led the ministry, how you interacted with the members?

Pastor Jason McVicar
No, nothing formal. There is, like, differences of opinions about little things, but it's all—No, nothing formal. No reprimands, no anything. Literally no conflict with congregation.
Criss Hochhold  
So no poor judgment and no lack of discernment?

Pastor Jason McVicar  
No. Everything that was laid out in this letter was purely related to the vaccine, had nothing to do with my actual ministry.

Criss Hochhold  
When you say it was purely in the letter—actually, it had nothing to do with the ministry.

Did the board present you with any evidence from the congregation to support the allegations that they've levied against you?

Pastor Jason McVicar  
No. Well leading up to it, I wasn’t shy about my opinions outside of the church setting about how I felt about all these restrictions and how I felt about the vaccine. And so, we disagreed on that. And there was constant pressure—Once the vaccines came into effect, there was constant pressure from the board, especially for me to get the vaccine. And I refused for the longest time.

It was mostly just because I was so healthy, all the evidence that I had seen in terms of pure numbers. I didn’t watch TV, so I wasn’t really subject to all the fear-mongering that was going on. I went to the government website and just read the numbers. So I made my choice based on those numbers. So the pressure was constant. It wasn’t until the government kind of approached the churches that it went from just them disagreeing with—I had no idea that they felt this. I knew they disagreed with me and I knew that it was frustrating for them.

They had required three things of me in this letter. They said that they wanted me to outline steps that I’ll take to create a path to healing the wounds described above. And they wanted me to detail how I would perform my pastoral duties.

[00:10:00]

And they wanted me to elaborate on what I could do to ensure the congregation’s physical health—again, because I’m unvaccinated and apparently dangerous. And so, I wrote them a letter. I just answered their three questions. I let them know that as far as the steps that I’ll take to create path to healing, I didn’t know the congregation—I knew they had problems with how I was—with my views. I didn’t think it would affect my pulpit or my ministry at all. I just thought it was a disagreement about a worldly matter. But I had no idea the congregation, that they were—

So anyway, I wrote them a formal response. I said, “As far as healing the wounds, I don’t know who’s hurt, I don’t know who’s so offended.” Like, “All of these things that you’re putting before me, I don’t know who I would approach. I don’t know who—It feels like nobody’s coming to me with this stuff.”

I had no idea that people took so much offense to the choice that I made.
Criss Hochhold
The congregation didn’t, again, didn’t—

Pastor Jason McVicar
Yeah, there’s no indication. Again, everybody— I knew that I was the minority view. I just had no idea that it was the measure of my ministry and my character at that point. And I said that I just had no idea how I would heal wounds that I didn’t know existed. But I also say— As far as the second one, they said they wanted me to detail how I’d be able to perform the pastoral duties.

It was simple: the government had laid it all out and they had given us an ultimatum. They said, “If you require vaccination—and you require proof of vaccination” that “you could operate full capacity.” I said, “I won’t be vaccinated, so if you’re going to require proof of vaccination, I can’t even minister so that’ll take care of that. But if you don’t, if you take option B, we’ll just do what we’ve always done. We’ll do the operational plan.” Which I wrote.

Criss Hochhold
So they gave you the ultimatum that essentially you need to get vaccinated. If not—

Pastor Jason McVicar
No, they never once said I have to get it, they just they kept asking and asking and asking. And the way the letter was written, it was obvious that that was the outcome they were going for. What they were trying to portray was that my ministry was in shambles. What they were trying to portray was that my ministry was going to be impossible without vaccination.

The other thing that they asked was to, “elaborate on what you can do to ensure your congregation’s physical health.” I just I told them that was absurd. Like, you guys can’t ensure your physical; you can’t ensure, neither can I. Nobody can ensure people’s physical health. I told them I would do the things that I have been doing. I’ll abide by all of the actual practices that we had implemented, the operational plan. I’ll do the physical distancing when it’s required. I’ll do the masking when it’s required.

Even when it came to my vaccination status, I was always very forthright with people. I put the ball in their court. I wanted them to know that if they were uncomfortable with my vaccination status, I had a colleague, a pastor friend who would be more than willing to minister to them in person if they wanted. Like, everything was in place to, as far as— Even though I didn’t believe that stuff about me being more dangerous, if they felt that way, I accommodated them.

Criss Hochhold
So you took steps, you said, for people that were not comfortable with you. You said a one-on-one.

Aside from having a congregation on your typical Sunday, church time, you also provided services to people on a one-on-one basis?
Pastor Jason McVicar
Oh, yeah, I did a lot of counseling. There were corporate ministries that I would engage in. So I would do the Sunday service: preaching, teaching, I'd be on the stage with them leading in worship and stuff. And then there'd be the Bible study, and then we had a prayer group as well but I didn't lead that. I had somebody else leading that. And the rest was all one-on-one stuff. A lot of people from the community—especially when COVID hit, there were a lot of people. Once word got out that there was a pastor in town that would hear you out instead of wait for their turn to tell you why you're wrong about the vaccines, they started coming to me. And that's when I started dealing with people who had such crazy struggles. And plus, it was the neighborhood I was in. I was already very well-known, very well-liked in the community, and people were in and out all the time.

Criss Hochhold
Did you advise the board members that you had made arrangements for a vaccinated pastor to take over counseling or other sessions for you if the person you were going to see wanted counselling?

Pastor Jason McVicar
Yeah. Well, when they had written that letter and I wrote my response. At the end of the response, I told them. I was like, “It's very clear from this letter there's nothing good is going to come from me defending myself.

[00:15:00]
And you've already made it super clear that my judgment in this regard has put me in a place where my ministry is not even— Like, if this is the new measure of my ministry, you shouldn't want me to be your minister.” And so, I said, at the end of that letter, I was like, “I don't see a path forward.” I basically said, “It seems to me that nothing short of me taking ownership, taking responsibility for all of these so-called hurts and all of these—”

Criss Hochhold
How about I read it? Pastor McVicar, I have it right in front of me. I can read it.

Pastor Jason McVicar
What's that?

Criss Hochhold
I said, I have it right in front of me. That way you don't need to try and refer to memory?

Pastor Jason McVicar
Sure.

Criss Hochhold
Again, this is entered as an electronic exhibit [Exhibit TR-0012i]. And it's, quote: “To be frank, your letter strikes me as unrealistic, unreasonable, and unfair. It's clear to me that nothing good will come from me defending myself, and by your own account, nothing good
I'm sorry. You were unvaccinated yourself and they asked you not to meet with other unvaccinated people. Criss Hochhold

What was the result of your reply to their letter?

Pastor Jason McVicar

Well, they had called it a closed-session meeting. So I went to the meeting. It was just the board and myself. They took my phone, because they didn't want it recorded. Anyway, it was one of the craziest things I've ever experienced in terms of—I consider it to be abusive. It was, just, they took turns basically reiterating everything they had written in the letter, but it was so much more. Anyway, it was, it was—

Criss Hochhold

What happened within the meeting? Can you give us a brief summation of what happened? And how did you feel about it when you were there? Were you heard?

Pastor Jason McVicar

Oh, yeah. I considered it abusive, to the point where—

Criss Hochhold

Abusive, sorry?

Pastor Jason McVicar

I just let them say their piece after a while. I didn't say anything after a while. And when they were done, I reiterated that I wouldn't be getting my vaccine and that they need to deal with that, that they seem to be hyper-focused on this idea that I can be convinced. It was funny, like even at that time, it wasn't even that I was refusing the vaccine entirely, I wanted to see how the winter played out. Because Omicron was already happening in Europe. Like all these numbers were rolling in, and I was like, "I don't even want to revisit the issue until the spring time." I said, "For now I'm not going to get it, and you need to deal with that, and you need to decide what you want to do. Because it sounds like if you really believe what you wrote in this letter, I'm not fit for ministry. If this is the new measure of my ministry and character, I'm not fit. And so, you need to deal with that reality."

After that they asked me to leave the meeting and I did. And I waited that night for, kind of, confirmation of what they had decided—and I didn't get it until the morning. And they had decided that they didn't want to do anything rash and so what they would do instead is they would move everything online, except for the prayer group, because I wasn't part of the prayer group. So they moved it all online. They asked me not to meet with anybody in person, especially unvaccinated people.

Criss Hochhold

I'm sorry. You were unvaccinated yourself and they asked you not to meet with other unvaccinated people?
Pastor Jason McVicar
Yeah. They ask me not to meet with anybody in person. Basically, self-isolate.

Criss Hochhold
Okay, so was there a reason given why you shouldn’t meet with—?

Pastor Jason McVicar
No. Because at this time everything was starting to open up a little. Everything was open in the government, everything was open in businesses, everybody. It was only our church. As far as I know, there was no other business, no other church, no other government entity that was shutting down. It was just our ministries that were going to shut down. So they shut it all down, asked me not to meet people in person, so I did everything online.

And after that— I’m kind of losing my train of thought here.

Criss Hochhold
So you left the meeting. You were waiting to hear something back from the board that particular night to see how you are moving forward.

Pastor Jason McVicar
Yeah. They wanted to shut it down for four weeks, and they started kind of piling on these restrictions. And so, I had assumed that was a response to my letter. Because in the letter, I had responded to them saying, like, we’ll just do ministry the way I’ve been doing ministry. We’ll abide by the government’s policies, and we’ll just keep rolling forward with our operational plan. And when it’s open, we’ll be open. And when it’s closed, we’ll be closed. And we’ll do what we’ve done for the past six months or four months, or however long it was when we had the operational plan in effect.

And so, they started piling on all these new restrictions of their own accord.

[00:20:00]

Just based on their own opinions of so-called numbers. And I had moved the online, especially for church. I moved it ahead an hour, because nobody else in the city was closed, so I wanted to take my family to church. And so, I moved the livestream ahead an hour and I took my family to church. And I got an email that afternoon, I think it was, from the board asking why I had moved the livestream ahead an hour. And I told them I wanted to take my family to church. After that, I received another letter reiterating those three things. Again—they asked me again, “We want you to,” you know, “tell us how you’re going to protect the congregation. We want you to tell us how you’re going to do ministry.” So it’s essentially, like, “Here’s a whole bunch of new restrictions. Now how are you going to do ministry?”

Criss Hochhold
Pastor McVicar, ultimately, what was the outcome of the conversations in the meetings between you and the board?
**Pastor Jason McVicar**

At the end of the meetings, I wasn’t going to resign, because I didn’t think I did anything wrong. If they were going to make this the measure of my ministry, I wanted them to fire me for it. Like, if this is the new measure, you’re going to have to deal with it. Like, you’re going to have to be the ones who initiate all of this. And so, at this point, I’m just—I’ve lost 20 pounds. I’m a guy who can’t afford to lose 20 pounds. Like, I was the most stressed I’ve ever been in my entire life. My ministry was in shambles, as far as I knew. So I decided I’d call a congregational meeting, because it was clear they were trying to force something but they weren’t going to be the ones who wanted to initiate it. I wasn’t going to quit. And so, I wanted a congregational meeting. I wanted to bring them into it and say, you know, “Is it appropriate for this to be the new measure?” If they agree, then vote me out. If you disagree, let’s move on, and let’s put this behind us.

**Criss Hochhold**

And the meeting that you’re referring to, congregational meeting, what is that comprised of?

**Pastor Jason McVicar**

Anytime you have a decision that needs to be made that affects the whole congregation, you bring the congregation together with the board and you talk about it. You work it out. You hash it out. You create the agenda. You create the documents you need. And so, that’s what I did. I had emailed the board and I told them, “I’m calling a congregational meeting. I need you guys to provide these documents.” I was like, “I need you guys to be the ones who call the meeting, because you guys have been speaking on behalf of the congregation. You’ve been acting on their behalf, so you guys are going to be the ones to do this.”

And they denied that. They said, “No, we’re not willing to call a congregational meeting.” I told them, “You need to revisit the Constitution.” I’m like, “I gave you the option to do it, because you’ve been talking on behalf of the congregation. But I’m calling a congregational meeting one way or another.” They said no. They said they wanted to have another meeting in person. And I said no, I wasn’t going to do that after the last meeting. I was like, I’ve been advised by people not to ever put myself in that position again.

**Criss Hochhold**

Pastor McVicar. Sorry to interject, but in the interest of time, you ultimately decided to part ways with this church.

**Pastor Jason McVicar**

At that point, I was just done. I was, like, I can’t do this anymore. It’s too stressful—my wife, my family, all of it was brutal. It was the most brutal thing I’ve ever experienced, so I just wanted to be done. So I didn’t even get to the congregational meeting.

I called up my father-in-law, who’s dealt with this stuff before, and got him to mediate a mutual parting of ways, a mutual agreement to terminate the contract. So fast forward to—I forget the exact date. I’m signing this contract and I’m getting a bunch of text from the congregation congratulating me on my new endeavors. I’m like, “What are people talking about?” And I get several of these texts as I’m signing this document. Finally on my way out, I get another text from somebody asking me if this was really a mutual agreement—like, if the agreement was actually mutual. And I said, “no.” And they said, “Do you want to talk?”
So, I got together with them, and they showed me the newsletter where they announced my parting of ways [Exhibit TR-0012g].

**Criss Hochhold**
I can read that out actually.

**Pastor Jason McVicar**
Yeah, could you read that? Yeah.

**Criss Hochhold**
That’s right. And that was on October 27th. The letter—the parting ways that the board chose to award—was as follows: “Jason’s contract has ended by mutual agreement, as he has accomplished all that he can in this ministry, and he will now move on to new endeavors. We thank Jason for his years of service and wish him all the best in his future plans.”

[00:25:00]

**Pastor Jason McVicar**
So they just flat out lied to their congregation. And I kept on getting these texts and these messages congratulating me. So I didn’t know how to correct them because I didn’t want to be—anyway. So it was just this big mess. And ultimately, over time, and talking with people had discovered that nobody knew. It was just these individuals on the board were acting on their own—their own accord. The congregation, 100 per cent on the deck, had no idea that any of this was even happening in the background. So I had been misled by this letter that had portrayed my ministries in total shambles. Like the congregation was completely in the dark. And now they had lied to the congregation about the nature of my leaving.

**Criss Hochhold**
So Pastor McVicar, what I hear you saying is that they’ve lied to you and they’ve lied to your congregation.

**Pastor Jason McVicar**
Yeah. Like, I never would have entered into mutual—if I had known that, especially after talking to people face to face from the congregation, that even though they disagreed with me, this never would have been the approach they would have approved of.

This never would have been the way they would have wanted it done. I never would have entered into those—Like, my ministry was destroyed over this stuff. And, I never would have gone down that path.

**Criss Hochhold**
Thank you, Pastor McVicar. Unfortunately, we are out of time. I would like to defer to the commissioners for any follow-up questions.
Commissioner Massie
Thank you very much for your testimony. I'm religious, but I'm not practicing like a pastor.

Pastor Jason McVicar
That's how everyone who is not religious talks to me. They always put that caveat.

Commissioner Massie
I'm a believer. I'm a believer, but I'm a scientist, and I have a hard time to wrap my head around what you're telling me. Because it seems to me, based on the level of understanding from your people on the board, that I don't think—correct me if I'm wrong—that they have a deep understanding of the science behind what they are promoting.

Pastor Jason McVicar
Well, one of them was a pharmacist, so he had some understanding, but most of them are just lay people.

Commissioner Massie
Would it be fair to assess that this is more based on faith?

Pastor Jason McVicar
Trust. They gave implicit trust to the people who are talking on TV.

Commissioner Massie
Okay. I'm not a scholar of the Bible, but my understanding is that the reason why humans are alive today is because they benefit from a God-given natural immunity. Have they ever heard of that?

Pastor Jason McVicar
They saw it in me. I never got sick. I never got COVID.

Commissioner Massie
So it seems to me that what you are experiencing—correct me if I'm wrong—is a struggle of faith between two different beliefs: belief in natural immunity, God-given natural immunity, and I can assure you, there's a lot of science behind it—

Pastor Jason McVicar
I don't want to speculate on beliefs or anything like that. In the end, they just followed through on what the government put out there. And they did it in what I consider to be a super unethical way, and it kind of blows my mind that they would do that. Never in a million years would I have thought that would have been the way—But I don't know. I don't know what their beliefs are. Like, their motivations, their intentions, that stuff is God's territory. All I care about is what they did.
**Commissioner Massie**

So what is your option moving forward for your ministry or other ministry?

**Pastor Jason McVicar**

I’m in full-time ministry now. We ended up moving to Prince Edward Island to be closer to my wife’s family. And from the moment I got there, I was filling pulpits, preaching, and I was asked to apply to a few different churches. And I was super frank. I was like, I’m not dealing with this stuff ever again. I told them, “If I put my name in, you got to tell your congregation exactly where I stand on all this stuff. I’ll never preach it. I’ll never be—I’ll never be heavy handed. I don’t care what people believe about this stuff. They make their own choices. I just want to be left alone with mine.”

I wanted them to understand. I was like, “You just got to make sure they know that I’m not vaccinated. I probably never will be vaccinated, not with this mRNA stuff. Because in the end, nobody cared.” There were several churches who were asking me to apply, even knowing that.

**Commissioner Massie**

Okay, thank you.

[00:30:00]

**Criss Hochhold**

No, there are more questions coming.

**Commissioner Kaikkonen**

I was just wondering—there’s a couple of questions I have. The first one: is there anything in your contract with the church in Fredericton that would suggest this may be a problem if your faith goes against what the world is promoting?

**Pastor Jason McVicar**

Actually, I stayed away from faith statements about why I wasn’t being vaccinated. So there’s nothing in the contract that would say anything like that. And I stayed away from it. Because, speaking from a place of faith, the Holy Spirit informed the decision I made, but I never appealed to that because I can’t. I can’t. It’s an appeal to an authority you can’t confirm. So, I just never did, I stayed purely with the numbers. “I’m healthy. I don’t need the shot. They don’t stop infection. They don’t stop transmission, so you’re no more protected with me vaccinated than unvaccinated.” Those are my two reasons for not— Yeah, so, I stayed away from it.

**Commissioner Kaikkonen**

Okay, my second question is: Do you know if the government offered financial incentives to set up church buildings as vaccination centers?

**Pastor Jason McVicar**

No.
**Commissioner Kaikkonen**
You're not aware?

**Pastor Jason McVicar**
I'm not aware, no, and nobody ever approached us—or at least, not that I was aware of.

**Commissioner Kaikkonen**
I believe that some of the arguments for churches closing fell to Romans 13. I believe that's right. I'm just wondering what your thoughts are when Christian churches or faith groups would raise the first couple of verses in Romans 13 as an argument for following the leadership of our secular governments.

**Pastor Jason McVicar**
I did. And we did: We implemented the operational plans. We followed everything. There was no mandate for the church. Nobody mandated anything within the congregation and the government didn't mandate anything for us. So that's not an argument.

**Commissioner Kaikkonen**
Okay, and then my final question is, you suggested that the mandates in New Brunswick were decreasing at a time that these restrictions within the church were increasing. I'm just wondering: At any point in this journey that you've just gone through, did you feel like the health authorities or the province were targeting the church or that there was religious—?

**Pastor Jason McVicar**
Oh, they definitely targeted the church. For one—I don't know what it was like in other provinces, but I know in New Brunswick—a huge portion of the unvaccinated population were from the faith community. And Dorothy Shepherd approached the faith community specifically, asking that they promote vaccines to their congregations and encourage them to require proof of vaccination in order to boost those numbers to 90 per cent. So they most definitely targeted the churches.

**Commissioner Kaikkonen**
So are you aware of other churches that went through this same struggle between the congregations and the ministers as a consequence?

**Pastor Jason McVicar**
There was only one other church that I knew of that went down the road that my church went down. The rest just navigated it fine. Actually, the church that my family and I landed in after all of this stuff, they were the exact same scenario as us. Their pastors were unvaccinated. They just handled it in a way more mature way.

**Commissioner Kaikkonen**
Thank you.
Criss Hochhold
Thank you, Pastor McVicar. I appreciate your time this afternoon.

Pastor Jason McVicar
Thank you.

[00:34:01]

Witness 13: Bliss Behare
Full Day 2 Timestamp: 08:04:40–08:16:22
Source URL: https://rumble.com/v2djjsi-nci-truro-day-2.html

[00:00:00]

Ches Crosbie
Mr. Behare, you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Bliss Behare
Yes.

Ches Crosbie
Thank you.

Alison Steeves
Can you tell us your full name, where you’re from, and your occupation?

Bliss Behare
I’m Bliss Behare, I’m 18 years old, I’m from Baie Verte, New Brunswick, and I’m a seasonal kitchen worker.

Alison Steeves
And when did you graduate from high school, Bliss?

Bliss Behare
I graduated June 2022.

Alison Steeves
So you were in high school during the height of the pandemic roughly, early 2020 to spring 2022?
Bliss Behare
Yes.

Alison Steeves
Can you tell us a bit about what your life was like before that time—before the pandemic started?

Bliss Behare
Prior to COVID, I was really active in my community both within school and outside of it. I campaigned for the Green Party. I organized and spoke at protests for the environment. I was part of art groups and I performed at music festivals. Within school, I was part of band, choir, eco groups. So between those social activities and school, that was mostly what my life consisted of.

Alison Steeves
So then in 2020, when we begin to hear about COVID-19, were you concerned?

Bliss Behare
I was never concerned for myself, given that I’m a young healthy person, but I was possibly concerned for my parents as they’re middle-aged.

Alison Steeves
And when the vaccines came out, did you choose to take any of the available vaccines?

Bliss Behare
I did not.

Alison Steeves
How come?

Bliss Behare
I’ve always been raised to be skeptical about vaccines, so to me it’s a case-by-case situation. And having seen that the process was rushed, I wanted to wait at least a year to see the rollout of the vaccine. But before I had time to make my own decision, it was mandated. And once it was mandated, I knew I would never accept the shot because I would never accept a forced medication.

Alison Steeves
What sources did you consult in making your decision?

Bliss Behare
There were a few sources. I did consume both mainstream media and also alternative views on YouTube, such as doctors like Vinay Prasad, and I spoke about that with my
In fall 2021, around the time that Nova Scotia announced that there would be a vaccine passport for several services and other things, what grade were you in?

**Bliss Behare**
I was in Grade 12.

And did you observe any impact in school life, in the atmosphere in school, in the school setting at that time after the announcement?

**Bliss Behare**
Yes, so nothing was really noticeable, people didn’t want to talk about it, but once the mandates were in place—one unvaccinated students were banned from extracurricular activities—the issue was just brought forth right to the front of the stage. And it sort of ousted unvaccinated students to all the rest of their peers.

And did that sort of create any tension in the school?

**Bliss Behare**
It did for me. I didn’t know any other unvaccinated students, but I wanted to avoid being ousted so I dropped out of school and switched to online classes.

Were you registered in any activities at that time, for the fall?

**Bliss Behare**
I was registered for theater, art club, music, so yeah, a few things.
Alison Steeves
And outside the school? Anything outside the school?

Bliss Behare
Nothing at that point.

Alison Steeves
And so you dropped out of school to avoid being outing because you were worried about how you would be treated if people knew your status?

Bliss Behare
Yeah, I knew that I would meet a lot of negative reactions, so I did want to avoid that.

Alison Steeves
And exactly when did you drop out?

Bliss Behare
I would say sometime in October.

Alison Steeves
And can you list sort of what type of activities you had intended to do, or that you would normally do around the fall at that time?

Bliss Behare
Yeah, there was a lot of things. Usually, I would have been preparing to perform at the music festival for the Royal Conservatory of Music. I was probably going to have another art show that was outside of school.

[00:05:00]

I was going to participate in theater and likely organize eco protests as well, so kind of the regular things I would have always done.

Alison Steeves
And so you were not allowed to participate in any of those things at this point.

Bliss Behare
Yes.

Alison Steeves
And what was that like? How did that feel?
Bliss Behare
It was very isolating, and it was just incredibly lonely.

Alison Steeves
At this time, what were you seeing in the media or on social media about vaccine-related topics or people who choose not to take the vaccines?

Bliss Behare
I saw a lot of hate and contempt for unvaccinated people. Every once in a while, when I’d scroll through, I would see videos that said unvaccinated people deserve to die, that they are idiots, that they’re just unlikable people that take up space. One person said they were glad that we were banned from things because they didn’t want us to be around, so things of that nature.

Alison Steeves
And was this sort of in the main internet or were you seeing any of this sort of coming from the mouths of people you knew?

Bliss Behare
It was primarily online, yeah.

Alison Steeves
And how did that make you feel?

Bliss Behare
For me personally, I was pretty hypersensitive, so I felt physically shaken. Even sometimes for two days, I might have a migraine or feel very nauseous sometimes.

Alison Steeves
Yeah, just witnessing sort of the types of things people were saying.

Bliss Behare
Yeah.

Alison Steeves
Did your decision not to take the vaccine have an impact on any particular relationships in your life? Friends or family?

Bliss Behare
I would say that it had an impact on every single relationship in my life except that with my parents. But besides that, everyone looked at me differently and could hardly look me in the eyes, frankly. So a lot of interaction was cut back because of it.
Alison Steeves
Do you have any specific examples?

Bliss Behare
So there was one person who I had reached out to after I dropped out of school to meet up with. I told her that I was unvaccinated because I knew it would come up anyways, but she told me that her mom banned her from seeing me.

Alison Steeves
After you told her you were unvaccinated, she—

Bliss Behare
Yeah.

Alison Steeves
And how did that feel?

Bliss Behare
That was really disheartening because I know that most young people didn’t want to know me at that point because of my status. So I was excited to hear that she didn’t judge me on the matter, so it was really disappointing to learn I lost another friend.

Alison Steeves
So she had originally known and was fine with it, but then later on had told you that she was no longer allowed to hang out with you.

Bliss Behare
Yeah, that’s what she told me.

Alison Steeves
Have these measures impacted other aspects of your life?

Bliss Behare
I would say it impacted every aspect except physical. So primarily, social aspects were the hardest, such as losing all the groups that I was a part of. But also financially because my father was put on leave without pay. So as a family, we struggled. And as far as my future, that was also impacted as far as university and just any sort of future plans that I had after high school.

Alison Steeves
And why were those impacted?
Bliss Behare
I was generally banned from universities, and any connections I’d made with people, say like in the art or music world, was cut off.

Alison Steeves
And can you describe a specific day or instance that was particularly challenging in all of this?

Bliss Behare
One of the hardest days for me was when my mom and I were discussing university opportunities. And I was on and off negative about it, but I generally really love education, so I was excited, and we discussed a particular university and we’re starting to get inspired by it. But then we went online to look up the COVID policies, and we found that I was banned not just from the physical classroom, but also banned from online classes. So that was disappointing.

Alison Steeves
So at this point in time, with everything up in the air, no indication of when these requirements are going to end, what was your outlook? How were you feeling about the future?

Bliss Behare
I felt like I was in despair. I felt very bleak. I really felt, especially considering there was more threats and more possible exclusion, I felt that there would never be an end to it. And because I felt that way, because I felt like our future, not just personally on my note but as a country, our future was bleak, I did feel fairly suicidal because it seemed that it would never end.

Alison Steeves
Now that many of the measures have lifted and they’re sort of less focused on COVID, would you say your life has returned to normal, or would you say that you experience any ongoing impacts?

Bliss Behare
In some ways it definitely has gone back to normal, which I’m grateful for. I have a job; I’m going to college and those were things that I wanted. But internally as far as my mindset, I think I’m changed forever.

[00:10:00]
I think I may never ever trust my government again or trust any institution in Canada unless I see justice and restitution. But I’m still grateful for the physical things that have changed, such as the mandates lifting.
**Alison Steeves**

And I wanted to ask, is there any particular activity that was particularly painful or difficult for you to be excluded from, or were there any particular instances of not being able to participate?

**Bliss Behare**

The hardest for me was music because for me, and for most people, music is about playing music with each other and collaborating, and it's a very beautiful experience. So my tutor who I had who taught me clarinet for about seven years said we can no longer do in-person classes together. That was very rough for me especially. Also, I couldn't perform at the music festivals or anything like that, too.

**Alison Steeves**

That was that tutor's personal choice or was it a requirement?

**Bliss Behare**

For my tutor it was personal choice.

**Alison Steeves**

Is there anything else you'd like to add?

**Bliss Behare**

I guess, I would just say that, although in those moments I felt that there was really no hope, having seen the convoy and having seen movements like this, like the National Citizens Inquiry, I am given a lot more hope.

**Alison Steeves**

Thank you, Bliss. I'll turn it over to the Commission.

Thank you.

[00:11:38]

Witness 14: Joe Behare
Full Day 2 Timestamp: 08:16:38–08:33:00
Source URL: https://rumble.com/v2djisj-nci-truro-day-2.html

[00:00:00]

Ches Crosbie
Mr. Behare, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Joe Behare
Yes.

Ches Crosbie
Thank you.

Alison Steeves
Can you tell us your full name, where you’re from, and your occupation?

Joe Behare
Joe Behare. I’m from Baie Verte, New Brunswick, and I’m a civil servant in the federal government.

Alison Steeves
And how long have you worked for the federal government?

Joe Behare
Twenty years.

Alison Steeves
The same department or you moved around?
Joe Behare
I did one brief stint in another department just during COVID.

Alison Steeves
So primarily in the same department?

Joe Behare
Yes.

Alison Steeves
And you were in this position in 2020–2021?

Joe Behare
Yes.

Alison Steeves
How would you describe your experience working there prior to the pandemic and up to that point?

Joe Behare
It was positive, you know. I enjoyed my job. I had become a manager in my department and built up some good relationships both with colleagues and with clients. So it was very positive.

Alison Steeves
And in 2020, as you began to hear about COVID-19, were you concerned?

Joe Behare
With COVID? Again, not for myself. Maybe for others like my wife and my mom, but not overly concerned, no.

Alison Steeves
So when the vaccines became available, did you take one?

Joe Behare
No.

Alison Steeves
At what point did you realize that your decision not to take the vaccine might cause problems for you?
Joe Behare
I didn’t— Right up until the time that I was put on leave without pay, I didn’t believe that—I couldn’t believe that anything would be done that I would be negatively impacted.

I did see that there was a lot of negative stuff in the media and even in personal interactions that I’d had. But I didn’t think, you know— I didn’t think I’d lose my job.

Alison Steeves
And do you recall when the federal government announced the mandates for federal workers?

Joe Behare
I remember my wife saying she’d read something in the paper about this being talked about sometime in September—I guess, or so—of 2021, maybe October. I don’t remember when the election was at that time—sort of right after the election.

I remember saying to her, “There’s no way that’s going to happen. I’ve got a union and we have courts in this country. We’ve got a Charter of Rights. They can’t do that.”

Alison Steeves
So you weren’t concerned?

Joe Behare
Not really, not at first. Not when I heard that, no.

Alison Steeves
And the time that they officially announced the mandate, were you working in the office?

Joe Behare
No, at that point nobody was. At that point I was on a secondment agreement with another department and the office was in Dartmouth. I was in Baie Verte. It’s a two-hour drive away, so there was never a question of being in an office. We were all working remotely at that point.

Alison Steeves
And did you inquire as to whether you’d still be subject to the mandate even though you were not going into the office? Did you request accommodation on the basis that you were not going into the office?

Joe Behare
Yes, I mean— I did sort of— I did try and make a case that this was not a matter of workplace safety, and so there was no rationale for a mandate. There was some case law as well by that time that sort of backed up my point. I didn’t expect to be accommodated, but I still made the case.
Alison Steeves
And what was the response?

Joe Behare
“Sorry, this is the policy. There’s no accommodation.”

Alison Steeves
Had you offered to do anything such as masking when you go in, or social distancing?

Joe Behare
Sure. I did note that we were working remotely. But if I was required to go in the office, I said, “I’ll do tests. I’ll do tests at my own expense. I’ll wear a mask, et cetera.” Everything like that.

But that wasn’t the point of the policy. The point was to try and coerce you into taking the vaccine. So it wasn’t about being healthy or public health, that wasn’t what it was about.

[00:05:00]

Alison Steeves
So you offered to do testing as well and still—

Joe Behare
Yes, if I ever had to attend at the office—which, by the way, I never did.

Alison Steeves
So you were ultimately placed on leave without pay?

Joe Behare
Yes.

Alison Steeves
And can you tell us a bit about the day when you were placed on leave?

Joe Behare
So the day was November 17th and that was to be my last day.

I remember working in the morning to finish up doing something and then sort of leaving— Or thinking that in the afternoon I would take some correspondence, some personal emails, some phone numbers, and contacts off of my computer and from my files at work. I’d kind of planned to do that; that’s why I didn’t do it in the morning, because I had other things to do from a work perspective.
But then, when I went to do it, I was completely locked out of the system. My phone was wiped. It was almost like I was cancelled. So I couldn’t get any of those things done. I didn’t have any access to things like my leave balances or, even later, any of the HR stuff I needed like T4s, stuff like that.

**Alison Steeves**  
So they had locked you out before you had even left?

**Joe Behare**  
Yes. But they did it in such a way it was very, kind of pre-emptive. They didn’t even wait till the end of the day. I assumed I had until the end of the day, which would have been four o’clock.

It felt very punitive that it was done in that fashion.

**Alison Steeves**  
And how were you feeling that day and that night after being placed on leave from this job you’d been working at for 20 years?

**Joe Behare**  
I mean, again, like I said: I didn’t believe it would happen until it happened. People were telling me, “Oh, there’s no way they can do that. Don’t worry. That’s not going to happen.” But by then, I thought that it would happen.

So it felt very— It felt real when it did happen. The aftermath was quite— It was probably the most shocking day to realize that I was in fact left without pay and just at that time of year too.

**Alison Steeves**  
Are you unionized?

**Joe Behare**  
How do you mean?

**Alison Steeves**  
Do you have a union, sir?

**Joe Behare**  
Oh, yes. Yes. Sorry, I thought you said something else.

**Alison Steeves**  
No. And did you talk to your union about filing a grievance?
Joe Behare

Yeah, so at first, the union declined to represent people like me. They said they were in agreement with the policy. But a bit after that, there were a few cases that came through in the courts that basically said workers were working from home; it wasn’t right that they be subject to a mandate; that the employer didn’t own them. And, you didn’t sign away your rights when you’ve signed a labour contract.

So the union kind of changed its mind and said it would represent us on a case-by-case basis. And I filed a grievance at that time against the policy. So that would have been early December.

Alison Steeves

Have you had any results from your grievance?

Joe Behare

No, and it’s been over a year. Obviously, everybody is dragging their heels on it. Even though the collective agreement has set time limits for responding to first, second, and third level grievances, they didn’t respond. They still haven’t responded to the third level grievance. I kind of didn’t expect anything from those grievances. I wanted to take this to a labour relations board, but the process is that you had to go through the first stages of grievance.

And like I say, the whole process should have lasted, according to the timelines, maybe a month and a half or two months. It’s been probably 14 months, and I still haven’t got a response to the third level grievance. So obviously they’re trying to sort of drag it out and hope that I go away and get tired of it.

Alison Steeves

So when you went on leave, how long did you think you would be on leave for?

Joe Behare

Seven months.

Alison Steeves

That’s what you expected?

Joe Behare

Oh, I didn’t know how long it would last. I expected that that was the end of my job. But I kind of—as I said, I didn’t do anything other than file the grievance. I didn’t quit.

Alison Steeves

Right, so you were on leave, you weren’t expecting to go back, but you had no idea when you might be able to go back if you wanted to?
Joe Behare
Right, if I wanted to.

Alison Steeves
Were you receiving any pay at this time?

Joe Behare
No pay or anything like that, no.

Alison Steeves
So did you eventually get any other income during this time?

Joe Behare
I did eventually get another job—a five-month contract—with a company in Ontario. I worked remotely and that was some time in February. So that was good. It didn’t pay as much but I liked the job and I liked the people that I was working with.

Alison Steeves
What would you say the financial impact has been of being off your federal government job?

Joe Behare
I mean, leaving aside the fact that I was working at that other job, which kind of defrayed a little bit of the financial impact; it was sort of the equivalent of being fined $60,000 or $70,000, right? That was the income that I didn’t receive during that time.

Alison Steeves
This alternative job, it was significantly less?

Joe Behare
Yeah, it was less. I mean, that put a dent in it. But we went through our savings quite a bit. Also, all through the months of November and December of ’21 and January of ’22, we were without an income.

I was looking for work, but it was hard to find work at that time—especially if you were unvaccinated. So, I didn’t know. You know, that’s when we were going through our savings.

Alison Steeves
Did your decision or your views on this matter impact any friendships or relationships with family at this time?
Joe Behare
Unfortunately, yes, it did. Because, as I said, some friends were very supportive, but others were not. I can’t really unsee that now. People who thought that it was okay for this action to have taken place, and to me, I can’t forget that they felt that way. I had some arguments with family members as well, and that’s kind of put a strain on our relationship.

Again, people want to get past it now and say, “Oh yeah, that was then, but get over it.” But I can’t unsee what I saw. Yeah.

Alison Steeves
Would you say that the vaccine passports had a significant impact on your life in any way?

Joe Behare
I wasn’t able to easily travel. For example, my mom is elderly and not well. She lives in Ontario, so I couldn’t hop on a plane to see her. I did go by car a few times, but there was always the worry that you’d get stopped at the provincial border to check your passport and things like that. So there was that: the inability to travel on public transportation. I couldn’t visit my daughter, who lives in the States.

There was this feeling of social exclusion as well, which was kind of harsh.

Alison Steeves
You’re in a small community, correct?

Joe Behare
Yes.

Alison Steeves
So did you feel the impact within the community?

Joe Behare
Yes, especially in the small town that’s right near us. There was this one incident: My wife was on this group for the Green Party, and she made a point about unvaccinated people being sort of excluded and how that was—And how the candidate should be standing up for them as well. Somebody posted, “Well, you know, Meg, we all know you’re unvaccinated and I saw you at the market the other day with no mask on,” it’s an outdoor market, “and it’s disgusting.”

It’s quite hurtful in a small community to have people call you disgusting.

Alison Steeves
So during that time that you’re on unpaid leave indefinitely, couldn’t visit your mother and ostracized by the community, how was your outlook for the future at that time?
Joe Behare
To echo what Bliss said, I felt very—I felt alarmed at what was happening in our country, and I felt like the fact that seeing people going along with this in a public way, but also what the government was being able to do with seemingly no checks from the courts— Or the Charter didn’t seem to matter. I was alarmed and had a fairly dark view of what was going on and I could see that other people were too.

[00:15:00]
The mood in society in general that I saw was depressed. It was a dark time. We even talked about: Where can we go that’s better than this? Is there any other place?

For the first time ever, I contemplated leaving my country, which was pretty despairing.

Alison Steeves
Is there anything else you’d like to add, Joe?

Joe Behare
No, I mean, just that I think— I think that it’s great what you guys are doing here, giving people a chance to go on record and say what has happened. As we move on from this, we run the risk of forgetting what actually—how it was in the darkest time. So it’s good to just put it on record and remember. So thank you for the opportunity.

Alison Steeves
Thank you. I’ll turn it over to the commissioners. Thanks very much.

Joe Behare
All right.

[00:16:22]

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website: https://nationalcitizensinquiry.ca/about-these-transcripts/
ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI’s Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the “intelligent verbatim” transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at https://nationalcitizensinquiry.ca.

PART I

[00:00:00]

Ches Crosbie
Dr. Laura Braden, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Dr. Laura Braden
I do.

Ches Crosbie
Thank you.

Nicolle Snow
Good morning, Dr. Braden. Thank you for being here to give your testimony.

Dr. Laura Braden
My pleasure.

Nicolle Snow
Now, I know that you've prepared a detailed slideshow. And you're going to start with your qualifications, training, and experience. So I'm going to let you get right into the slideshow. I'm going to try not to interrupt. And if I do from time to time, it will probably just be to explain in simpler terms because I know you have a complicated slideshow. So it may be just to explain in simpler terms what you're talking about or to have you do so. So I'm going to go ahead and let you take the floor.
Dr. Laura Braden

Thank you. And again, it’s a pleasure for me to be here today.

Yes, so my name is Dr. Laura Marie Braden, and I have a doctorate in molecular biology with a focus in molecular biology, cell biology and transcriptomics, genomics, functional immunology, proteomics et cetera. So my education and experience started with a degree in cellular molecular biology. I then did another one in neuroscience because I just couldn’t get enough of school and that was followed by a doctorate, as I mentioned, at the University of Victoria in BC, which is my home province.

In my doctorate, I specialized in molecular immunology, with a focus on host parasite interactions. Really understanding the interface between host and pathogens, and these pathogens included virus, bacteria, and parasites. And I used techniques in molecular biology to get a better sense of these interactions. These techniques included transcriptomics, so learning how RNA expression impacts this; genomics, so the genes; functional immunology, so really getting a sense of how cells in the immune system interact with hosts and parasites; and histopathology, microscopy, et cetera.

I was then recruited to come to PEI, the East Coast, and that is my home province now; I’m a proud Islander. And I did my first post-doctoral fellowship in pathology and microbiology. I did another one again in immunology, again really focusing on understanding how the host and the parasite or the pathogen interact. I then got my big girl job—you say that after you do your postdoc—with a private biotech firm. But I maintained a tight connection with the academic world because teaching is a passion of mine; communicating science is a passion of mine. And I had an adjunct—there’s a spelling mistake there, I apologize—an adjunct professorship in the faculty of veterinary medicine in pathology and microbiology.

So getting into what my career was up until 2021: I was the senior research scientist and program lead in molecular biology and biotechnology. I was in charge of development of novel biotechnology solutions, genomics, transcriptomics, again histopathology, functional immunology. And a really important piece of this, which is what I’m going to focus on a little bit later in my talk, is that I have an extensive experience in the GLP environment. And what that means is good laboratory practices, which is what regulatory compliance is all about. So, I know what it takes to go through a proper rigorous regulatory compliance approval process with the FDA and the Health Canada. And so, I have familiarity with regulatory compliance processes, the approval process of new products, and most importantly, what quality control and quality assurance means.

Nicolle Snow

Wow. Okay. Great. So we’re in for a science lesson today.

Dr. Laura Braden

Yes. Okay, so number one—I already mentioned it’s an extreme pleasure to be here. You know, as we got through the beginning of the COVID crisis, from the very beginning, there were red flags for me. And as someone with the understanding and education of, number one, how to read science. Science is hard to read, scientific papers are hard to read. It’s very exhaustive. But with our training, we learn how to do so. I know how to interpret data; I know how to read data. And so, things were popping up that didn’t sit quite right. So it was sort of a professional obligation of mine and those in my profession, I feel, to question the,

[00:05:00]

I’m going to highlight a few things here in the slide and then move on. There’s a lot to talk about. With the brevity and in the interest of time, I would like to focus on a few things.

The first ones I’ve highlighted here. So number one, at the very beginning, there were genomic sequences that were published on COVID that contain some very interesting inconsistencies with the whole concept of natural origin. I also want to talk a little bit about masking and the inconsistencies in the scientific data to support indiscriminate masking of healthy people, asymptomatic spread, and also the use of PCR. I use PCR every day of my life in my career. I troubleshoot PCR. I was talking with the technical support teams of the major biotech firms who were supporting PCR in my lab: I know how to use PCR. And I have some things to say about that. I’m not going to go too much into it, but there was also this demonization of early treatment strategies to control the virus. Never before have we never treated the virus. You always treat the sick people; you don’t send them home. And there was this demonization of early treatment strategies with safe generic drugs that was very upsetting and inconsistent with science.

And finally, I want to point out the last piece here. This whole concept of this novel technology that, in my opinion—which was my initial and very adamant concern—that there was a lack of quality assurance and quality control to ensure there was no contamination in these products. And I fail to this day to see rigorous testing to demonstrably justify its widespread use.

So I’ll move on. The first thing that I saw was early sequence data in 2020 that indicated there were novel genetic inserts in the sequence. And what that means is—We were told from the very beginning that this was a natural born virus that was a zoonotic, so it transferred from a bat to a human. They published the sequence in January of 2020, and then a paper came out, a preprint. So because there’s so much data, we have to get the data out as fast as possible. Preprints are when the authors want to get the information into the realm without going through the exhaustive process of peer review, which can take many months. So a preprint, you have to keep in mind, hasn’t gone through the rigorous testing of peer-review process, but it’s open science: They want comments. They want to get a discussion going, which I will emphasize is the tenet of science. It’s open discussion and discourse. So they want to get this done.

Okay. There was an early sequence analysis indicating there were these interesting novel genetic inserts. And this caught my attention because these inserts showed significant similarity to HIV-1 sequences that were never present before in coronavirus. And that was very interesting to me as a scientist, and I wanted to talk about it. And I was, of course, silenced from my peers, saying this was ridiculous. These sequences, I’ll show here. This is a 3D generation using bioinformatics tools that you can put in a sequence of a protein and you get a rendition of what this protein looks like. So this was the spike protein from this paper. This is the paper from Pradhan et al. Uncanny similarity of unique inserts in the COVID-19 spike protein to HIV-1, gp120, and Gag. And that’s just a lot of talk, saying we found similarities in COVID to HIV. That’s interesting. Let’s talk about it.

The really important piece of this, of course, is that these sites that they found are the sites I’ve highlighted here in red—that are the binding sites. These are the binding sites of the protein, meaning those are the pieces of the protein that would interact with human cells.
So if those are interesting or different and unexpected, let’s talk about it. That might be something to talk about, right? Interestingly enough, those particular proteins that are similar in HIV-1 are Gp120 inserts that facilitate or allow interaction with CD4+ T cells. So this was indicating that SARS-CoV-2 could interact with not just the ACE2 receptors, which we’ve all heard about, but also T cells. And this is a paper talking about it.

Okay. So in addition, they also found the furin cleavage site, and I’ve highlighted those here in green. These are the furin cleavage sites. They again were not present in any other coronaviruses, so this was an interesting finding.

[00:10:00]

And these also facilitate nuclear transport, and we’re going to get into that in a little bit later, but they were different. And they also show that these particular furin cleavage sites were key to pathogenesis. This is what made COVID-19 pathological to humans. So instead of discussing this and engaging in discourse, which is typical of science, this paper was withdrawn over a weekend, and it sort of disappeared into the ether, and we never saw it again. And this was very concerning to me because this contradicts the typical process for discourse after publication. If there’s a paper that’s published, and there’s other authors that have an issue with that, generally what happens is that there’s interactions, there’s comments, there’s letters to the editor, et cetera, but instead of any of that, it was just mysteriously withdrawn.

Nicolle Snow
And so, if I understand what you’re saying, Dr. Braden, there’s early evidence that the signatures on the virus were man-made or synthetic?

Dr. Laura Braden
That’s correct.

Nicolle Snow
And that did not support the theory that it came from bat to human.

Dr. Laura Braden
No. And that evidence continues to accrue. Many papers in the last couple of years have shown that, including a paper by a group of authors that have shown other endonuclease signatures that are recombinant in nature. And so, let’s talk about that. And also, there’s evidence coming out, of course, in the U.S., about this whole concept of lab-made origin. So instead of discussing these potentials in 2020 as a group of peers, people who brought that up were censored. They were taken down off social media sites. And of course, the papers were withdrawn, which is completely antithetical to science.

I’ll move on. So the next thing that really bugged me was how they figured we would stop a mosquito with a chain-link fence. And that’s tongue-in-cheek, of course. But it was the indiscriminate masking of healthy people that never made sense. And it didn’t make sense to a lot of people. But those of us who worked in Level 3 biolabs, work with viruses, know how these things work. It didn’t make sense even more. Yet we saw our colleagues go along with this narrative, which was especially concerning.
So we heard about the masking and how it doesn't make sense in a number of ways. It wasn't supported by science. Public Health said you need to follow the experts and trust the science, and masking is the best way to stop the spread. If you're working with virus, you need to have negative pressure rooms. You need to have flow hoods. You need to have full body suits, proper respirators, not a bedazzled cloth mask. That does not work.

And even then, we know from previous scientific research: this doesn't stop the flu, which is droplets. How could they imagine that masking would stop aerosols, which is COVID? So, it didn't make sense. But then it didn't make sense intuitively. And then large, randomized control studies were then published, one of them being from Denmark, the famous DANMASK study, and then the Bangladesh study. They showed no impact on risk reduction. This is the one from Denmark. And then we finally have, over the last couple years, despite the evidence that they don't stop spread, the meta-analysis by the Cochrane collaboration showing no impact. And I'll quote from the lead author, “The pooled results of the studies did not show a clear reduction in respiratory viral infection with the use of medical/surgical masks.” So I'll move on from that.

Nicolle Snow
Just to summarize: it sounds as though the medical professionals who were indicating we needed to wear masks were ignoring this science.

Dr. Laura Braden
They were. So the next point: moving the goal posts, as they did constantly. This one, that there's sick, perfectly healthy people. And what I mean by that is—asymptomatic people were told that they were sick because they tested positive using a PCR test. And it is my professional opinion that this was used by the media and health bureaucrats to perpetuate the fear in people. Public health, again, did not support this assumption with evidence of any kind. It was never proven that asymptomatic shedding resulted in infectious spread. And even the WHO, the World Health Organization, admitted it was rare. One of the biggest studies to sort of conclude that asymptomatic spread wasn't a thing was a Chinese study, this was published in Nature. Out of the 10 million PCR tests they conducted in Wuhan, 300 of those 10 million were asymptomatic. And out of those 300, 190 people already contained antibodies, so they had already been infected.

[00:15:00]

And out of the 300, none—not one person—produced a live virus in the lab setting, demonstrating high cycling of PCR was generating false positives.

Nicolle Snow
Okay, so the false positives were used to support the asymptomatic spread narrative.

Dr. Laura Braden
Correct. And I'll go through that a little bit more in detail here. I will be clear: PCR detects nucleic acid; it does not detect disease. Never before in my training have we used PCR to show that an animal was sick. PCR is a good diagnostic tool that is always followed up with a confirmatory test of some kind. In a virus setting, if you test an animal and it is positive for PCR—and I will also mention here within the realms and the linearity of the test itself,
which is an important part—you always confirm with either a bacterial culture or a virus culture of some kind.

That was not done in this case. Diagnostic tests need to be interpreted in the context of the patient: So whether or not this person already had COVID, if there was a presence of antibodies already in their blood, meaning they already went through the infection and they just have residual DNA because, again, PCR tests for nucleic acid. Do they have symptoms? Are they sick?

It has been shown conclusively over and over again that high cycles over 30 is detecting such low levels of viral RNA, it does not indicate infectivity. And that’s what they showed with the China study from the slide before. Viral shedding occurs after recovery. DNA is sometimes sequestered, and RNA is sometimes sequestered by our immune system cells weeks after the virus is gone. Is that what is being detected here? We don’t know because they never conducted culture-based methods to confirm the person actually had infectious viral particles. They use PCR cycled at ridiculously high levels, and what I mean by that is the test is only designed to confirm the presence of nucleic acid within a certain range. And that range really shouldn’t be considered past 30, 35 cycles. Yet across Canada, provinces were cycling routinely 40, 45 cycles. That is inconsistent with the science, based on the test.

Nicolle Snow
And so that’s where the false positives come from.

Dr. Laura Braden
Correct.

Nicolle Snow
These are healthy people that may have had the virus at one point. The signature, if you will, is still in their system. And so because they’re cycling is so high, it’s magnifying, revealing that signature.

Dr. Laura Braden
Precisely, yes.

And I’ve mentioned this point previously: PCR detection of viruses is helpful, but it does not detect infectious virus. And this has been shown exhaustively in the literature with many other viruses—that viral RNA can be detected long after the disappearance of the actual infectious virus. And actually, in Portugal, there was a Lisbon Court of Appeal that concluded the PCR test is “unable to determine, beyond reasonable doubt, that a positive result corresponds, in fact, to the infection of a person by the [SARS-2] virus.” And that’s very important. This precedent was being set across the world, yet Canada was not following the contemporary science.

And the next slide is an example of a FOIP [Freedom of Information and Protection of Privacy] request, kindly given to me by Dr. Jessica Rose, from the Newfoundland Public Health showing the threshold is 45 cycles. And that to me in my professional opinion is abhorrent. And it’s hard to find every single province across Canada, but I know that PEI was cycling to 40, I know that Ontario was cycling to 40, so we can assume the rest of provinces followed the same trend.
And that would not be the standard, to be cycling at that level?

Dr. Laura Braden
No.

All right. So those are the pieces that I wanted to talk about in terms of the mandates.

Now I want to get into the quality control and quality assurance—or lack thereof, in my opinion. For an experimental product, we would expect rigorous quality control and assurance that the product we are receiving is consistent, it is transparent, we know what is in it. The necessary steps to approve this gene therapy, which is what it is, were rushed, incomplete, or simply ignored.

The precautionary principle was thrown to the wayside.
